We have written in some detail and with greater frankness because we have thought it wise to make our position clear. The editors of this journal fully realize that the engineering manufacturer is doing a large amount of inventive and research work of the highest interest and value to the constructing engineer and contractor in the field. They are eager to present the work of one to the attention of the other. They must, however, choose the more important from the less, the more available from the less. They are not infallible and doubtless err at times in their choice—giving space to the less interesting and useful. They must at times also be bound by considerations of space and time and trend of interest on their subscribers' part.

Advices from Rutherfordton, N. C., state that the Isothermal Traction Co. has been formed and proposes the construction of an interurban line from Rutherfordton to Gastonia, a distance of 50 miles. The promoters met recently in Rutherfordton and completed plans for the permanent organization of the company. At that time officers were elected as follows: K. S. Finch, president, and general manager; John C. Mills, vice president; J. F. Flack, secretary and treasurer. Other promoters are W. H. Harrill, E. B. Harris, C. F. Greer and Dr. Young. Preliminary surveys are to be made shortly.

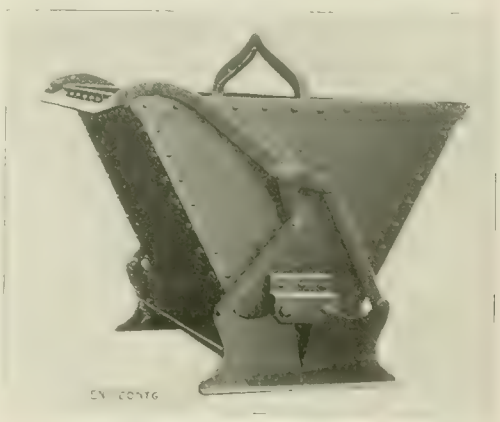
One of the largest private irrigation enterprises ever undertaken has just been placed under contract. The work calls for the construction on the irrigation systems on the Colorado Southern Irrigation Co., to the Canon City, Florence & Pubelo Water Co., and is located in Colorado. The contract was secured by Kenefick, Quigley & Russell of Denver, the contract price being [illegible]

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

A Concrete Bucket with Controllable Center Discharge.

For depositing concrete in forms a bucket is desirable which permits the discharge to be controlled both in speed and in amount and which loses its contents vertically downward. With a vertically downward discharge the concrete is deposited midway between the walls of the forms and flows both ways against them without shock. There is moreover no back kick or recoil due to side discharge to bang the bucket against the forms. Control of the speed and the amount of the discharge permits the concrete to be placed as fast or as slowly as is desired and in small quantities of desired. The bucket shown by the accompanying cut is



Concrete Bucket with Controllable Center Discharge.

a controllable center discharge bucket having several points of merit in the way of simplicity and in the arrangement of the levers controlling its operation.

Referring to the illustration, it will be seen how the bottom gates are so hinged that they open by drawing apart symmetrically right and left. The total width of opening is 12 to 18 ins. and it may be made any width from these maxima down to as narrow as an inch. The action of the gates, it will also be noticed, is positively controlled by the levers; there are no springs or other motion actuating devices. Another point to be noted is that the handle operating the levers is at the top of the bucket. This permits the bucket to be lowered well down between the walls of the forms without placing the handle where it cannot be got at. This tends to reduce the drop of the concrete and waste from splashing when handling wet mixtures. A final important feature to be noted is that when the gates are closed the bucket has a quite wide, flat bottom on which it can stand without braces or supporting platform. This permits the bucket to be set on flat cars and run with its contents from the mixer to any part of the work.

This bucket is made entirely of steel in five sizes, ranging from 15 to 45 cu. ft. actual capacity, and weighing from 390 to 1,140 lbs., according to size. The dimensions of the bucket vary of course with the size. A 1 cu. yd. bucket holding actually 28 cu. ft. stands 51 ins. high and is 49x54 ins. in its largest lateral dimensions. It weighs 800 lbs. These buckets are made by the Acme Equipment & Engineering Co., Cleveland, O.

Results of Tests of Model Concrete Arches Made in Connection with the Design of the Medina Aqueduct New York Barge Canal.*

At Medina, N. Y., the Barge canal will cross a deep gorge and the topography is such that this cannot be avoided. After a careful consideration of various types of steel and concrete aqueducts and also a high earth embankment, it was decided by the State Engineer and the Advisory Board of Consulting Engineers, that a concrete arch of single span, carrying a reinforced concrete trunk with the necessary approaches, is to be preferred to other possible types of construction.

The load to be carried consists of a prism of water, having a maximum depth of 13 ft. 2 ins. and weighing 825 lbs. per sq. ft., in addition to the weight of the trough, piers, and arch ring. The total weight of water to be carried by the single span is 12,400 tons, while the total load, including the weight of the structure, is 46,000 tons. The water load may at times be removed, and is to this extent a live load, although it is always uniform for the full length of the structure and is never accompanied by impact.

The span, center to center, is 290 ft. 6 ins. The clear span of 285 ft. cannot properly be reduced. The rise is 53 ft. 5 ins. The total width of the structure is 129 ft.

Other notably long span concrete arches are the Walnut Lane bridge, Fairmount Park, Philadelphia, and the arch over Rocky River, at Cleveland. The Walnut Lane bridge was completed in 1909. It has a clear span of 233 ft. and a total width of 60 ft. The live load is 100 lbs. per sq. ft. The total live load carried by the structure is 700 tons and the total load, including the weight of the structure, is 12,000 tons. The Rocky river bridge is now being built. It has a clear span of 280 ft. and a total width of 60 ft. It carries a live load of 150 lbs. per sq. ft., a total live load of 1,200 tons and a total load, including weight of structure, of 16,000 tons. It is known that there are other long spans projected, but definite data concerning them are not available at this writing.

Thus it will be seen that by virtue of the length of span, the total width, the great load to be carried and the necessarily great cost, the Medina aqueduct may properly be considered the most important piece of concrete arch construction ever undertaken. It was therefore deemed both advisable and necessary not only to develop the design with the greatest care along the lines of the most approved theory of arch construction, but to make a series of tests on concrete prisms and model arches, for the purpose of obtaining additional information concerning the behavior of concrete under certain conditions of stress.

At the meeting of the American Society of Civil Engineers, held Sept. 15, 1909, a paper was presented, entitled "Walnut Lane Bridge, Philadelphia." This paper contained the following statement:

Tests of concrete model arches, made in order to determine questions of design, indicated that it is wise to treat the components of the direct arch stress at the abutment as so much shear acting in a beam. Regarded as such, the vertical component or reaction at the spring of the main arch ribs of this bridge amounts to

*Arranged from the "Barge Canal Bulletin" for February, 1910.

108 pounds per square inch of arch section in shear at the face of the skew-back, which would be high for simple concrete, but is allowable for the hybrid* material.

There was no discussion by any member of the society challenging this opinion.

To construct at Medina an arch of sufficient thickness to carry the heavy loads and to keep the shear at the low value indicated by the foregoing quotation is decidedly impracticable. Inasmuch as failure by "shear"—or more properly speaking, by "diagonal tension"—in a compression to destruction. Just what is meant in such cases by the word shear is not always clear.

Since no satisfactory evidence could be found of adequate tests ever having been made to prove that the arch would not fail by shear near the spring under shearing stresses of comparatively small intensity, as intimated by the foregoing quotation, it was believed to be still more necessary to obtain further information by tests, both on prisms and on model arches, which should be exact stress, it was considered advisable to include in the series of concrete prisms some which should be loaded eccentrically.

Six model arches, without reinforcement, have already been made and tested to destruction. Three of these were reduced in section near the springing for the purpose of encouraging failure at that point by vertical shear. These tests, on account of certain difficulties with the testing apparatus and other difficulties encountered in making the models, all of which have since been overcome, were

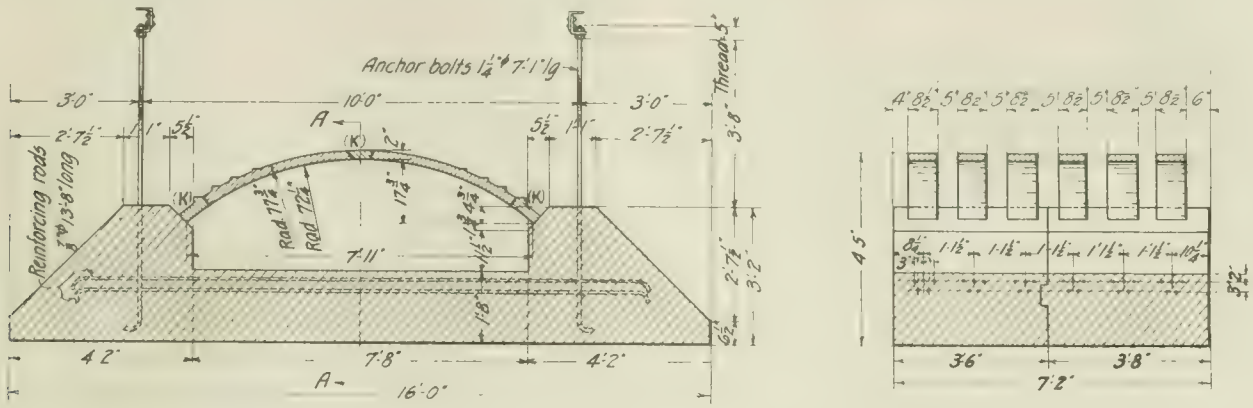


Fig. 1—Elevation Showing Arrangement of Abutments and Test Arches.

reinforced concrete beam has been clearly shown by repeated experiments to commence in the tensile portion of the beam, even where the cracks, once started, extend into the compression side of the beam, and inasmuch as the arch rib should be approximately compared in the nature of its stresses with the compression side of a beam and not at all with the tension side, it is believed that the statement quoted is incorrect and that there is no danger of failure by so-called shear in a properly designed arch. The term shear, as here used, has nothing to do with the phe-

counterparts, except as to size of the ribs of the proposed arch at Medina.

For various reasons it was not believed that the compressive resistance obtained in the test would show the actual unit strength of the full-sized structure. However, it was believed that important information could be secured in regard to the kind of failure and the ultimate strength of arches, as compared with cubes made of the same material, at the same time and by the same experimenter.

It is well known that, on account of the variations of the modulus of elasticity of

not entirely satisfactory and should not be accepted as conclusive in all respects. They will be followed by another series to be made in the near future, the results of which will be published in a future report. The tests already made, however, do conclusively show that, whatever the ultimate cause of failure, it does not occur until the model has developed a high unit resistance in compression. It is therefore evident that, if reasonable values are chosen for the intensity of the allowable working compressive stress per square inch, no attention need be paid to the intensity of

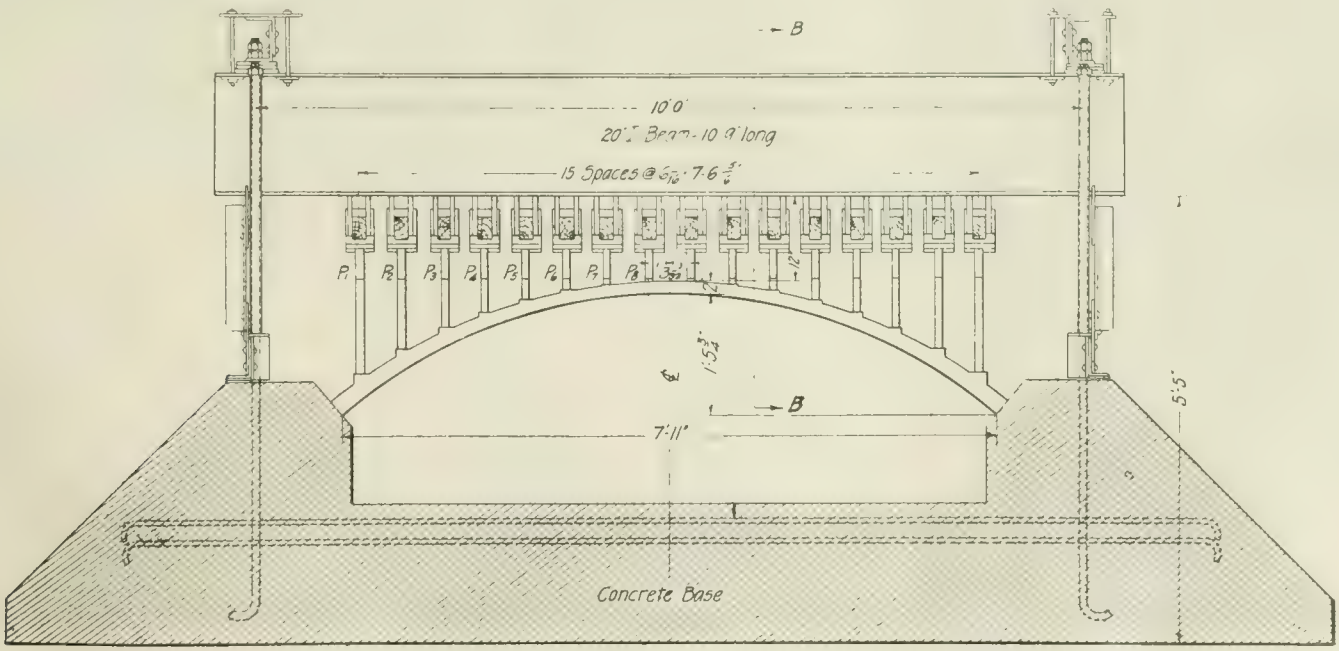

Fig. 2—Sketch Showing Method of Applying Load to Test Arches.

nomena observed in connection with true compression failures under high intensity of stress, and relates only to the possibility of failure along some diagonal plane, before the true compressive resistance of the concrete is fully developed. The literature of concrete frequently refers to the failure of cubes and prisms by shear, when tested by

concrete under varying intensity of stress, the distribution of stress in the compression side of a reinforced concrete beam does not follow the straight line law. It was believed that a similar condition exists under high compressive stress in the case of prisms, columns or arch ribs carrying eccentric loads. In order, therefore, to determine more definitely the allowable working stress in the arch under eccentric stress caused by extreme conditions of temperature and loading, as compared with the allowable average working

the shearing stresses at the springing. A complete description of the apparatus for testing the model arches and a discussion of the results will be found in this article under their respective headings.

When the concrete prisms were tested, a few specimens were provided with diagonal grooves, made for the purpose of encouraging failure by diagonal shear. While the tests are not to be considered conclusive in all points until corroborated by an additional series of tests, which also will be made in the

*Hybrid material, as here used, means concrete in which are embedded flat stones, packed close, with bed of stones at right angles to arch thrust.

near future, yet it is believed that two important conclusions can be drawn at this time, as follows:

(1) Whatever the kind of failure, it does not occur until the prism has developed a high compressive resistance. This conclusion, therefore, amply reinforces the conclusion hereinbefore drawn from the tests on arch

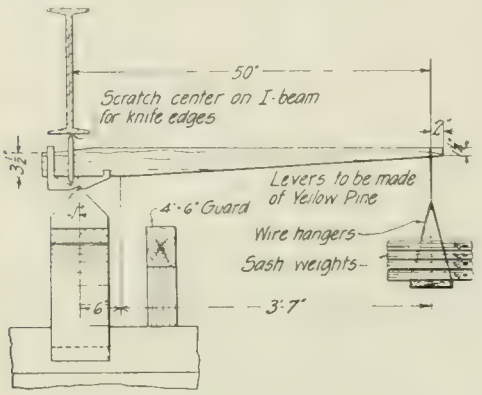

Fig. 3—Section BB of Fig. 2.

models with respect to the danger of failure by shearing near the springing.

(2) The apparent intensity of compressive approximately 33 per cent higher for prisms with one inch eccentricity and over 50 per cent higher with two inches eccentricity. This seems to demonstrate conclusively that the distribution follows substantially the same law as is known to exist for the compression side of reinforced concrete beams. A discussion of the tests on prisms will be found later under its proper heading.

resistance by the extreme fiber under eccentric loading when figured upon the assumption of a straight line distribution of stress, is much higher than the average resistance per square inch for prisms loaded centrally, being

General Description of Arches and Apparatus.—Each dimension of each of the model arches was 1-36 of the corresponding dimension of the proposed Medina arch. The large arch will carry a total average load of about 2,450 lbs. per sq. ft. This load is considerably greater toward the springing than at the crown, on account of the greater thickness of arch rib and the greater weight of the piers which carry the trough. Under this load an average stress of about 500 lbs. per sq. in. will be produced in the large arch and approximately the same stress will exist in the models under the same load per sq. ft. with the same distribution. The weight of the model rib itself is so small as to be almost neglible. If, then, the concrete in the model has an ultimate average strength of 2,500 lbs. per sq. in., an average load of approximately 12,250 lbs. per sq. ft. will be required for destruction. It is impossible to apply so great a direct load with any certainty that the loads are applied as intended. For this reason a system of sixteen independent levers and knife edges (multiplying the loads by fifty) was arranged, as shown in Fig. 2.

The knife edges were made of hardened steel. The special casting for the levers were designed so as to bring the two knife edge bearings and the applied load in the same plane. In this manner the ratio was kept constant and the loads applied to the arch were kept vertical, with errors so slight as not appreciably to affect the results.

The building in which the tests were made was an old shed which had no floor. It was full of cracks and was unheated. The temperatures during the making and testing ranged from about zero to 40 deg. F. However, the models were thoroughly protected and were not frozen.

The abutments were made of 1:3:6 concrete and were cast directly on the ground. They were made massive and were heavily reinforced so as practically to reproduce the unyielding abutments of the large arch. However, there was a slight yielding under the extreme loads required for the destruction of a model and small additional stresses similar to those produced by the rib shortening were thus introduced.

The general dimensions of the model arches and abutments are shown in Fig. 1. In the first series six arches were cast, made of mortar composed of 1 part American Portland cement and 2 parts of Albany sand. In order partially to eliminate stresses due to shrinkage, three sections, or keys, were provided, one at the crown and one at each springing, which were filled two days after the body of the arch was cast.

During the test it was found that some of the keys had not been quite thoroughly filled. This was particularly true of the keys at the springing. The imperfect contact at this point undoubtedly led to lower results than would otherwise have been secured.

begun. The length of time required for this work was considerably greater than had been anticipated and some of the material had taken an initial set before the work was finished. While it is probable that this did not greatly weaken the material, yet the tests apparently showed the effect of the initial set at the time of failure by the splitting of the ribs in several cases along the line of separation between layers.

As might have been expected with a new piece of testing apparatus, certain modifications were found necessary in order to secure the best results. Such modifications as were necessary have been made and the difficulties met with during the first series have been so overcome that the projected series will doubtless be of more value than the first.

When the first arch was tested, the loads were applied by means of sand poured gradually according to a carefully prepared program into bags suspended from the ends of the levers. This plan was generally successful, but on account of difficulties in handling the sand and objectionable dust, cast iron sash weights of various sizes were used for the other tests. These weights were carefully applied, also according to program, by hand, one at a time, so as to avoid shock and keep the line of pressure very nearly in the desired position. The desired ratio of loads was computed after several trials and was so chosen as to keep the line of pressure as close as possible to the axis of the arch at all points. The ratio was approximately maintained throughout the entire application of the loads, the per cent of variation from the ratio constantly decreasing during application.

However, additional bending stresses were

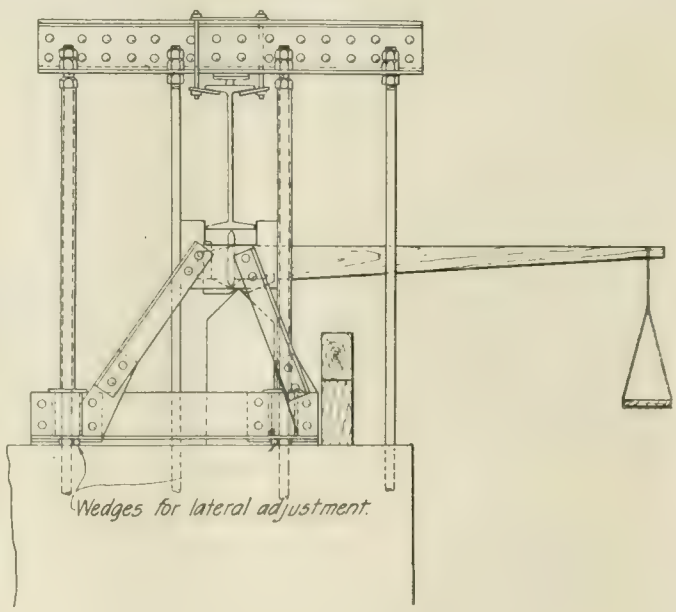

Fig. 4—End View of Fig. 2.

The six arches were cast in one continuous operation. Each arch was constructed in two layers, the first layer of all the arches being deposited before the second layer of any was momentarily produced and the ultimate breaking loads, therefore, were probably slightly less than would have been found, had a more ideal method of loading been followed. All of

the arches had open joints at the keys, caused by shrinkage and fall in temperature. These joints closed under moderate loads.

Arches Nos. 4, 5 and 6 were reduced 38 per cent in section near the springing, in order, if possible, to encourage failure by shear on a vertical plane. The loading for these was identical with that for the others and the eccentricity of the reduced section has been considered in computing the stress on the extreme fiber.

All stresses given in the table are computed for actual loads at time of failure. The formulas used may be found in Church's *"Mechanics,"* Johnson's *"Framed Structures,"* and Turneaure Maurer's *"Principles of Reinforced Concrete Construction."* As is customary, the variation of modulus of elasticity of concrete under varying intensity of stress has been ignored and a straight line distribution assumed. The effect of rib shortening has been included. The effects of shrinkage and temperature are comparatively small and have not been included. Allowance was not made for the reduction of restraint due to the reduction at the springing of models Nos. 4, 5 and 6. The tabular stresses are therefore believed to be somewhat too high.

Detailed Description of Arch Tests.—Arch No. 1 was heavily loaded three times. Sufficient allowance was not made for the deflection of the levers and the 20-in. I-beam was not properly braced horizontally. The multiplying ratio of the levers was therefore maintained only through a portion of the test. The vertical knife edges were thrown out sufficiently to produce a severe horizontal thrust on both I-beam and arch. The arch finally rotated about an axis (M-M, Fig. 5),

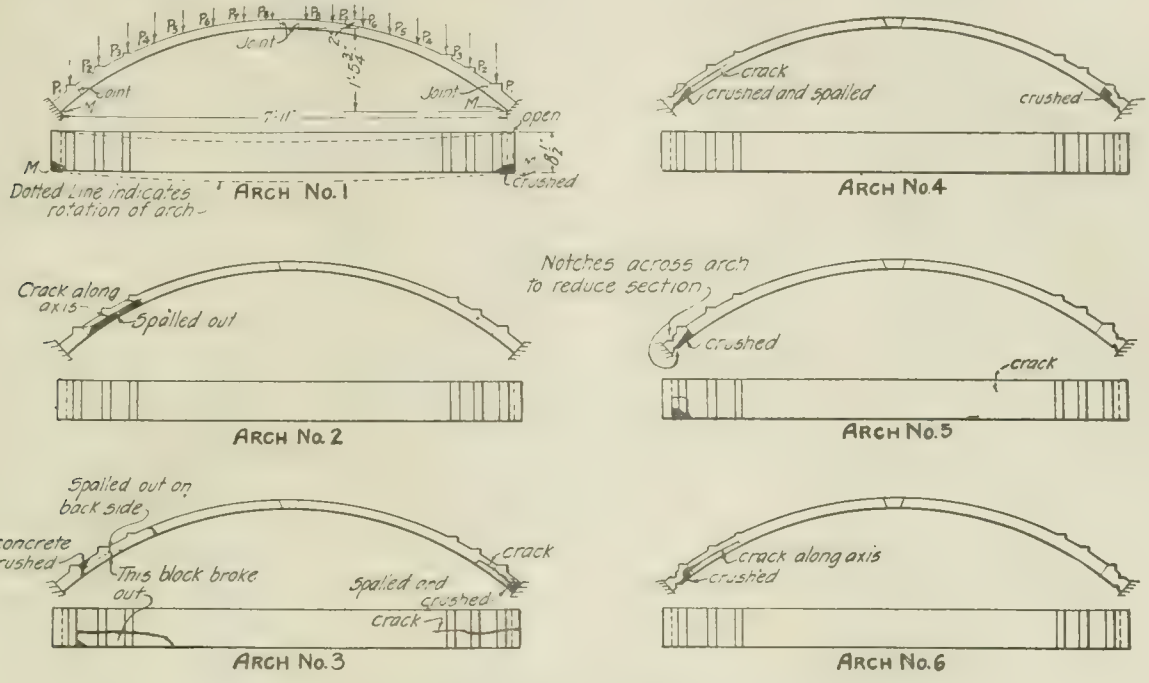

Fig. 5—Diagram Showing Kinds of Failures of Test Arches.

Arch No. 2 first showed signs of failure by splitting along the axis near the key at the springing. On account of difficulties of adjusting the apparatus, not entirely overcome when this arch was tested, the piers were not properly centered on the arch. The eccentricity of loading thus caused, increased the stresses at the extreme fiber by about 20 per cent at the crown and 35 per cent at the springing. Allowance has been made for this eccentricity in computing the tabular stresses. As previously explained, the concrete was deposited in layers and the splitting was encouraged by this fact.

Arch No. 3 failed and collapsed suddenly by crushing at the joint between rib and key at the springing. This arch was accidentally overturned and broken when an adjacent arch failed. It was put together and tested. The contact at the joints was necessarily imperfect and this somewhat accounts for the lower ultimate resistance of this arch as compared with the others.

Arch No. 4, one of the three reduced in section, failed by crushing at the joints between rib and keys at the spring and collapsed suddenly. Before the test began it was seen that the area of contact at these joints was very much reduced by imperfect workmanship. The tabular stress was based on the eccentricity of the reduced sections.

Arch No. 5 was one of those reduced in section. It failed by crushing between the reduced section and the adjacent joint and collapsed suddenly. After failure began, the rib twisted forward and cracked, as shown in plan (Fig. 5).

Arch No. 6 was also one of those reduced in section. The first sign of failure was a crack along the axis just above the key at the springing. This crack grew wider rapidly; it was quickly followed by crushing at the reduced section and a complete collapse.

Six 6-in. cubes were cast of arch material at the time the ribs were cast. They showed an average ultimate strength in compression, at 28 days, of 2,080 lbs. per sq. in. These tests were not entirely satisfactory and are not to be accepted as conclusive.

Description of Prism and Cube Tests.—The results of tests on prisms and cubes are crushing the concrete at these points to such an extent that the model was useless for further tests. It is impossible to determine even approximately the maximum unit resistance developed.

shown in the Table II. In computing the tabular stresses it has been assumed that a straight line distribution of stress obtains and, except where the maximum unit tension is small, that the concrete takes no tension whatever. That the former assumption is incorrect, due to the variation of the modulus of elasticity with variation of stress intensity, is clearly indicated by the fact that the maximum calculated resistance of plain-sided prisms with one inch eccentricity is 34 per cent greater and with two inches eccentricity is 50 per cent greater than with similar prisms centrally loaded. The average calculated resistance for six prisms, both with and without grooves, all having 1½ ins. eccentricity, is 44 per cent greater than the plain-sided prisms centrally loaded.

The theory of distribution of stress in the grooved prisms is complex and the tabular stresses are approximate only, having been computed from the moment of resistance of a plane at right angles to the axis at the point where failure occurred.

Test specimen No. 2 failed at a low load by splitting, on account of the use of too thin a cap plate. Hardened steel plates 2 ins. thick were used on all other prisms.

Much care was taken to secure the greatest possible uniformity in the character of the test specimens. It will doubtless be of interest to notice the great uniformity of the tests, as shown by prisms Nos. 10, 22; 11, 23; and 12, 24.

The value of these tests does not lie in the absolute values obtained in resistance to compression, but in the general conclusions indicated; namely: (1) that, if a straight line distribution be assumed, the working unit stress on the extreme fiber, when the line of pressure passes at the edge of the middle third, may be considered as at least 30 per cent higher than the allowable working stress, when the line of pressure lies on the neutral axis; this will undoubtedly be as true for arches as for prisms; (2) that, if reasonable values be chosen for unit stresses in compression, no account need be taken of so called shear for an arch rib or column sustaining a thrust parallel or nearly parallel to the axis.

Final values of working unit stresses will not be chosen until the second series of tests on both arches and prisms are completed.

A Concrete Cart with a Self-Releasing Leg.

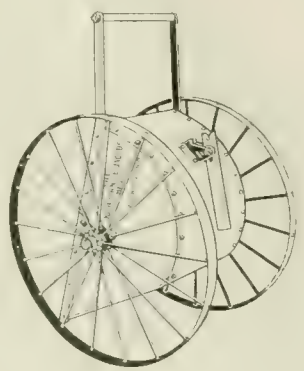
The wide use of hand carts instead of barrows for handling concrete directs attention to any new device that promises additional usefulness to them. In the accompanying cut we show a new concrete cart that is novel in having a leg which swings free either forward or back when the cart is being wheeled or dumped and which becomes fixed and rigid when the cart is standing unsupported. This leg consists simply of a strong bar hung by bolt in a lug bracket bolted to the plate of the cart bowl. The bolt hole in the bar is slotted and the top end of the bar extending above the bolt is notched. When the cart is standing, with the leg vertical, the bolt bears against the bottom of the slotted hole and the notched top engages a projection up inside the lug bracket; the leg is held rigid. Immediately the cart is "raised" for wheeling, the leg drops by its own weight the full length of the slotted hole, its top becomes disengaged and the leg hangs free and will swing aside if any obstruction is encountered. It also swings down against the bowl and out of the way of the wheels in dumping, as shown by the illustration. The leg swings back to "standing" position as the cart is lowered to the horizontal and locks itself automatically as it takes its load. The cart itself is of 6 cu. ft. capacity, weighs 245 lbs. and is 34¼x55½ ins. in lateral outside dimensions. It is manufactured by the Kilbourne & Jacobs Mfg. Co., of Columbus, O.

The Langhorn & Waugh Construction Co. has begun work on its contract for building two miles of yards at Silver Grove, ten miles from Covington, Ky., for the Chesapeake & Ohio Ry.

The Efficiency and Cost of Concrete for the Preservation of Piles Exposed to Sea Water.

It has long been the aim of engineers and builders to find some method of treating or protecting wooden piles or other wood structures from the destructive attack of marine borers, of which the teredo and the limnoria are the chief representatives. Many methods have been tried, and success more or less marked has attended some of them, the principal methods being the chemical treatment of the wood fibre and the mechanical protection of the pile or timber by a protective covering of metal, treated wood or concrete. However, we are only interested in the application of concrete or cement and will pass over the other methods with but brief mention.

Under the head of chemical treatment, creosote should be given first place, which proves very effective until by abrasion or dissolving out, the pile loses its sheath of impregnated creosote and becomes open to attack by the destructive ship worm. A pile so treated is effective for approximately 15 years, if it has received no mechanical injury to split or otherwise damage it. The metal-coated pile, as well as those covered by asphaltic compositions, are open to the same objection as the creosoted pile, but have also the added drawback of a still shorter life.



Concrete Cart With Flexible Leg.

With this brief review of older methods, we will now consider the concrete covering of wooden piles, of which there are quite a variety and several classes, and we will endeavor to describe several, which are more or less practical. We will classify them A, B, C, and D, merely to distinguish them and not according to their relative merits.

Class A.—A wooden pile covered with a jacket of concrete, made by placing a mold around the pile and filling with concrete reinforced with steel or not, as desired, applied before driving. This makes a pile that can be inspected without trouble, but has the drawback in that it is heavy and difficult to handle and drive, and will sink, presenting the same difficulty as a solid concrete pile in this respect. Furthermore, the same precaution must be observed in driving it as in the purely concrete pile. It is difficult to give exact costs, as these will vary with the size of the pile, the length covered on each, the varying cost of materials, the proportion used in the concrete, the use or omission of reinforcing, cost of labor, etc. We will endeavor, however, to give a relative cost of the several methods, so that a comparison of the various classes may be made.

Class B.—This class includes piles covered after they have been driven and before the superstructure has been built. The covering is applied by lowering over the pile a continuous concrete, wood or steel jacket, so proportioned as to leave an annular space between the pile and jacket of from 2 to 4 ins., preferably the latter, this space being then pumped out and filled with concrete.

This method presents some difficulties where deep water is encountered, due to the liability of the jacket to collapse, if built of wood or steel. Furthermore, it is difficult to exclude mud and water if the sea bottom is soft or if the casing is not perfectly tight. It is sometimes found necessary to seal the bottom with cement and allow it to set before pumping out the annular space. This should be as complete as possible for the best results.

Class C.—This is a modification of Class B in that it uses the same type of jacket, with the exception that it is made sectional and in two parts to admit of its application to wharves, already built or where the superstructure is in place. A tile jacket is sometimes used in addition to the others of Class B.

The jacket is applied by placing the sections around the pile and is lowered section by section, by suitable means, until the submerged portion of the pile is covered and sufficient penetration is obtained into the sea water; the annular space is then filled with concrete without first pumping out the sea water. With this style of construction it is impossible to exclude the water and mud, which is a serious drawback. The concrete is liable to be of inferior quality, especially at the bottom, the very point that should be made the most impregnable, the mud line being the principal point of attack of that most destructive of wood borers, the teredo.

Class D.—This is a class distinctly by itself and is of more recent origin than any of the previously described methods of armoring. It consists of a light steel sectional jacket, fitted at the bottom with a self-adjusting diaphragm, made to accommodate itself to the irregularities of the pile. The method of procedure is to fit the bottom section containing the diaphragm around the pile and fill with concrete, the section being suspended from above by suitable means, usually by winches. The first section is then lowered sufficiently to permit the addition of another section, which is filled with concrete; this is repeated until the submerged portion of the pile is covered and the desired penetration is obtained into tthe sea bottom. The annular space between the pile and the jacket should be at least 4 ins. and in large piles of say 18 to 20 ins., 5 or 6 ins.

This method renders the concreting of piles very simple and effective and obviates the principal difficulties of the three other classes of covering. It is especially adapted to the repair of old wharves badly eaten with either the teredo or limnoria. The San Francisco Harbor Board has adopted this latter method for the repair of their old wharves and finds it economical, easily applied and durable. Classes A and B are not suitable for the repair of old wharves, the expense being prohibitive. Between classes C and D, the latter may be applied for approximately 20 per cent less per lineal foot than the former.

For new work, classes A, B, and C would cost approximately the same, with a slight possible advantage in favor of Class A. Class D may be applied to new construction more cheaply than on repair work, and would run 20 to 25 per cent cheaper than any of the other methods.

The San Francisco Harbor Board is paying $1.55 per foot for Class D work on all sizes of piles. This includes profit and royalty, the actual cost ranging from $1 to $1.25 per lin. ft.

*A paper presented by the Healy-Tibbets Construction Co., at the 1910 convention of the National Association of Cement Users.

The Powell Process of Wood Preservation.—A new method of treating wood has been invented and tried with success in Australia according to a report made by Consul John F. Jewell at Melbourne. The essential part of the Powell wood process consists in boiling the wood and allowing it to cool and absorb a saccharine solution, after which it is dried, rendering the wood thoroughly seasoned within a few days after cutting, increasing its strength, and stopping all warping and shrinking. The sap in the wood is driven out and replaced by an antiseptic, owing to the saccharine solution boiling at a higher temperature than water, thus making the wood impervious to dry rot and to the attacks of white ants and other parasites which prey on ordinary lumber.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Methods of Open Cut Rock Excavation at the Pennsylvania R. R. Terminal Station at New York with Some Data on Drill Reformance *

The work described involved the excavation of an approximately rectangular pit having an area of 6.3 acres to a depth of something over 50 ft. The total amount of excavation was 521,000 cu. yds., of which 87 per cent was solid rock. The rock may be classed as gneiss; it varied in character between granite and mica schist. The strata had an inclination of about 60° with the horizontal. The location of the work was between 9th and 10th avenues and 31st and 32d streets in New York city, which was a completely built up area, so that preliminary to excavation some 94 buildings had to be wrecked. The contract included not only the excavation but also retaining walls on all sides of the pit and a large amount of structural steel work. This article refers to the excavation work alone.

The excavation work was divided into two parts: (1) The strip underlying 9th Ave. having an area of 0.9 acre, and (2) the 5.4-acre area between this strip and 10th Ave.

Work Under 9th Ave.—This work involved the excavation of a strip 375 ft. long, the full width of 9th Ave. and 58 ft. deep, and the construction over this area and about 24 ft. below original street surface of a steel viaduct to support the original 9th Ave. structures. These structures comprised 340 ft. of 3-track elevated railway structure, a 2-track street railway, a 48-in. brick sewer, a 24-in. cast iron water main, and various smaller pipes and conduits.

The method of work is shown by Figs. 1 and 2. At first the east side of the avenue was closed and excavated down to rock, the earth was mined out under alternate yokes of the surface railway structure, and temporary posts were placed under the yokes to support the structure while the remainder of the earth was being removed. Then needle beams and posts were placed under each yoke. The concrete forming the track structure was then inclosed with planking to prevent it from cracking and falling. I beams were then placed under the needle beams carrying the structures, and these were carried on posts; they were changed alternately until the excavation had been taken out to a depth of about 16 ft. below the surface. In placing these I beams, heavier blocking was used in the center of the span than at the ends where the bents would come, to prevent the subsidence of the track owing to the sag in the I beams. As much excavation, to a depth of about 20 ft., was taken out adjoining the elevated railway foundations as could be done with safety. The 48-in. brick sewer was broken and the sewage was pumped across the excavation.

The overhead girders, B, were then put in place and two of the girders, C, were used as temporary shoring girders at each column. These were placed parallel to the elevated railway, with blocking between them and the girders, B. Double bents, independent of each other, were placed under the ends of these temporary shoring girders, and these were braced securely to prevent possible dislodgment during the removal of the rock. The weight of the structure was then taken by jacking up the girders near the bents until the column was lifted off the old foundation; blocking was put in between the girders and the bents during the jacking, so that when the jacks were released the base of the column was still clear of the old foundation. One 80-ton jack was used for this purpose.

Temporary raker braces were placed against the structure to prevent lateral movement. Four sets of these temporary shoring girders were used in this manner, two sets starting at the north end and two sets at about the middle of the work, and these sets were moved south as they were released.

The columns being thus supported on temporary shoring girders, the old foundations were removed and the excavation was taken down to a level about 16 ft. below the surface.

Two sets of three of the girders, C, were then put in place under the avenue at each column, each set being placed on four concrete piers 6 ft. square with spaces of 4 ft. between them, so that the outside of the outside pier would be 18 ft. from the center of the avenue and 32 ft. from the house line. This is shown on Fig. 2. Four small piers were used, as they could be more easily removed than one continuous pier. The girders, C, were set to line and grade, and the piers were built under them, great care being taken to get the concrete well under the girders so as to give a firm bearing.

After these girders, C, were in place it was necessary to remove the temporary shoring girders before the bents could be erected on girders C to support girders B, being in the same plane, and provision had to be made to support the structure while this was being done. Therefore double bents were erected directly beneath the columns, as shown by Fig. 2. These were built with their sills resting on the girders, C, and blocking was put in between the sills and the rock to carry the full weight of the structure. Later when the weight of the structure was carried on the permanent bents, this blocking was knocked out, but the bents were left in to carry the weight of the column itself, which was swinging more or less from the structure above. The weight of the structure was placed on these bents directly beneath the columns by jacking up the temporary girders again, putting blocking between the bents and the base of the columns, and taking out the blocking which had been put in previously under the temporary shoring girders. The 24-in. water main was carried over the excavation on cables from the temporary shoring girders, except when they were being jacked up, at which time posts were placed beneath it.

Anchor bolts were put in place between the column bases and the bents directly beneath,

in order to increase the lateral stiffness, and raker braces were also used. This having been done, the temporary shoring girders were moved south to the next column, where the process was repeated. The timber bents were then put in place as shown by Figs. 1 and 2. These bents were framed as tightly as possible, using generally a 20-ton jack, and they were erected simultaneously at each pair of columns. The weight was taken on these columns by jacking up directly beneath the column base and taking out the blocking between this base and the bent directly beneath the column. On releasing the jack the weight was transferred to the permanent timber bents, and the east and west columns of each pair were transferred on the same day. One 80-ton jack was used on the easterly columns and two were necessary on the westerly columns, one on each side of the 24-in. water main. The raker braces of these permanent bents were not framed as tightly as the main posts, in order that the main post should carry the entire weight and the raker braces merely steady the structure.

Timber bents were erected on girders C to the bottom, and at the center of 32d St. it was about 42 ft. high.

It was the original intention to excavate a sufficient width of the sides of the avenue to erect six rows of the permanent steel viaduct, 5 ft. c. to c., and this was done on the south portion of the work. On the north portion, however, the rock was of poor quality, and it was thought best to excavate for only five rows at first, to erect the five rows of permanent steel and put the timber bents in place under the ends of the girders, C, in order to give them some support while the outside concrete piers were being removed and the excavation was being widened out to permit the erection of the sixth row. Additional raker braces were put in these bents temporarily, and were removed when the sixth row of steel had been erected. This is shown on Figs. 1 and 2.

The excavation of the sides of the avenue having been completed and six rows of permanent viaduct girders erected on both sides, timber bents, as shown on Figs. 1 and 2, were erected on this steel to support the ends of the girders, C, and carry the structure while

The work involved covered an area of 5.4 acres excavated to a depth of 50 ft. The stripping of the overlying earth from the rock was done by steam shovel. The plan of rock excavation was as follows: At several points cuts were made to subgrade, and these cuts were widened out to complete the work.

The excavated material was loaded by derricks on cars at the top of the excavation, these cars being on tracks having a direct connection with the disposal trestle. As soon as it could be done, derricks were placed at the bottom of the excavation; tracks were then laid out there, and the excavated material was loaded on cars at the bottom and hoisted by derricks to cars on the disposal trestle. In general, the disposal tracks were maintained about on the center line of 31st St. until the excavation had been carried as close to them as possible, then they were shifted to the extreme north side of the work. A portion of the old trestle was left in place near 10th Ave., a derrick was erected thereon, and the tracks were used for cars to receive the excavated material hoisted from sub-grade. The disposal trestle was maintained in this position

carry the I beams under the surface railway structure, as shown on Fig. 3, and all temporary posts under these I beams were removed. The bents were framed with a jack, as tightly as possible, and very little settlement of the track occurred. A cradle was then built under the 24-in. water main and placed on girders C, and, as a temporay footwalk had been constructed on the west side of the avenue, it will be seen that all structures were thus carried on girders C.

All structures were put on the girders, C, before continuing the excavation on the sides of the avenue because, in case of a slide of rock, there would be less danger than to individual structures. The outside piers, on which the girders, C, rested, might even be lost, without affecting the stability of the structure, and posting could readily be done beneath these girders in case of necessity.

All structures then being supported on girders C, which were carried on four concrete piers resting on the central rock core, the excavation on the sides of the avenue was continued down to sub-grade and the east and west portions of the concrete north abutment were constructed. The central rock core was about 36 ft. wide on the top and 45 ft. wide on the rock core was being excavated. Four 80-ton jacks were used, and oak blocks were placed on the top of each jack to transmit pressure to a temporary oak cap under the girders, C, independent of the bents; all four of these jacks were operated simultaneously, and the girders, C, were lifted off the bents and clear of the concrete piers. Oak filling pieces were then inserted between the bents and the girders, C, so that when the jacks were released the girders, C, were clear of the concrete piers. Elevations were taken on each set of girders during each operation, and careful observations were made on the elevated railway columns. Where the rock was very close to these bents, the open space between the posts was filled with blocking so that there would be less danger of the bent shifting if struck by blasted materials.

All structures being carried on girders C, which, in turn, were carried on the sides of the permanent viaduct, the central core was excavated. Fig. 1 shows the work at this stage. The central portion of the viaduct was then erected, and using concrete piers and timber bents all structures were placed on its deck.

Work Between Ninth and Tenth Avenues.—until such time as it would interfere with the excavation, and then the tracks were abandoned. This was done on Nov. 11, 1908. On Aug. 30, 1908, a cut was made under 9th Ave. at sub-grade, and cars could then be run from 7th to 10th avenues at sub-grade. On Oct. 24, 1908, the connection with the disposal trestle east of 9th Ave. was abandoned, and all excavated material was hoisted from sub-grade at 10th Ave. by derricks.

Practically all the earth excavation, amounting to about 57,000 cu. yds., was done with steam shovels. The average quantity of earth excavated by a steam shovel per 10-hr. shift was 180 cu. yds. This material was loaded on side-dump cars and taken to the disposal pier, where it was dumped through chutes to the decks of scows. Inasmuch as the quantity of earth excavation was small, as compared with the rock, the earth was used principally for the first layer on the scows for padding, so that small stones might be dumped through the chutes without injuring the decks.

The rock broke better on the south than on the north side, where there were several slides, and considerable excavation had to be taken out beyond the neat line required in the specifications. The rock on the south side

broke very well, and there were no slides of any consequence.

The drill holes were laid out by the blaster and the general method of drilling for different classes of work was as follows: In breaking down, the holes were started about 8 ft. apart, on a slight batter, so that at the bottom they would be considerably less than 8 ft. apart. They were drilled about 10 ft. deep, and blasting logs were used, as it was necessary to load quite heavily in order to lift the material and start the cut. After the cut had been made, side holes were shot to widen out sufficiently to start another cut.

After a side cut about 20 ft. deep had been made, the side holes were drilled 20 ft. deep and the holes were loaded and tamped for the full 20-ft. cut. Under the terms of the specifications, the contractor was required to complete the excavation on the sides by drilling broaching holes.

The maximum length of drill steel was about 20 ft. and where the excavation plane of broaching was more than 20 ft. in depth the contractor was permitted to start the holes back of the broaching line, in order to allow for setting up the drills on the second lift. A distance of about 8 ins. was usually allowed for setting up a drill. The broaching line was painted on the surface of the rock in advance of the drilling, and the batter of the drill was tested with a specially designed hand level in which the bubble came to a central position when the face of the level was on the required batter. Holes were also drilled in front of this broaching line and when the excavation had been taken out to within about 6 ft. in front of it, the holes immediately in front were loaded, and also about every third one of the broaching holes, and unless the rock was very bad it usually broke sharply at the broaching line. Occasionally the broaching holes which were not loaded were filled with sand, which gave rather better results than leaving them open.

In the steam shovel work on the east side of 9th Ave. spring holes were used. They were formed by drilling a 20-ft. hole and exploding at the bottom of it, without tamping, two or three sticks of dynamite, and repeating this process with heavier charges until there had been formed at the bottom of the hole a large cavity which would hold from 100 to 200 lbs. of dynamite. Face holes and breast holes were also drilled, and it was possible by this method to drill and break up a cut 20 ft. deep and 15 ft. thick. The only place where spring holes were used on this work was on the east side of 9th Ave., where the heavy cutting was sometimes extended beyond the east house line.

From the best records obtainable, the average progress in drilling was about 33 lin. ft. per 8-hour shift. The average number of cubic yards of excavation per drill shift was 13.9, and the average amount of drilling per cubic yard of excavation was 2.4 ft.; this covered more than 27,000 drill shifts.

The dynamite was practically all 60 per cent and the average excavation per pound of dynamite was 2.2 cu. yds. The contractor employed an inspector of batteries and fuses, who, using an instrument for that purpose, tested the wiring of each blast prior to firing, in order to discover any short circuits, and thus prevent the danger of leaving unexploded dynamite in the holes.

The average quantity of excavation per derrick shift of 10 hours, covering 7,400 shifts, 87 per cent of the excavation being rock, was 50 cu. yds., and the average force per shift, including only foreman and laborers, was 13 men. It was found that a derrick operating at the top of a 20-ft. cut would handle about 40 cu. yds. per shift, whereas if operating at the bottom of the cut, it would handle about 60 cu. yds. per shift. The elevator derricks at 10th Ave. were very efficient, and each could take care of the material from four derricks at the bottom, hoisting 250 cu. yds. per shift a height of 60 ft.

The Portland R. R. Co. of Portland, Me., will commence work in April laying new loop tracks in Portland.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Method and Cost of Constructing a Shell-Macadam Pavement at Annapolis, Md.

Southgate Ave. and Franklin St. extended, at Annapolis, Md., are paved with a combination of oyster shells and broken stone, the shells being used as the bottom course of the pavement. The work was done late in the fall of 1908 under the direction of Mr. J. C. Little, city engineer, to whom we are indebted for the following information. The grading and tarring of the street was done by the contract, the remainder of the work being accomplished by day labor.

The contract price for the grading was 50 cts. per cu. yd. and the contract price for the tarring was 12 cts. per sq. yd. The street bed was graded very carefully so as to conform to the finished surface of the street, the sub-grade being 6½ ins. below the finished grade. The sub-grade was thoroughly rolled with a 10-ton roller and depressions that appeared were filled up with clay, sand, or cinders that had been thrown to the site for that purpose while the street was being graded or rerolled. After the sub-grade was completed the oyster shells were spread from a dumping board to a depth of about 6 ins., great care being taken to see that they were spread uniformly. These shells were then rolled with the 10-ton roller until they were thoroughly compacted. In some places where they did not readily compact, a little sand or cinder was spread over the shells and rolled again, no water being used. The shells after being rolled were 3½ ins. thick and this composed the first course of the macadam. The No. 2 broken limestone was then spread over the shells to a depth of about 4 ins. and rolled thoroughly so that the stone would be 3 ins. thick before the third course, composed of tarvia and screenings, was added. The screenings were spread and rolled as in the construction of any other class of macadam. This macadam was completed late in the fall and opened to travel all winter. It was not covered with the tarvia "A" until the following August. As a result of the traffic on the street, there was considerable clay and dirt that accumulated on the macadam from the unpaved streets adjoining. Hence the tarring of the street cost 12 cts., which is more than it would have cost under ordinary circumstances.

The detailed cost of the work was as follows:

	Total.	Per sq. yd. Pavement.
Oyster shells, 16,125 bu. at 3½ cts., including hauling	$ 564.38	$0.1096
Oyster shells, 3,875 bu. at 3¼ cts., including hauling	125.94	.0245
Stones and screenings, 1,016.05 tons	493.64	.0959
Freight on stone	812.72	.1579
Unloading and hauling stone	406.42	.0789
Spreading and rolling shells and stone	386.00	.0750
Hauling screenings, watering, etc.	47.52	.0092
Cleaning up streets and incidental work	25.00	.0046
Total	$2,861.62	$0.556

The total amount of pavement was 5,146.7 sq. yds. There was 689 cu. yds. of grading, which at the contract price of 50 cts. per cu. yd. cost $344.50, or about 6.7 cts. per sq. yd. of pavement. The tarring with tarvia A cost 12 cts. per sq. yd., making the total cost of the completed pavement 74.3 cts. per sq. yd.

Common labor was paid $1.25 for an 8-hour day and a team and driver cost $2.50 per day. The pavement has given good satisfaction and Mr. Little considers it an excellent type for a residential district.

Work of the Municipal Asphalt Repair Plant of Brooklyn, N. Y., in 1909 with Detailed Costs of the Repair and Maintenance of Asphalt Pavements.

The municipal asphalt repair plant of the borough of Brooklyn, New York city, is located on the 7th St. basin of the Gowanus Canal near 2d Ave. It has a capacity of 270 cu. ft. of wearing surface and 100 cu. ft. of binder per hour, and is equipped with self contained rotary driers, two of which are used for heating sand and one for binder stone. The cylinders of these driers are 40 ins. in diameter, 19 ft. 5 ins. long, with longitudinal vanes. Each set is so arranged that they may be driven independently or at the same time. The driers discharge into an elevator, fitted with 10x6-in. buckets, which convey the material to the respective storage bins above the mixing boxes, from whence the material is drawn by gravity into the weighing boxes, which rest on platform scales, so that each batch of material can be accurately weighed. These scales are fitted with double beams, so that the amount of dust used in each batch of wearing surface may also be accurately weighed with the sand. The weighing boxes discharge into the mixers, which have a capacity of 9 cu. ft. of wearing surface mixture and 10½ cu. ft. binder. The mixers discharge by gravity into trucks driven directly underneath, and are so arranged as to permit of running out both top and binder simultaneously.

There are three melting tanks of 1,500 gals. each, inclosed, and capable of withstanding 15 lbs. pressure, and equipped with mechanical agitators. These tanks are so arranged that any of the three or all of them may be used for the asphaltic cement supply to either one or both of the mixers. The asphaltic cement is fed into the weighing buckets by air pressure through standpipes from the bottom of each tank, rising above the level of the mixing floor, so as properly to discharge into the weighing buckets, which run on overhead trolleys and are equipped with double beam scales.

The power plant has a 60 h. p. Babcock & Wilcox water tube boiler. The plant is driven by a 10x12-in. automatic cut-off center crank engine, manufactured by the Erie Engine Works, Erie, Pa. Since it is desirable to have the power for agitating the tanks independent from the main engine, so that the tanks may be charged and agitated without running the rest of the plant, there is also a 5-in. by 5-in. vertical automatic cut-off engine of 9 h. p.

The plant value on Jan. 1, 1909, was $41,016.10, and during 1909 the following betterments were made:

Manganese link chain	$ 127.00
Skylight over engine room	42.00
Tools and gang equipment	634.32
Miscellaneous	21.50
Total	$ 824.82

This makes the total plant value $41,840.92.

The plant was placed in operation on June 13, 1907, and data on the cost of its operations for that year, together with a description of the plant, were given in our issue of May 27, 1908.

The plant is operated under the general direction of Mr. John C. Sheridan, chief engineer, Bureau of Highways, of the borough of Brooklyn, and we are indebted to him for the following data on the work of the plant for the year ending Dec. 31, 1909.

The fixed charges for the plant for 1909 were as follows:

Interest on payments on betterments at 5 per cent	$ 9.32
Interest at 5 per cent and depreciation on plant at 10 per cent for 1 yr. on $41,016.10	6,152.41
Rent on plant and grounds	1,440.00
Taxes for 1909	608.23
Total fixed charges	$8,209.96

During 1909 the plant turned out 23,113 boxes of wearing surface mixture and binder, the total plant product in cubic feet being 203,496.5. Of the above amount 158,217.5 cu. ft. was wearing surface mixture and 45,279 cu. ft. was binder. A total of 18,082 boxes of wearing surface mixture, 8.75 cu. ft. to the box, was turned out. The binder amounted to 5,031 boxes of 9 cu. ft. each. The wearing surface and binder were used for maintenance repairs to pavements and for restoring openings in pavements, the amount of each kind of work done during the year being as follows:

	Wearing Surface boxes.	Wearing Surface cu. ft.	Binder boxes.	Cu. ft.
Maintenance	13,078	114,432.5	3,163.5	28,471.5
Restoring openings	5,004	43,785	1,867.5	16,807.5
Totals	18,082	158,217.5	5,031	45,279

In addition the street gang constructed 1,704.23 sq. yds. of concrete in connection with the maintenance work and 13,380.32 sq. yds. in connection with restoring openings in pavements. The cost of the concrete material was as follows:

774 cu. yds. stone at $1.00	$ 774.00
1,372 bbls. cement at $1.25	1,715.00
77 cu. yds. sand at $0.75	57.75
501 cu. yds. sand at $0.45	225.45
23 cu. yds. sand at $1.00	23.00
Total cost concrete materials	$2,795.20

The quantities and cost of the materials used for the 18,082 boxes (158,217.5 cu. ft. loose measurement) of wearing surface were as follows:

Refined asphalt, 1,420.854 lbs., at $23.50 per ton	$16,695.03
Refined asphalt, 154,586 lbs., at $25 per ton	1,932.32
Residuum oil, 525 gals., at $0.07⅜	38.68
Residuum oil, 18,609.08 gals., at $0.09	1,674.82
Stone dust, 264.925 tons, at $2.84	752.38
Stone dust, 192.20 tons, at $3.15	605.42
Labor unloading stone dust	50.53
Sand, 1,015 cu. yds. at $0.85	862.75
Sand, 6,166 cu. yds., at $0.87	5,364.42
Total cost wearing surface materials	$27,976.35
Deduct credit on 444 empty oil barrels returned, at 50 cts. each	222.00
Total actual cost	$27,754.35

TABLE I.—SUMMARY OF COSTS OF MAINTENANCE WORK.

	Wearing Surface.	Binder.	Concrete—Total.	Concrete—Per sq. yd.	Concrete—Total.
Supervision and fixed charges	$ 5,872.02	$ 1,420.41	$ 22.58	$0.013	$ 7,315.01
Supplies, repairs, etc.	6,112.56	1,477.35	16.81	.009	7,606.72
Materials	20,073.21	2,792.75	315.28	.185	23,181.24
Plant labor	10,583.65	2,559.27	.....	....	13,142.92
Street labor	28,292.79	6,842.65	737.44	.433	35,872.88
Trucking	7,270.33	1,758.91	165.00	.097	9,194.24
Grand total	$78,204.56	$16,851.34	$1,257.11	$0.737	$96,313.01

From the above figures it will be seen that the unit cost of the materials in the wearing surface mixture per cubic foot loose was as follows:

	Per cu. ft. Loose.
10 lbs. asphalt at 1.18* cts.	$0.117
.12 gal. oil at 7.79* cts.	.009
5.9 lbs. stone dust at .15* cts.	.009
.045 cu. yds. sand at 86.7 cts.	.039
Total wearing surface per cu. ft., loose	$0.175

*Average unit price.

The quantities and cost of the materials used for the 5,031 boxes (45,279 cu. ft. loose) binder mixture were as follows:

Refined asphalt, 144,484 lbs., at $23.50 per ton	$1,697.69
Refined asphalt, 16,000 lbs., at $25 per ton	200.00
Flux (residuum oil), 1,850 gals., at $0.09	175.50
Binder stone, 601.5 cu. yds., at $1.40	842.10
Binder stone, 1,339 cu. yds., at $1.14	1,526.46
Total cost binder materials	$4,441.75

The unit cost of the binder materials per cubic foot, loose, figures out as follows:

	Per cu. ft. Loose.
3.54 lbs. asphalt at 1.18* cts.	$0.042
.043 gal. flux at 9 cts.	.004
.043 cu. yds. binder at $1.22*	.052
Total cost material per cu. ft., loose	$0.098

The cost of labor at the plant was as follows:

	Total.
Foremen 300.25 days at $6	$ 1,801.50
Foremen 69.25 days at $4	277.00
Engineers 461.59 days at $4.50	2,077.17
Stokers 966.86 days at $3	2,900.58
Asphalt workers 4,100.89 days at $2.50	10,252.23
Laborers 689.25 days at $2.50	1,723.12
Clerk 6.00 days at $2.100 per year	40.38
Total for the year	$19,071.98

The cost of the street labor for the maintenance repairs, restoring openings, concrete work and filling and repairing trenches was as follows:

Foremen 2,341.04 days at $4	$ 9,364.17
Engineers 1,587.30 days at $4.50	7,142.84
Asphalt workers 13,678.05 days at $2.50	34,144.60
Asphalt workers 5,699 days at $2	11,398.00
Laborers 68.50 days at $2	137.00
Total for the year	$62,186.61

This street labor cost was distributed as follows:

Maintenance work	$35,135.44
Restoring openings	14,098.28
Vacations	1,791.49
Filling and preparing trenches	1,290.15
Concrete work in maintenance	737.44
Concrete work in restoring openings	9,133.81
Total	$62,186.61

The cost of trucking for the year was $17,308.48, teams and trucks being employed for 2,884.747 days at $6 per day.

The following is a general summary of the expenditures for the year, including fixed charges, supervision, labor, materials and supplies:

TABLE III.—SUMMARY OF THE COSTS OF RESTORING PAVEMENT OPENINGS.

	Wearing Surface.	Binder.	Concrete—Total.	Concrete—Per sq. yd.	Concrete—Total.
Supervision and fixed charges	$ 2,246.80	$ 837.60	$ 316.18	$0.024	$ 3,400.58
Supplies, repairs, etc.	2,336.87	872.12	223.31	0.017	3,432.30
Materials	7,681.14	1,649.00	2,479.92	0.185	11,810.06

Totals	$18,701.97	$49,233.72	$13,906.49	23,113	$3.54	23	60	17

Labor:	
Superintendent asphalt repairs	$ 2,543.27
Superintendent's automobile (operation)	1,778.66
Plant labor, including foremen	19,071.98
Street labor, including foremen	62,186.61
Trucking	17,308.48
Repairs to plant	2,092.22
Repairs to tools	1,144.35
Materials:	
Wearing surface mixture	27,754.35
Binder materials	4,441.75
Concrete materials	2,795.20
Hardwood, 147.91 cords, at $8	1,183.28
Hardwood, 14.98 cords, at $10	149.80
Pea coal, 211.5 tons, at $3.79	801.58
Pea coal, 328 tons, at $3.98	1,305.44
Egg coal, 77.25 tons, at $6.49	501.35
Rosendale cement, 99.33 bbls., at $1.10 less cr. on 242 bags returned, at .07½ cts	91.11
Kerosene oil, 1,540 gals., at $0.09½	146.30
Machine oil, 565 gals., at $0.18	101.70
Cylinder oil, 234 gals., at $0.30	70.20
Waste, colored, 360 lbs., at $0.05	18.00
Waste, white, 560 lbs., at $0.06½	36.40
Albany grease, 370 lbs., at $0.07	25.90
Miscellaneous supplies	237.08
Dumping privilege, 2,337½ loads, at $0.58	1,355.65
Total expenditures	$147,140.66
Total fixed charges	8,209.96
Grand total	$155,350.62

For restoring openings in pavements 5,004 boxes of wearing surface and 1,867.5 boxes of binder were used. The cost of trucking for restoring openings was $4,877.25, and the cost of street labor was $14,098.28. In addition 13,380.32 sq. yds. of concrete was constructed.

A summary of the costs of restoring openings is shown in Table III, and a further analysis of the costs is shown in Table IV.

TABLE IX.—COMPARATIVE COSTS OF MAINTENANCE OF ASPHALT PAVEMENTS PER SQ YD. OF TOTAL YARDAGE OUT OF GUARANTEE, TOGETHER WITH UNIT PRICES FOR WORK.

	Municipal Asphalt Plant.			Contract System.					
	1909.	1908.	1907. July 1 to Dec. 31.	1907. Jan. 1 to July 1.	1906.	1905.	1904.	1903.	1902.
Unit prices	$0.608	$0.544	$0.552	$0.81½	$0.56	$0.67	$0.87	$0.95	$0.90
Prices, binder	0.597	0.737	0.745	0.35½	0.25	0.30	0.40	0.40	0.50
All streets	0.028	0.0384		0.0559	0.0350	0.0345	0.0422	0.0732	0.0579
Railroad streets only	0.089	0.0637		0.1390	0.0630	0.0720	0.0681	0.1435	0.1780
Non-railroad streets	0.021	0.0353		0.0481	0.0321	0.0314	0.0392	0.0644	0.0418

The following is a summary of costs of maintenance for the year 1909 of all the asphalt pavement in the borough of Brooklyn out of guarantee:

	Yardage.	Total cost.	Cost per sq. yd.
All streets	3,227,929	$91,386.21	$0.028
R. R. streets	348,240	30,877.10	0.089
Not R. R. streets	2,879,689	60,509.11	0.021

The accompanying table, Table V, shows the monthly costs, product and box costs for the year. Table VI shows the comparative unit costs of asphalt repairs in connection with maintenance work for three years and Table VII shows the comparative unit costs of asphalt repairs in connection with restoring pavement openings. Table VIII shows the cost of maintenance of asphalt pavement in 1909 and Table IX shows the comparative costs of maintenance of asphalt pavement per square yard of total yardage out of guarantee, together with unit prices for the work. The unit prices are per cubic foot of material measured in trucks, delivered on streets. The costs of maintenance are given per square yard, and are the total cost divided by the total yardage in the respective classes.

Trucking	0.933	0.896	0.710	0.934	0.896	0.710	0.107	0.102	0.081	0.103	0.100	0.079
Grand total	$7.454	$7.382	$6.021	$6.701	$6.631	$5.370	$0.852	$0.844	$0.688	$0.745	$0.737	$0.597

As previously stated, 13,078 boxes of wearing surface and 3,163 boxes of binder were used in connection with the maintenance repairs to pavements. The cost of trucking in connection with surfaces and binders for the work was $9,029.24, and the cost of street labor was $35,135.44. In addition 1,704.23 sq. yds. of concrete were laid in connection with the maintenance work. A summary of the costs of the maintenance work is shown in Table I.

A further analysis of the costs for this maintenance work is shown in Table II.

TABLE VIII.—COST OF MAINTENANCE OF ASPHALT PAVEMENT, YEAR 1909.

Year laid.	Material used in repairs, 1909. Cubic feet wear surface.	Cubic feet binder.	Total cost.	Yardage.	Years out of guarantee.	Cost of maintenance per sq. yd.

Suggested Standard Specifications for Macadam, Brick, and Granite Block Pavement, Creosoted Wooden Block Pavement and Concrete Pavement.

(Continued from March 9 issue.)

GRANITE BLOCK AND SIMILAR STONE BLOCK PAVEMENTS.

The committee in considering this question decided at this time to only recommend certain dimensions and features in regard to the blocks themselves, rather than a complete set of specifications for this form of pavement. It is believed that the adoption of certain standard dimensions for the blocks will result in having the several quarries improve the output of paving blocks and enable them to furnish a standard block more expeditiously, and it is hoped that not to exceed the cost which now maintains.

Dimensions of Blocks.—1st. It is recommended that the depth of block be 5 ins., with an allowable variation of ¼ in. greater or less in said depth.

2d. The blocks shall be so dressed that they can be laid with ½-in. joint for a distance of 1 in. down from the head, the individual joints to be measured, the joint not to exceed ½ in. at the top nor to be more than 1 in. in any part of the joint.

3d. The block to be from 8 ins. to 12 ins. in length.

4th. The block to be from 3½ ins. to 4½ ins. in width for ordinary conditions, with a suggestion of greater width to be allowed for streets of flat grades, said width to be specified in each individual contract.

5th. The head of the block shall be so dressed that it shall not have more than ⅜ in. depression from a straight edge laid in any direction across the head and held parallel to the general surface of the block.

CREOSOTED WOODEN BLOCK PAVEMENT.

The committee appointed for the purpose of

drafting standard specifications for creosoted wooden block pavement consisted of George W. Tillson, chief engineer, Bureau of Highways, Manhattan, New York city; Andrew Rinker, chief engineer, Minneapolis, Minn.; George S. Smith, commissioner of public works, New Orleans, La.; N. S. Sprague, superintendent Bureau of Construction, Pittsburg, Pa.; James C. Travilla, member Board of Public Improvements and street commissioner, St. Louis, Mo.; Thos. F. McGilvray, city engineer, Duluth, Minn.; William F. Harvey, assistant engineer, Board of Local Improvements, Chicago, Ill.; H. L. Conway, engineer in charge Street and Sewer Repair Department, Cincinnati, Ohio; J. K. Mitchell, general assistant city engineer, Detroit, Mich.; Albert F. Keeney, president, Board of Local Improvements, Chicago, Ill.

The committee recommended the following as the principles upon which specifications shall be drafted, the idea being that these principles would be sufficient to enable any manufacturer to make a block that would conform to the specifications and at the same time permit the local engineer to adapt same to conditions in his particular city.

Timber.—The wood to be treated shall consist of long leaf yellow pine, Norway pine, black gum and tamarack, only one kind of wood, however, to be used in any one contract.

Yellow pine blocks shall be cut from what is known as prime timber, namely, all timber must be sound commercial long leaf yellow pine, well manufactured, full size, saw butted, all square edge, and shall be free from the following defects: unsound, loose and hollow knots, worm holes and knot holes, through shakes and round shakes that show on the surface. In yellow pine timber the annual rings shall average not less than six to the inch measured radially from the center of the heart.

Norway pine block, gum and tamarack blocks shall be cut from timber that is first class in every respect, and shall be of the same grade as that defined for the yellow pine.

Size of Blocks.—The blocks shall be from 5 to 10 ins. long, but shall average 8 ins.; they shall be 3½ and 4 ins. in depth according to traffic; they shall be from 3 to 4 ins. in width, but all blocks in one street or improvement shall be of uniform width, provided that blocks 3 ins. in depth can be used on residential streets and in alleys; provided further that in no case shall the width and depth of the blocks be equal.

A variation of 1/16 in. shall be allowed in the depth, ⅛ in. in the width of the blocks.

Treatment.—The blocks shall be treated with a preservative oil elsewhere described, so that the pine and tamarack blocks shall contain not less than 20 and the gum blocks not less than 22 lbs. per cubic foot.

The oil used shall be a coal tar product, free from adulteration of any kind whatever, and shall comply with the following requirements:

1. The specific gravity shall be at least 1.10 at a temperature of 38 degrees C.

2. Not more than 3 per cent of the oil shall be insoluble by hot continuous extraction with benzol and chloroform.

3. On distillation, which shall be made exactly as described in Bulletin No. 65 of the American Railway Engineering and Maintenance of Way Association, the distillate shall not exceed 2 per cent up to 150 degrees C. and 35 per cent up to 315 degrees C. The mean of three determinations to be taken.

The manufacturer of the oil shall permit full and complete inspection and sampling at the factory at which the oil is produced, of all materials either crude or refined entering into the manufacture of the finished product, as well as the finished product itself, in order that the materials used can be determined to be in accordance with the foregoing requirements. He shall also submit satisfactory proof of the origin of all materials entering into the composition of the finished product.

Oil samples taken by the inspector from the treating tank during progress of the work shall at no time be allowed to show an accumulation of more than 2 per cent of foreign matter, such as sawdust and dirt.

Due allowance shall be made for such accumulation of foreign matter by injecting an additional quantity of oil into the blocks.

Cushion.—The blocks shall be laid on a sand cushion 1 in. in thickness placed upon the concrete foundation.

Filler.—The joints between the blocks shall be filled with pitch or fine sand, the particular kind to be determined by the local authorities as conditions may demand.

Expansion Joints.—An expansion joint shall be laid along the curb and transverse joints ½ in. in width every 50 ft. along the street, these joints to be filled with a bituminous composition, the necessity of the transverse joints to be determined by the local authorities, according to climatic conditions.

Inspection.—The party manufacturing the blocks shall equip his plant with all the necessary gauges, appliances and facilities to enable the inspector to satisfy himself that the requirements of the specifications are fulfilled.

CEMENT, CONCRETE AND CONCRETE PAVEMENTS.

The committee appointed for the purpose of drafting standard specifications for cement, concrete and concrete pavements was made up of the following members: J. H. Weatherford, chairman, city engineer, Memphis, Tenn.; Abram Swan, Jr., city engineer, Trenton, N. J.; Nicholas E. Murray, superintendent of sidewalks, Chicago, Ill.; D. C. Washburn, city engineer, Aberdeen, S. D.; L. A. Jansen, commissioner of public works, Milwaukee, Wis.; C. D. Hill, engineer, Board of Local Improvements, Chicago; Otto H. Klein, chief engineer, commissioner of accounts, New York; Mont. Schuyler, engineer, City Testing Laboratory, St. Louis, Mo.; W. W. Reed, city engineer, Green Bay, Wis.

The committee discussed specifications for cement, concrete sidewalks, concrete curbs and combined curb and gutter, concrete base for pavements and concrete pavements, and reported specifications for each. We have, however, only reprinted the suggested specifications for cement, concrete base and concrete pavements.

CEMENT.

The report of the committee on cement was as follows:

The cement shall meet the requirements of the standard specifications for Portland cement of the American Society for Testing Materials, adopted Aug. 16, 1909, with section 21 of said specifications amended to read as follows:

The minimum requirements for tensile strength for briquettes 1 sq. in. in cross-section shall be as follows, and the cement shall show no retrogression in strength within the periods specified:

Provided, however, if the cement fails to meet the requirements of the 24-hour neat test, it may, at the discretion of the engineer, be held for further tests before being rejected.

One Part Cement, Three Parts Standard Ottawa Sand.

	Lbs.
7 days (1 day in moist air, 6 days in water)	200
28 days (1 day in moist air, 27 days in water)	275

but in no case shall the increase in strength at 28 days be less than 20% over the strength shown at 7 days.

Age. Neat Cement.	Strength, lbs.
24 hours in moist air	175
7 days (1 day in moist air, 6 days in water)	500
28 days (1 day in moist air, 27 days in water)	600

CONCRETE FOR PAVEMENT FOUNDATIONS.

Cement.—The cement shall meet the requirements of the standard specifications for Portland cement of the American Society for Testing Materials, adopted Aug. 16, 1909, with section 21 of said specifications amended as shown above.

Fine Aggregate.—The fine aggregate shall consist of any material of siliceous, granitic or igneous origin, free from mica in excess of 5 per cent, and other impurities, uniformly graded, the particles ranging in size from ¼ in. to that which will pass a No. 100 standard sieve.

Coarse Aggregate.—The coarse aggregate shall be sound gravel, broken stone or slag, having a specific gravity of not less than 2.6. It shall be free from all foreign matter, uniformly graded, and shall range in size from ¼ in. up, the largest particles not to exceed in any dimension one-half the thickness of the concrete in place.

Proportions.—In preparing the concrete, the cement and aggregate shall be measured separately and then mixed in such proportions that the resulting concrete shall contain fine aggregate amounting to one-half of the volume of the coarse aggregate, and that 7 cu. ft. of concrete in place will contain 94 lbs. of cement.

Mixing.—The ingredients of the concrete shall be thoroughly mixed, sufficient water being added to obtain the desired consistency, and the mixing continued until the materials are uniformly distributed, and each particle of fine aggregate is thoroughly coated with cement and each particle of the coarse aggregate is thoroughly coated with mortar.

Where a mechanical concrete mixer is used, the materials must be proportioned dry and then deposited in the mixture all at the same time. The mixer must produce a concrete of uniform consistency and color, with the stones thoroughly mixed with the water, sand and cement.

Consistency.—The materials shall be mixed wet enough to produce a concrete of a consistency that will flush readily under light tamping, but which can be handled without causing a separation of the coarse aggregate from the mortar.

Retempering—that is, remixing with additional water, mortar or concrete that has partially hardened—will not be permitted.

Placing Concrete.—The concrete shall be deposited in a layer on the sub-grade in such quantities that, after being thoroughly rammed in place, it will be of the required thickness and the upper surface shall be true, uniform and parallel with the surface of the finished pavement.

In conveying the concrete from the place of mixing to the place of deposit, the operation must be conducted in such a manner that no mortar will be lost and the concrete must be so handled that the foundation will be of uniform composition throughout, showing no excess nor lack of mortar in any place.

When completed the foundation shall be kept moist for four days, and it shall be protected from traffic until the concrete has thoroughly set before the wearing surface is put on.

CONCRETE PAVEMENT.

Because of lack of experience with this form of pavement, the committee hesitated to recommend unreservedly the adoption of any specifications for concrete pavement. The committee reported that it believed that there are conditions where traffic is light and economy and cost are essential, where a concrete pavement may be used to advantage, and in such cases is recommended the following specifications:

Cement.—The cement shall meet the requirements of the standard specifications for Portland cement of the American Society for Testing Materials adopted Aug. 16, 1909, with section 21 of said specification amended as shown above.

Fine Aggregate.—The fine aggregate shall consist of any material of siliceous, granitic or igneous origin, free from mica in excess of 5 per cent, and other impurities, uniformly graded, the particles ranging in size from ¼ in. down to that which will pass a No. 100 standard sieve.

Coarse Aggregate.—The coarse aggregate shall be sound, broken stone, trap rock or granite having a specific gravity of not less than 2.6. It shall be free from all foreign matter, uniformly graded, and shall range in size from ¼ in. up, the largest particles not to exceed in any dimension one-half the thickness of the concrete in place.

Proportions.—In preparing the concrete the cement and aggregate shall be measured separately, and then mixed in such proportions that the resulting concrete shall contain fine aggregate amounting to one-half of the volume of the coarse aggregate, and that 5 cu. ft. of concrete in place will contain 94 lbs. of cement.

Mixing.—The ingredients of the concrete shall be thoroughly mixed, sufficient water being added to obtain the desired consistency, and the mixing continued until the materials

are uniformly distributed and each particle of the fine aggregate is thoroughly coated with cement and each particle of the coarse aggregate is thoroughly coated with mortar.

Where a mechanical concrete mixer is used, the materials must be proportioned dry and then deposited in the mixer all at the same time. The mixer must produce a concrete of uniform consistency and color, with the stones thoroughly mixed with the water, sand and cement.

Consistency.—The materials shall be mixed wet enough to produce a concrete of a consistency that will flush readily under light tamping, but which can be handled without causing a separation of the coarse aggregate from the mortar.

Retempering.—Retempering—that is, remixing with additional water, mortar or concrete that has partially hardened—will not be permitted.

Placing Concrete.—The concrete shall be deposited in a layer on the sub-grade in such quantities that, after being thoroughly rammed in place, it will be of the required thickness and the upper surface shall be true and uniform.

In conveying the concrete from the place of mixing to the place of deposit, the operation must be conducted in such a manner that no mortar will be lost and the concrete must be so handled that it will be of uniform composition throughout, showing no excess nor lack of mortar in any place.

Finishing.—The pavement shall be finished by thorough hand tamping, until the mortar flushes freely to the surface, then lightly tamped with a templet made of 2-in. plank shaped to conform to the curvature of the surface of the finished pavement, and having a length of not less than one-half the width of the roadway, to give a uniform surface with the slight markings thus made transverse to the street.

Expansion Joints.—Expansion joints shall be placed at right angles to the curb line at intervals of 50 ft. These joints shall be not less than 1 in. wide and shall be filled with creosoted soft wood timber with the grain vertical and extending the full depth of the pavement.

Protection to Work.—During the first four days after placing, the pavement shall be kept moist and it shall be protected against traffic until the concrete has thoroughly set. In no event shall the pavement be used within ten days after being laid.

The Canal Zone Highway.—Two of the three sections necessary to complete the Canal Zone highway from Panama to Gorgona are well under way. The subgrade of the section between Las Cascadas and Gorgona was finished in September, 1909, and crushed rock has since been placed for a distance of about 4,000 ft. out of Gorgona. The rock is quarried in the vicinity and crushed in a portable machine. Between Gorgona and Bas Obispo, the road will be surfaced with rock, but between Bas Obispo and Las Cascadas, gravel, obtained from the deposits at Santa Cruz, will be used. Gravel, which has only recently been used in roadmaking in the Zone, is expected to prove a fairly good substitute, and costs about one-quarter as much a cubic yard as broken stone. Municipal prisoners have been employed on the work of metaling the Las Cascadas-Gorgona extension, which, up to now, has been confined to the Gorgona end. Graveling, however, will be started on the Las Cascadas end within a few days, with contract laborers, and it is expected that the entire section will be about completed by the end of the dry season.

The status of the work on the Canal Zone highway at the present time is shown by the following table:

Section.	Condition.	Length, miles.
Panama to Corozal	Completed	3.30
Corozal to Paraiso	Work temporarily suspended	5.45
Paraiso to Empire	Building	4.82
Empire to Las Cascadas	Completed	2.30
LasC'scadas to Gorgona	Building	4.34
Gatun to Colon	Completed	8.50

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Method of Constructing Concrete Lining for Bergen Hill Tunnels; Pennsylvania R. R. Tunnel Extension to New York City.*

Preliminary Considerations.—For the placing of the concrete lining, a sub-contract was given to Messrs. King, Rice & Ganey, by Mr. Bradley, which provided substantially that all materials should be supplied by him, and delivered to the sub-contractors at track level, at or near the point in the tunnel at which they were to be placed, and that he would supply light and power; the sub-contractors were to supply the plant, forms, and labor necessary for placing the concrete and water-proofing, building the conduit lines, manholes, etc., etc., to complete the lining, the general form of which is shown in Fig. 1. The latter illustration shows the different sections into which the lining was divided for purposes of construction, and the nomenclature adopted for each. It may be noted, incidentally, that the cubic contents of the lining per linear foot of tunnel is almost exactly half the quantity excavated, out to the standard section lines, and as there was some excavation outside of these lines, all of which had to be replaced, the actual quantity of material which had to be brought back into the tunnel was quite a little more than half the quantity taken out. It will be evident, therefore, that the question of transportation was an important one.

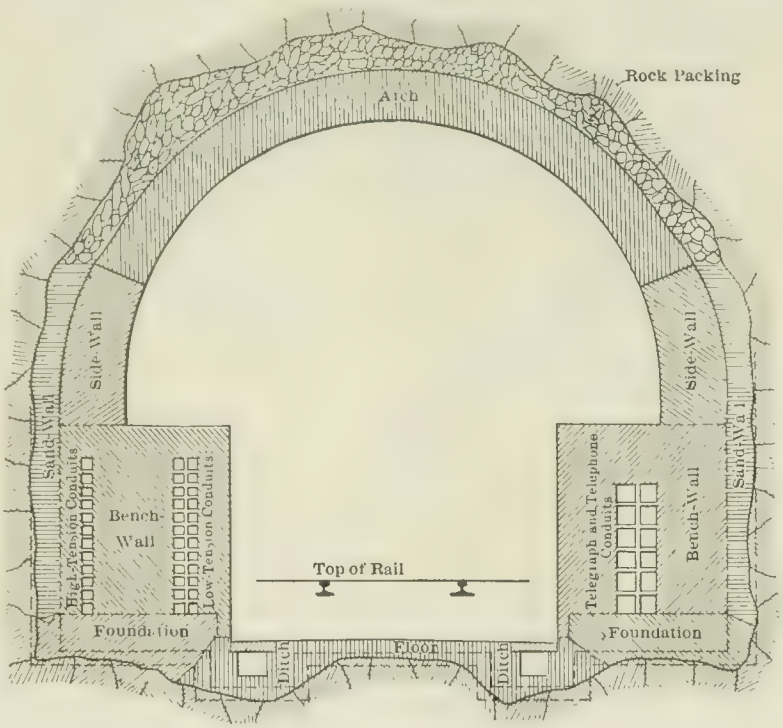

Fig. 1—Sketch Showing Division of Lining for Purposes of Construction and Names of Sections.

An essential part of the agreement with the sub-contractors provided that the operations incident to the placing of the lining should be carried on so as to provide at all times space for a single track of 3-ft. gage, running through the work, and the necessary clearance for the locomotives and cars used in hauling out the muck. A clearance diagram of one of the dinkys used in the tunnels, and its relation to the forms used, is shown by Fig. 00 and also by Fig. 00, the 4-yd. Allison cars, used for handling the muck, taking practically the same width, although they were not quite as high. This requirement and the limited space available must be kept in mind in considering the design finally adopted for the forms and plant required in placing the lining. It should also be kept in mind that, with the rolling stock used, there was only room for a single track through that part of the tunnel where any concrete had been built. As the concrete progressed, therefore, the length of single track was necessarily lengthened, and the problem of transportation was made increasingly difficult.

In working out a design for the bench-wall forms, another highly important and controlling factor, which had to be considered, was the arrangement of the conduit lines, as shown in the general cross-section.

The quantities of the various materials in the lining, per linear foot of tunnel, were as follows:

Concrete		7.64 cu. yd.
Rock packing: Paid for	1.48 cu. yd.	
Outside standard section line	1.74 cu. yd.	
		3.22 cu. yd.
Iron and steel		44.2 lbs.
Vitrified conduits		84.0 duct ft.
Waterproofing		13.0 sq. ft.
Flags		3.3 sq. ft.

General Methods.—The lining was started at both ends of the tunnels before the headings were finally holed through, so that there was practically a separate organization at each end, each in charge of one of the members of the firm. The work at the Weehawken end was started first, and the plant and scheme of working adopted there was thoroughly tried out before the plant for the western end was built, consequently, the latter was somewhat more efficient, being designed in the light of the experience gained at the Weehawken end.

The general sequence of the plan first

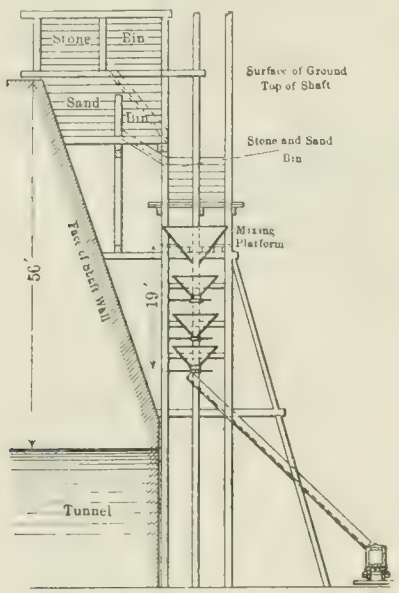
*Condensed from a paper by F. Lavis in Proceedings American Society of Civil Engineers, Vol. XXXI, p. 262.

adopted in placing the concrete is shown by Fig. 1. The concrete was first placed in the foundations up to the elevation of the bottom of the conduit lines, this work, of course, being kept well in advance; next followed, in the order named, the sand-walls, waterproofing, conduits, bench-walls, and finally the arch. The foundation was built in any convenient lengths, multiples of 16 ft., the length of one section of form, the sand-walls in lengths of from 25 to 35 ft., the bench-walls in 25-ft. lengths, and the arch in 10-ft. lengths. Concrete was placed during the day shift only, the forms being moved partly at night, and partly on the alternate days when concrete was not being placed in them.

Five gangs were organized at each end, the first placed concrete in the foundations in both tunnels, as the excavation was ready. In each tunnel there was a gang which built sand-wall one day and bench-wall the next, the two tunnels alternating so that only one bench-wall was built each day, and finally a gang in each tunnel building arches, a 10-ft. section being completed each day. During the night shift, the arch froms and travelers were moved, and all other forms, etc., were by a derrick having a clam-shell bucket, the other two with stone directly from the screen above.

This type of mixer proved very efficient on this work. The largest number of full batches (0.8 cu. yd.) mixed in one plant per hour was about 35; the largest number per day of 10 hrs. was about 240; but the apparatus was never worked to its full capacity, the quantity of concrete which it was possible to use being limited by other considerations.

The concrete for the foundations was hauled in steel, V-shaped, dumping cars holding about 1-cu. yd., and the concrete for the bench-walls and arches in Stuebner, 1-yd., bottom-dumping buckets placed on small flat cars. Rock packing was handled in Allison 4-yd. cars and also in the muck cars as well as in the Stuebner buckets, the latter, however, being most generally used. Mules were used for a short time at the Weehawken end to haul the concrete in, but proved entirely inadequate to haul the loaded cars up the 1.3 per cent. grade, and locomotives were substituted after the headings were holed through. At the western end the cars were allowed to coast in, and, up to the time the headings were holed



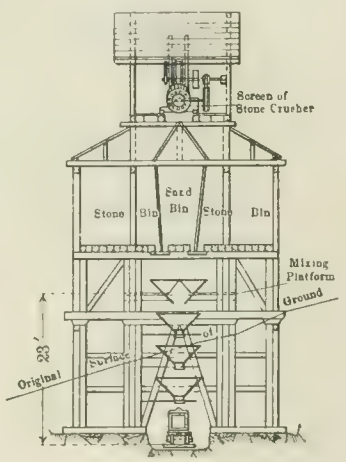


Fig. 2—Diagram Showing Arrangement of Mixers and Material Bins at Hackensack, Portal.

made ready for the concrete to be placed the following day. Some of the conduit laying was done by the night shift, but part of it was necessarily done during the day, as the concrete was built up. A small gang was kept busy in both tunnels, during the day shift, laying conduits and waterproofing. The latter two operations were generally performed by the same gang.

This organization, of course, required considerable regularity in the work, and this was finally attained, but at the beginning many sections were often not finished on time, thus creating considerable confusion. The progress possible with this organization (finally maintained with great regularity) was 75 ft. of bench-wall and 60 ft. of arch per week at each of the two working faces in each tunnel. This allowed the bench-wall to gain considerably on the arch, and therefore at a suitable point, a third pair of arches was started, one in each tunnel, increasing the progress on the arches to 180 ft. per week in each tunnel.

Mixing and Transportation.—All the concrete used on this section was mixed in Hains mixers, one being at each end. At the Weehawken shaft the mixer was installed in the framework supporting the head-house and elevators; and storage bins were arranged above, as shown by Fig. 2, *A*, the whole structure being somewhat strengthened to allow this to be done. At the western end the mixer was placed immediately under the bins of the stone crusher, as shown by Fig. 2, *B*, the track below being connected directly with the tunnels. The stone bin under the screen of the crusher plant at the Hackensack end was divided into three parts, the center being filled with sand through, were hauled back by mules; after that they were pushed out by a locomotive which had gone in ahead of them. As a rule, from 8 to 10 cars of concrete and rock packing were sent in, one after the other, in proper order, a boy riding on each car and stopping it at the proper place; all these cars were pushed out together when empty.

During the time the excavation was being carried on simultaneously with the lining at the Weehawken end, the rock packing was loaded at the working face and sent out to the point where it was to be used; after that the rock packing was sent in from outside from the reserve pile.

At the western end the larger part of the rock packing was sent in from outside, but occasionally, during the time the excavation was going on, the cars from the heading were stopped at convenient points, generally under the gantries, where the lining was being placed, and whatever stone could be utilized was sorted from the top and passed up to the platforms above.

After the headings were holed through, there was considerable difficulty at times in getting a sufficient supply of concrete and rock packing into the tunnel at the time it was required, and while undoubtedly the transportation facilities may have had some influence in this, the principal trouble lay in the difficulty of securing a sufficient supply of proper stone for rock packing, and for the crusher.

While the excavation was progressing, the cars of muck, as they came from the headings, were taken directly to the crusher and dumped into it, the proportion of fine material being fairly constant and the supply regular. At this time, also, a portion of the rock not required at the crusher was dumped along the edge of the bank on the south side of the approach, the larger stones rolling to the bottom where they were easily available to be loaded into cars for rock packing, being entirely free from the fine material; as this stone at the bottom of the bank was used up, the supply was renewed, the rock suitable for rock packing being automatically separated from the fine material as it rolled to the foot of the slope.

After the excavation was completed, however, it was necessary to go into the bulk of the storage piles to get material for the crusher and for rock packing, and then the difficulties were materially increased by the large quantity of fine material encountered, the proportion remaining after the rock packing had been sorted out being too large to send through the crusher. It was not only the handling over of this fine material which caused delay, but the difficulty of disposing of it. On rainy days the trouble was increased by the difficulty of getting men to work in the open.

The delays due to transportation were usually caused by derailments, which were more numerous than they should have been, and were due to the condition of the rolling stock rather than to that of the track. These delays, especially when they occurred in the early part of the day, greatly increased the cost, by necessitating over-time work; a delay of 1 hr. in the forenoon generally meant 2 hrs.' work after 6 o'clock to finish the day's work.

The average number of cars handled (round trips of 1 car) during a day (two 10-hr. shifts) at the Hackensack end during January, 1908, when the excavation and lining were in full swing, was about 125 cars of muck and 200 cars of lining material, the former being hauled by locomotives and the latter by mules.

Methods of Handling Concrete in the Tunnels.—The concrete for the floor, ditches, and foundations, was brought into the tunnel in V-shaped steel, dumping cars, and dumped as near as possible to the place it was to occupy.

The concrete for the arches and bench-walls was loaded at the mixers into 1-yd., Stuebner, bottom-dumping buckets which just held a 4-bag batch. These buckets were placed on small flat cars, hauled into the tunnel, placed beneath the traveling gantry, and hoisted to the platform above.

These traveling gantries, the details of which are shown by Fig. 3, consisted essentially of platforms at each end of which an A-frame was erected; the latter supported at their apexes two I-beams, from the lower flanges of which was suspended a traveling block, shown at *A*, Fig. 3, and through which the hoisting rope was rigged. The buckets were hoisted through an opening in the platform and then moved along to where they could be dumped. The platforms were supported on wheels traveling on rails laid on the concrete of the foundation (for the bench-wall gantries) or on top of the bench-wall (for the arch gantries).

Each of the first two of these traveling gantries used was equipped with a belt conveyor working on a cantilever arm. In using these belt conveyors, the concrete was dumped from the Stuebner bucket into a hopper, with an adjustable slot in the bottom, under which the belt ran.

It was the original intention, in designing the conveyor, that the end of the cantilever arm should be swung from one side of the tunnel to the other, and that the traveler should be moved backward or forward, as might be required, and thus deliver the concrete from the end of the belt directly over the place in which it was to be deposited in the bench-walls. As a matter of fact, it was found impractical in operation to move the gantry readily, owing to its great weight, which was supported on only four ordinary car wheels and their bearings, and it was found more convenient to leave the arm in one position near the center, letting the concrete drop on the platform above the bench- or sand-wall forms, whence it could be shov-

eled into place, than to attempt to move it as had been intended. Both of these difficulties might possibly have been overcome by modifications in the design of the gantry and conveyor, had this method of handling the concrete seemed otherwise desirable.

The principal difficulty with its use, however, was the inability to take care of more than one batch of concrete at a time. When one batch had been dumped into the hopper, a second could not be disposed of until the first had nearly all run through on the belt, and this took from 7 to 20 mins., varying with the consistency of the concrete, etc. In a few instances, where there happened to be some fairly dry batches, the concrete could not be started through the slot at all, and had to be shoveled out of the hopper. On the other hand, it is stated that some batches, under favorable conditions, passed through in about

platform by a rope running to the winch on the hoisting engine on the traveling gantry.

Aside from the fact that neither type was a success, neither of these schemes was much improvement over the belt, inasmuch as only one batch could be handled at a time, owing to the necessity of using the engine to haul the cars back and forth on the platform. The final solution was found in the use of the traveling gantry, shown by Fig. 3. The gantry used for the bench and sand walls was supported on framed bents on wheels running on rails laid on the foundation; that for the arch was the same, except that the high-framed bent was dispensed with, the side-sills resting directly on the journals of wheels traveling on rails on top of the finished bench-wall.

These gantries were used only as a means of hoisting the buckets and moving them along

Mundys, operated by compressed air.

Ditches, Floor and Foundations.—The first method of building the foundation was that shown by Fig. 4, *A*; no attempt was then made to build the ditch, or floor, the intention being to leave these until the completion of the remainder of the lining. In building the bench-wall on this foundation, however, it was found difficult to secure the bottom of the forms properly so as to prevent any give, as the material under the track was not solid enough to brace against. It was decided, therefore, to build the whole of the ditch (see Fig. 4, *B*) so that the bottom of the forms could be braced against the solid concrete. At the beginning of the work, the face of the bench-wall was built up to the level of the bottom of the conduits with the foundation; if, therefore, in placing the concrete above this level, extreme care were not taken to get a

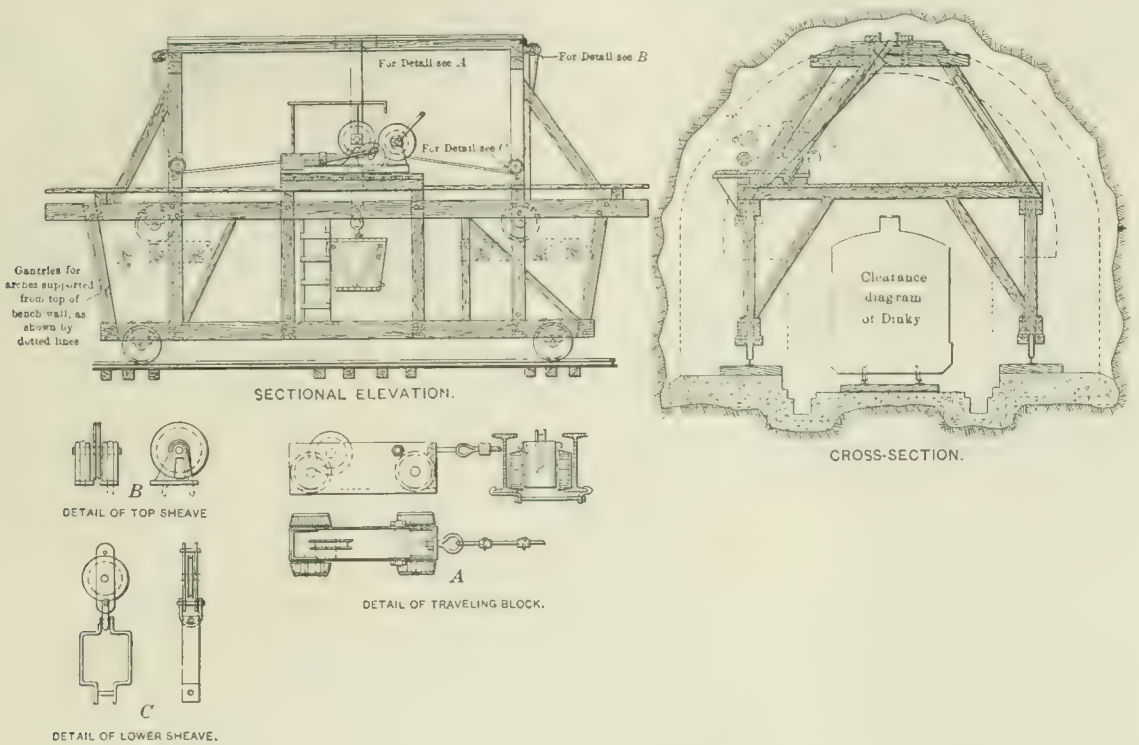

Fig. 3—Details of Traveling Gantry Used in the Construction of the Tunnel Lining.

2 mins., but this was quite exceptional, and the operation was irregular and uncertain.

Before the final method of handling the concrete was adopted, a trial was made of two forms of cars and buckets, to be used on the top platform. In one method the concrete was hoisted in the regular Stuebner buckets, and dumped into the car shown, which was mounted so that it could be revolved in a horizontal plane. It was intended to move this car on the tracks to the point at which the concrete was required, and dump it directly through a chute into the bench-walls. This car was abandoned, as there was a great deal of difficulty in turning it when it was loaded, and in several instances it had to be dumped straight ahead in the middle of the platform and the concrete shoveled into the forms. This method was also objectionable when the bucket was dumped, inasmuch as the force of the impact of a whole batch of concrete dumped from such a height into the forms, not only tended to throw the conduits out of line, and to break them, but also caused considerable strain on the forms.

A different form of bucket was next tried. It had a slanting bottom and a door opening at the side. It was filled at the mixer, came into the tunnel on a small flat car, and was hoisted and placed on a similar car on top. This bucket was not successful, as its great weight made it difficult to handle, and it generally required a man to shovel the concrete out, which latter, of course, had been pretty well compacted in the bottom of the bucket by its trip from the mixer. All these cars were hauled backward and forward on the top

to where they could be dumped directly on the platform, whence the concrete was shoveled into wheelbarrows, which could be dumped directly into the bench-walls; or, in the case of the arches, shoveled from the platform of the gantry to the intermediate platform on the arch ribs, and thence directly into the arch. This use of wheelbarrows, though apparently a somewhat crude method and a retrogression from the use of the belt conveyor, proved very successful, and really involved no more labor than did the conveyors, although this might not have been the case had these latter worked as they were originally designed to.

The method finally adopted allowed as many as four buckets to be dumped on the platform on one end of the arch gantry at one time, and eight on one end of that used for the bench-walls, the workmen handling about three of these latter into the forms by the time the last of the eight was dumped. It required 1½ mins. to place a car under the gantry, hoist the bucket, dump, close it, and return it to the car below.

Rock packing was stored at the other end of the platform, for use as required, when it was not handled directly from the end nearest the work. This method allowed the concrete and other materials to be brought in in trains at infrequent intervals, and provided a sufficient supply of material on hand so that the men handling it on top could be kept steadily at work.

Each hoisting engine on these gantries had 7 by 10-in. cylinders, and a double drum; some of them were Lamberts and some

tight fit between the bench-wall form and the lower face, and then to hold it rigidly in place, the result was a rather unsightly horizontal joint high enough to be plainly visible. Several subsequent sections showed an overhang above this joint, amounting in one or two cases to as much as ½ in., due to the fact that the bench-wall form moved or did not fit tightly. This defect was obviated by building the foundations with an offset on the face, shown by Fig. 4, *B*, so that the joint came at the level of the top of the flagging over the ditches, and therefore was almost entirely concealed; at the same time this allowed a sufficient surface, on the plane of the face of the bench-wall, against which the bench-wall forms could be braced and lined up.

The ditch forms were set very carefully to line and grade by the alignment corps, as this formed the starting point of all the rest of the work, the only other thing which was necessary was to give a level at the front end of the bench-wall form, after it was set, for the elevation of the top of the bench, and to check up the stations of the ends of the sections occasionally to see that they were at the even 25-ft. points (that is +08, +33, +58, and +83).

After a short length had been built with the ditches only, it was thought desirable to try and put in the floor as well, so that the whole of the concrete would be put in place as the lining advanced, and leave less cleaning up to be done over the end of a single track, in the restricted spaces between the bench-walls. Figure 4, *C*, shows the method finally adopted. In this may be seen the three stages

in which it was put in, the details of the ditch forms being shown by Fig. 4, *D*.

In that part of the tunnel where sand walls were built, a hollow tile drain was built into the foundation, as shown in Fig. 4, *A* and *B*, along the foot of the waterproofing and connected at intervals with the drains by 4-in. cast-iron pipes. When the sand-walls and

ment, therefore, for placing the concrete was found to be impractical, if the proposed schedule of a section of bench-wall and a section of sand-wall to be built on alternate days, was to be carried out. In a few instances, where the sand-wall was finished fairly early in the afternoon, the forms were released next morning, and the conveyor was moved back,

lagging was placed in separate pieces and held against the uprights by lightly nailing every third or fourth piece; the whole was removed each time the form was moved, and built up again as the concrete was placed.

Considerable care was taken to slope the top of the sand-wall back toward the rock, as shown by Fig. 5, and to allow free drainage

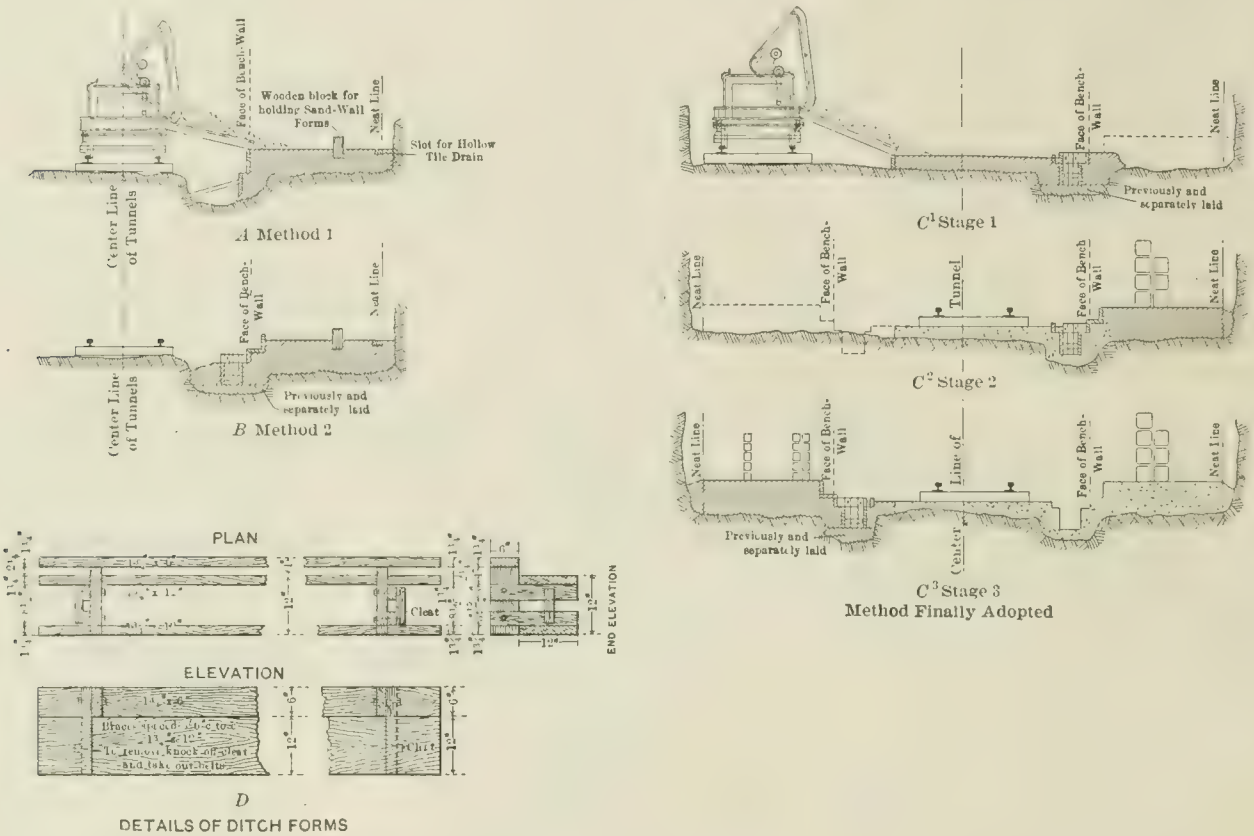

Fig. 4—Plan Showing Various Methods of Building Floor and Foundation and Details of Forms.

waterproofing were not built, however, the concrete of the foundations was sloped from the neat line back to the rock, as shown by Fig. 4, C^3, so that in case any water found its way down through the rock packing, its tendency would be to flow back against the rock, or to follow the low part of this concrete to 4-in. cast-iron pipes leading to the side ditches, rather than to find its way through the joint between the foundation and the bench-wall and so into the lower duct lines.

Sand walls.—As the work was only intended to give a comparatively smooth surface against which to place the waterproofing, no particular care was taken with the surface, except to avoid sharp projections which might cut through the felt and pitch used for this purpose. A rather porous concrete (with all the rock which could be safely embedded in it and have the wall stand) was used, so that it would not act as a dam, but rather tend to allow the water to find its way to the bottom of the tunnel, and so into the drains.

The traveling gantry for placing the concrete in the sand-walls, as first designed, with the belt conveyor, could of course only deliver the concrete at one end. Before setting the forms for a new section, it was necessary, therefore, to move the gantry ahead, before the cross-bracing between the tops of the forms, which also held the top platform, could be placed in position. In order to hold the bottom of these forms, small wooden blocks were embedded in the foundation concrete, against which they could be wedged, as shown by Fig. 4 *A*; these blocks were cut out after the sand-wall had been built.

After the forms had been filled, the conveyor could not be moved back to the bench-wall until the concrete had set sufficiently so that these cross-braces could be removed, and, on account of the overhang at the top, the set had to be fairly good in order to prevent this overhang from breaking off. This arrange-

but, even then, 2 or 3 hours at least were lost at the beginning of the shift. The conveyor, however, was abandoned, for the reasons previously given, and the traveling gantry was rearranged to allow concrete to be delivered at either end; it was then only necessary to move it backward and forward between the bench- and sand-wall forms instead of through these forms. This permitted the con-

along the top (which ran parallel to the grade of the tunnel) to the 4-in, cast-iron drain pipes which carried the water from the rock packing above the arch to the drains beneath the track.

Sand-walls were built for a length of about 1,100 ft. in each tunnel at the Weehawken end, and about 700 ft. in each tunnel at the western end, the remainder of the work, with the

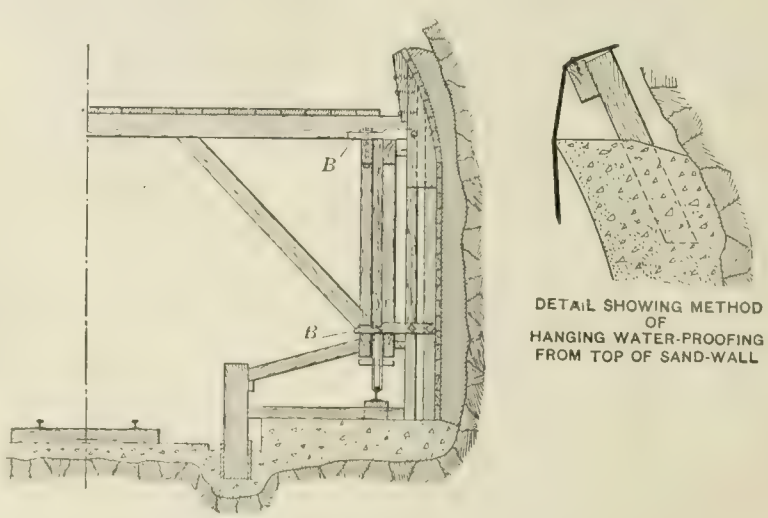

Fig. 5—Traveling Form for Building Sand Wall.

struction of the much more substantial type of forms shown by Fig. 5.

After being moved ahead on the track on top of the foundation, the form was first blocked up to grade, and then adjusted to line by the screws and slotted cleats shown at *B*, Fig. 5, after which it was secured by the braces from the ditches, as shown. The face

exception of a few short stretches, not being considered wet enough to require waterproofing.

Conduits.—On the core-wall side there are 48 lines for telegraph and telephone cables, built of 4-way multiple conduit, each piece of which is 3 ft. long and about 10 in. square outside. On the other side there are the high-

and low-tension lines, built of single conduit 18 ins. long and a little more than 5 ins. square outside. Man-holes or splicing chambers are built over every 400 ft., and are about 8 ft. long and 4 ft. wide.

In attempting to plan the work of placing the lining, two methods of building the bench-wall were considered. One was to build the wall in longitudinal sections, each section separated by a line of ducts; and the other was to attempt to build the wall in the manner called for by the specifications, which required the concrete to be carried up in layers as the conduits were laid. In this latter method, it was proposed to bond the concrete together with the forked bonds, the details of which are shown by Fig. 6, *A*, but, as it might have been impractical to use these if the wall had been built in sections, provision was made in the contract to place expanded metal, as shown by Fig. 6, *B*, if this was thought advisable. The method of construction necessary, if the wall had been built in sections, is shown graphically by the five sketches, Fig. 6, *B*, 1 2, 3, 4, and 5.

The form and details of the expanding mandrel which was finally designed to meet the conditions, and proved so satisfactory in that the wraps could be placed around the joints. The 4-way conduits were generally laid in the ordinary way, except that no laying mandrel was necessary. One dowel was used between each of the pieces of conduit, at the center, and the joints were wrapped. When a line was finished, two mandrels were placed diagonally in each line and expanded simultaneously, so that any inequalities in the ducts themselves were divided as far as possible. In connection with the use of these mandrels, one of the points which was most carefully watched was that they projected back into the last completed section, thus insuring the continuity of the alinement.

It was originally intended to wrap the joints of the 4-way ducts only, but it was found to be impractical to keep the grout from the wet concrete entirely out of the single ducts, and, after a short trial, it was decided to wrap these also. The expanding mandrel kept out a great deal of the cement, and in the sections laid without wraps, the only difficulty from this cause seemed to be that a slight film of grout, from 1-16 to ⅛ in. thick, was deposited on the bottom of the inside of the ducts at some places, and although this was not considered a serious defect, it was furnished by the Great Eastern Clay Co., and were made at its factory at South River, N. J., where they were inspected before shipment.

The mandrel used in the final rodding was made as shown at *G*, Fig. 6, the larger size being used for all lines. The rods for pushing it through the conduit lines were made of 6½-ft. lengths of ordinary 1-in. wrought-iron pipe with extra long (3-in.) couplings. The lines were rodded in both directions from alternate manholes, thus avoiding uncoupling the rods and allowing every pull to be effective in pushing the mandrel through the ducts.

Wooden rods were used at first, but proved entirely too light, as the mandrels used were a close fit, and it required considerable effort to push them through 400 ft. of conduit. Iron pipe with ordinary couplings was next tried, but the couplings broke quite often as the threads became worn in uncoupling the sections to move the rods from one line to another, and the break was generally inside a duct line. The long couplings were finally adopted, and a set of rods was put in each line, that is, six sets in all, so that when coupled up they remained in the line until it was finished. The expense of the extra

every way, are shown by Fig. 6, *C*. The mandrel consisted of two triangular pieces of hard pine, separated by wedges attached to one piece which fitted into slots in the other; these, when expanded, practically filled the whole of the inside of the ducts. One of these mandrels was placed in each line of single ducts and two in each 4-way duct, placed diagonally. This required 60 mandrels at each working point, or 240 for the whole work. The mandrels were 35 ft. long, so that they easily covered the whole of a 25-ft. section, projected sufficiently far back into the previously finished work to assure the continuity of the alinement, and allowed the ends to be racked out at the forward end to secure proper breaks between the joints.

In laying the single conduits, as a rule, the (collapsed) mandrels were pulled ahead from the previous section as each line was laid, and the conduits were strung on it until the whole length was completed; the conduits were then pushed up tight together, so as to close the joints as tightly as possible, and then the mandrel was expanded. The conduits were thus held firmly in position, and the forward end of the line was lifted slightly so thought that the slight extra cost of placing the wraps would undoubtedly be justified by the practically perfect results obtained by using them.

Considerable attention was given to breaking the joints of the ducts properly, so as to maintain throughout the conduit lines the greatest breaks possible. The joints in each superimposed line were broken at half the length of the individual pieces of conduit, the joints in lines in the same horizontal plane being broken at one-quarter the length, thus preventing any joints from touching one another at the sides or corners, which tended to prevent a burn-out on one line from being communicated to another. There was some little difficulty at first in maintaining the breaks, owing to slight variations in the lengths of the conduit, but after a very short time both the workmen and the inspectors became very expert at this and in the proper use of short lengths to maintain the spacing; after the first few weeks there was little difficulty in attaining at all times almost perfect results. The method of making the breaks is by the isometric sketch at *F*, Fig. 6.

All the conduits used on this work were quantity of pipe thus required was more than offset by the decreased labor cost.

It was thought necessary at first to run a cutter, Fig. 6, *E*, through the conduits ahead of the final rodding mandrel, but this was soon found to be unnecessary except in a very few instances, and, after a short experience, the cutter was only used at places where an obstruction was encountered by the mandrel.

At such times as the pipe became uncoupled inside the duct line, the part remaining inside was recovered by the use of the tool shown at *D*, Fig. 6, called a "weasel." In two instances, the mandrel became stuck in such a manner that the duct line had to be cut into in order to take it out.

The best day's work of the rodding gang (1 foreman and 4 men) was 20,400 duct ft. of the 4-way conduit in the telegraph and telephone line, and 19,200 duct ft. of single conduit on the low-tension line, an average day's work under ordinary conditions being about 10,000 duct ft. The cost, including labor, material, and all tools, for rodding for the whole work was slightly less than 0.2 ct. per duct ft. The average cost of the single conduit was about 0.25 cts. per ft., and of the 4-way,

0.15 cts. per ft. About 10 per cent of the conduit lines were rodded twice, owing to partial sections having been rodded once before completion. The best continuous work on rodding was done between October 22d and 29th, 1908, when in 7 working days, 105,600 duct ft. were rodded, an average of a little more than 15,000 ft. per day.

Bench-walls.—The original design for the tunnels provided for the construction of a brick arch above a point 22 deg. above the springing line, that is, the part above the side walls (Fig. 1.). It was thought desirable, therefore, in designing the bench-wall forms, to provide for placing the concrete in the side-walls and bench-walls at one operation. These forms, as first designed, are shown by Fig. 7, *A* and *A'*; they were built of steel, the facing plates being 5-16 in. thick, in pieces 4 ft. 6 ins. wide, and in length about 6 ins. more than the height of bench-wall.

The design was controlled very largely by the necessity of providing the requisite clearance for the locomotives and muck cars, and the principal feature was the support of the forms on two trusses, one at either side, the front ends of which were supported from the foundation on a long leg, and the rear ends directly on the journal-boxes of wheels traveling on a rail on the top of the finished bench.

Although it had been decided to substitute concrete for brick in the arch before any of the lining was actually placed, two sets of forms for the Weehawken end had already been ordered and delivered, so it was decided to use them as designed, and place the side-wall with the bench.

The forms were designed so that 30-ft. lengths could be built, and this was done at the start, but owing to the occurrence of the refuge niches, ladders, etc., at 25-ft. intervals, it was soon seen that it would be advisable to build the bench wall in sections of that length (25 ft.), or multiples of it, and as the clearance conditions seemed to preclude the possibility of making the forms 50 ft. long, 25 ft. was adopted. This permitted the removal of one of the panels, 4 ft. 6 ins. wide, and at the same time it was decided to remove the side wall forms. This decreased the load on the trusses considerably, but being still a trifle weak, they were strengthened by the substitution of 1¼-in. truss rods instead of the ¾-in. rods used originally. The top platform and the cross bracing were also stiffened a little and tightened up to prevent racking.

The construction of the side walls in conjunction with the bench wall was abandoned for three reasons: First, it was found that there would be a much more even distribution of the work by including the side wall with the arch rather than with the bench; second, there was difficulty in getting a good finish for the top of the bench wall, as of course a top form for the latter had to be placed to prevent the concrete from squeezing up when the side wall was built above it, which prevented troweling; the third reason was the weakness of the whole form as designed, and the increasing difficulty of adjusting it to line as the work progressed, the principal difficulty being with the curved side-wall forms.

The bench wall forms were set in position, after they had been moved ahead, by first blocking the bottom against the face of the foundation, as shown by Fig. 4. As previously noted, this foundation face had been built very carefully to line. The back end of the form, of course, was blocked tightly against the end of the previously finished section, and the top was made plumb by the adjusting screwjacks shown in Fig. 7, *B*. At first these screws were ¾-in., but they were afterward changed to 1¼-in. The only points which it was necessary for the alinement corps to give in setting these forms was a grade at each of the front ends for the top of the finished bench.

Fig. 8—Sketch Showing Method of Making Arch Closure.

The steel face forms in both tunnels gave excellent results, as far as smoothness of finish was concerned, but, owing to the imperviousness of the steel, small air holes were

formed in the surface, though not in sufficient numbers or size to cause trouble or disfigure the work in any way.

The design of the bench wall forms used at the western end, where this differs from the steel form, is shown by Fig. 7, *D*. The principal features in which they differed from those used at the Weehawken end was in the substitution of 2½-in. tongued and grooved hard pine for the face. This timber was of the very best quality obtainable, each piece being especially selected and as nearly clear and free from knots or other defects as it was possible to get it. The edges of each piece were planed at the back so as to insure a tight joint on the face, and all joints were shellacked. These forms were used without renewal of the face timber and with only two planings, for a length of 2,500 ft., or 100 separate sections, and gave good satisfaction.

In order to obtain a surface to which the face lagging could be fastened, wooden uprights were used and were reinforced on either side by light channels bolted together through the timber, in place of the I-beams used on the steel forms. The lagging was nailed to these uprights by 6-in. wire nails driven through the top edges of each piece as it was placed in position, thus leaving the surface entirely clear and free from any marks or nail holes, and in condition for planing when this became necessary. Runways for wheeling the concrete were built on either side over the bench walls instead of having a center platform with chutes, as was used at Weehawken.

When the original lagging had become too much worn for further use, it was resurfaced with strips of ⅞ x 2½-in., clear, tongued and grooved, hard pine, placed vertically, which did fairly well and lasted to the end (about 1,000 ft.), although it was not altogether satisfactory, and the last eight or ten sections built had to be rubbed down with a wooden float in order to obtain a suitable finish.

In designing the forms for all exposed surfaces in the tunnels, it was the desire of the contractors to obtain directly from them a surface which would be satisfactory to the engineers without further finishing than the patching of minor defects. In this they were generally quite successful, and excellent results were obtained. The surface of the bench walls was obtained solely by spading the face with a flat spade as the work progressed. No after treatment was resorted to, except for the few sections where the forms became worn. The top of the bench wall was finished with a float about 2 or 3 hrs. after the concrete was placed.

When the work was well organized, a bench wall was built at each end each day, one day in the North Tunnel, and the following day in the South. During the time sand walls were being built, a sand wall and bench wall were built on alternate days in each tunnel, care being taken that when a bench wall was being built in one tunnel, the sand wall was being built in the other, this being necessary in order to equalize the work of the night gang and the conduit layers as well as the transportation.

The conduit layers on the day shift, two or three men and a foreman, required about 2 hrs. in the forenoon and 1 hr. in the afternoon to lay their portion of the conduits, and usually finished this work by 3 p. m. At other times during the shift they were utilized at those points where rock packing was heaviest, and when the packing was brought in in the large cars, these men helped unload it so that the track could be cleared as soon as possible.

When waterproofing was to be done, the number of men in this gang was increased, so as to enable them to do that work also.

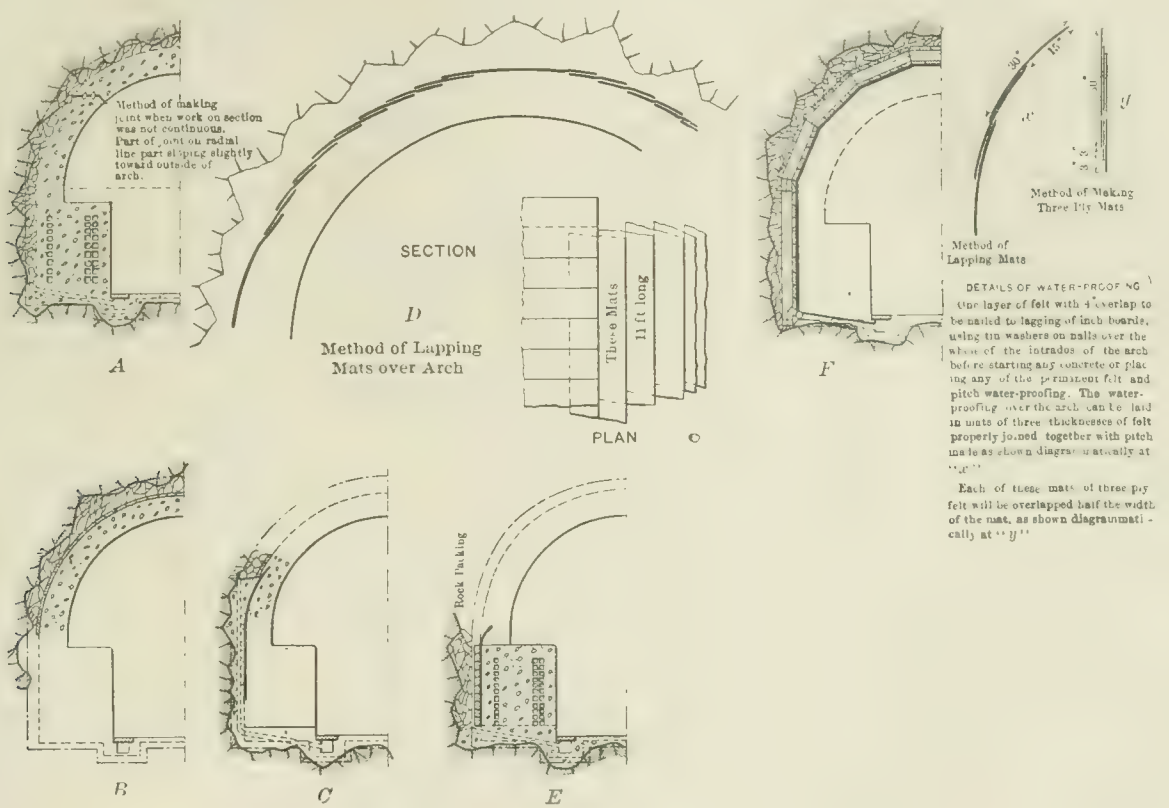
A gang of four rough carpenters and a foreman was employed on the day shift; they moved and set the bench wall forms or sand wall forms, as the case might be, and moved the traveling gantry into position. This was done in the afternoon, and required about 3 hrs. They also took out, cleaned, repaired, and set all ditch forms, all passenger forms, circuit breaker forms, and did all other repair work. The ladder forms, the refuge-niche forms, and overhead conductor pocket forms were attended to by one man, who set, removed, cleaned, and repaired them. The carpenters on the night shift set the arch centers and gantries, also the manhole forms when needed. The conduit layers on the night shift laid up half the 4-way conduits (3-high) and one-third of the single ducts (4-high). This one gang laid the conduits in two sections of bench wall each night, that is, one section at Weehawken and the other at the western end.

In concreting the bench walls, the concrete was first placed on the side containing the single conduit until it reached the top of the four tiers laid, then the concrete gang was turned over to the side with the 4-way conduits while four more tires of single conduits were laid, the work thus progressing, the conduits being laid on one side while concrete was placed on the other. On the side of the 4-way conduits the concrete was built in two layers while that on the side of the single ducts was built in three; the interval between the different layers was not sufficiently long to prevent a complete bond being obtained, and there were only one or two instances where there was any mark on the face to indicate a break.

After the work had been in progress some time, it was found to be quite feasible to build all the 4-way conduits at night and half the single conduits, that is, 6 ducts high, as the mandrels proved amply sufficient to hold them in place; in fact, had it been necessary, the writer has no doubt that all the ducts might have been laid and held in place with very little extra precaution, by the use of the expanding mandrels, as described under the head of conduit laying. A V-shaped joint about ½ in. deep was made between each section of bench wall so that the expansion cracks would follow this joint rather than show irregularly on the face. These joints divided the face into the even 25-ft. panels, and were very effectual in concealing what few cracks there were.

After the construction of the sand walls was discontinued, the space behind the bench walls, between the neat line and the rock, was filled with rock packing, which was generally built, part way up at least, as a dry wall ahead of the construction of the bench wall, or it was put in place simultaneously with the concrete, care being taken to keep it as free as possible for the drainage of any water there might be. Toward the latter part of the work, owing to the difficulty of getting sufficient rock packing during the day, a rough back form for the bench wall was built at the neat line, in places where the section was at all large, and the space was filled with rock afterward, generally at night or on Sundays.

In the sections where waterproofing was required, where no sand wall was built, the rock was taken out for 2 ft. outside the neat line, if the excavation was not already that far out (at the expense of the contractors, who preferred to do this rather than build the sand walls for the short sections required), so that there would be sufficient room for placing the waterproofing on the back of the bench walls, as shown by Fig. 9, *E*. The waterproofing of these sections was left until just before the



Method of making joint when work on section was not continuous. Part of joint on radial line part sloping slightly toward outside of arch.

Fig. 9—Various Types of Arches and Water Proofing Used.

arch was to be built, and after being placed it was protected by a single row of brick laid on edge before the rock packing was filled in.

Arches.—In Weehawken section of the tunnel, the lower part of the arch, about 5 ft. above the bench wall, was built first, as previously referred to, but the centers, as will be seen, were built so that they could be used for the whole of the arch.

The front bulkheads used were made in nine sections, bolted to a 2½ x 2½-in. angle bent to the radius of the arch, and fitting on the end of the lagging; when set they were braced partly against the rock of the roof and partly against the gantry. After the ribs and part of the lagging had been set by the night gang for a fresh section of arch, the braces holding the bulkheads were knocked out, the concrete placed during the day having set sufficiently by this time; the whole of the bulkhead was then easily moved ahead, sliding along the lagging to the forward end, and made ready for the next day's work. The middle section at the top was taken out temporarily, to faciliate working at the sides, until it was needed.

The arches were built in 10-ft. sections, the ribs being spaced 5 ft. apart, the end ribs of each section supporting the end of the lagging on two adjoining sections. Five sets of lagging and ten ribs were used at each place where the arch was being built, thus giving each section practically 4 days' set before removing the centers. Probably in the greater part of the work the centers could have been removed in from 40 to 48 hrs. after the concrete had been placed, but 3 days was considered the least time which would certainly be safe at all times, and the contractors thought that the very slight additional expense involved in leaving the centers up 4 days was more than warranted by the additional feeling of security.

The lagging was made from 3 to 6-ins. clear, hard pine, 10 ft. long, dressed to about 2½ ins. in thickness, about 5½ ins. in width, and the sides to radial lines. As it was placed, every third or fourth piece was lightly nailed to the ribs; when the latter were released and taken down, the nails pulled out, and the lagging was left in place until one piece was pried out, allowing the others to fall. A light A-frame, about 8 ft. long, spanning the bench walls, was placed below, in order to break the fall and allow the lagging to slide to the top of the bench walls rather than to the track beneath.

Cross passages between the two tunnels were built every 300 ft. There were two circuit breaker chambers, one at Station 286 and the other at Station 310. Steel doors are provided so that all the openings between the two tunnels can be closed. At Station 294+24, the core wall broke through for a length of about 40 ft., and instead of filling this in, a storage chamber 34 ft. long and 11 ft. wide, inside, was built there.

During construction the arches in each tunnel were kept even with each other, so that when the cross passages were reached, they, and the section of arch which they joined, could be completed at one operation.

By the methods used on this work, one section of arch was easily built in a shift, so that the monolithic construction of each section was easily secured, and concrete, as wet as it was possible to handle with shovels, could be used for all except the last 5 ft. or so at the top, thus getting a structure which was as nearly impervious as possible under the circumstances.

The gangs placing the arches were paid overtime when they were required to work after 6 o'clock to finsh their section, which was generally only necessary when the quantity of rock packing to be placed was very large. If they finished their section before 6 o'clock, however, they were allowed to quit when this was done, and were given a full day's pay. The difference in time, when there was any, was usually due to the greater or less quantity of rock packing, as the excavation varied from the standard section line.

In building the arches, the night gang set the two ribs (one at the center and one at the forward end of the section to be built), placed the lagging on the sides, 4 or 5 ft. high, built the shoveling platform on the horizontal cross braces of the ribs, and placed the traveling gantry in position for use. The forward end of the gantry (that is, the end farthest from the arch being built), was loaded with rock packing to be used as required. As the concrete was brought into the tunnel it was hoisted and dumped on the end of the gantry next the arch, and shoveled from there to the platform on the ribs and from there into place. The rock packing brought in during the day was dumped on the front or back end of the gantry, as was most convenient, and handled into the work in the intervals between batches of concrete. The concrete and rock packing, with the backlagging and waterproofing, where these were used, were placed simultaneously, or nearly so, and brought up the sides together until the key was reached; the latter was then worked from the back toward the front. The key was usually made about 5 ft. wide, the lagging for this width was made 5 ft. long and put up in two sections. It was found to be more convenient to have the key of this width than narrower.

The method used in making the closures where two sections of the arch came together is shown by Fig. 8.

Waterproofing.—The original design for the lining of these tunnels provided for a brick arch. It was intended to cover this arch with waterproofing, this latter extending over the whole of the roof and down the sides as far as the bottom of the conduit lines. The waterproofing was to be placed against the sand walls on the sides, up to the top of the side walls, Figs. 1 and 5. Over the arch, after being placed, it was to be protected by an armor course of brick, laid flat, the space between the brick and the excavation, which was required to be not less than 4 in. (and, as a matter of fact, was actually a great deal more), being filled with rock packing. Besides filling the space, this latter was designed to allow any water from the roof of the tunnel to find its way easily to the top of the sand wall, from there being carried through the 4-in. castiron pipes, to the side ditches in the floor of the tunnel.

All the waterproofing placed in these tunnels was of felt and pitch, sixply felt and seven layers of pitch. The felt was required to be Hydrex, or of equal quality, and the pitch, "Straight run coal-tar pitch which will soften at 60 deg. F., of a grade in which the distillate oils will have a specific gravity of 1.05."

In addition to tests as to the above qualities, the pitch was analyzed to determine the amount of free carbon it contained, and was not accepted if this fell below 20 per cent.

It was considered quite important that there should be absolutely free drainage on the outer side of the lining, so that there would be no chance for any water to acquire a head. More than three-quarters of the length of these tunnels is below the level of mean high water, and while it was hardly expected that there would be any direct connection between the water in the Hudson River and the ground-water of the section penetrated, it was thought wise to provide ample drainage.

Before the lining was started, however, the excavation had progressed sufficiently to show that the tunnels, while very wet in places, and varying from that to quite damp, would be, on the whole, much dryer than had been anticipated. It was then decided to substitute concrete for the brick in the arch and omit the waterproofing over the top, except at places where water came into the tunnels in sufficiently large quantities to form practically a continuous stream. Three general types of construction for the arch were decided on, as shown in Fig. 9. The first, as shown at *A*, was to be used where the tunnel was quite dry. In this type, the sand wall was omitted entirely, and the concrete and rock packing were built up together, the rock packing impinging to a certain extent on the concrete, and the concrete squeezing somewhat into the rock packing. The section shown at *B* was used where the tunnels were damp, or where there were slight droppers not forming a continuous stream. The back lagging, of 1-in. boards, which was left in place, provided a practically smooth outer surface on the concrete arch, and allowing the concrete and rock packing to be built almost simultaneously. It was considered that the free drainage through the rock packing, the surface of the boards, and the smooth outer surface of the concrete in the arch would allow the comparatively small quantity of water in these parts of the tunnel to find its way to the sides, and thence to the ditches at the bottom, rather than to percolate through the concrete, and this proved to be very generally the case, as is shown by the dry condition of the tunnel as built. The back lagging was used over the arch both, where the sand wall was built and where it was omitted, as well as being placed over the waterproofing of the arch as an armor course where waterproofing was required. Where the sand walls were built and waterproofed, and where the waterproofing was not carried over the arch, the waterproofing was turned in at the top, as shown at *C*, Fig. 9.

The third method provided for water-proofing the whole of the arch, and was the same as *B* except for the addition of the waterproofing inside the back lagging. In placing this water-proofing, the felt was cut in strips about 11 ft. long (about 1 ft longer than the length of a section of arch), and six thicknesses were cemented together with hot pitch. These mats were then laid shingle-fashion, as shown at *D*, Fig. 9, up the sides of the arch until a space about 5 ft. wide remained at the crown; shorter mats were then brought out over this, laying them perpendicular to the axis of the tunnel. Care was taken in making all laps, irrespective of the direction in which the arch was built, so that they would lay with the grade, that is, so that the water would tend to flow over the edges of the laps rather than against them.

Most of the wet sections of the tunnel were at the ends, where sand-walls had been built for the purpose of providing a smooth surface against which the water-proofing was to be placed; there were several wet places at isolated points in the tunnels, however, and, in order to avoid building sand-walls at these points, the method shown at *E*, Fig. 9, was adopted. This involved a slightly larger excavation, 2 ft., outside of the neat line up to the height of the top of the bench, where there was not already that much room. The bench-wall was built with a back form on the neat line, the waterproofing was placed as shown, protected by an armor course of brick, and then continued over the arch when this latter was built. The excavation and refilling with rock packing were done at the contractor's expense, which he was willing to assume rather than build these short sections of sand-wall.

The method of waterproofing that part of the timbered section which was very wet, is shown at *F*. Fig. 9. A lagging of 1-in. boards was nailed up the sides and to the soffit of the segmental timbering, all the spaces outside of this lagging being carefully filled with rock packing. Before starting any concrete work, a single thickness of waterproofing felt was nailed to the inner side of the lagging, which not only served to protect the finished surfaces of the concrete from the water which fell copiously from the roof, but also provided a comparatively dry surface to which the regular six-ply waterproofing could be cemented with pitch and held in position, while the concrete was placed against it.

In placing the water-proofing in this section on the sides, the strips of felt were placed vertically, nailed at the top to the wall-plate, to support their weight, and lapped and cemented with pitch to the sides as on the sand-walls, except that there was no trouble from the overhang. After the bench-wall had been built, the felt was cut just below the nails and about 2 ft. above the top of the bench, so that the mats which were placed over the arch could be inserted behind it. The roof was covered with three-ply mats and lapped over a little more than half, as shown diagrammatically on the drawing.

When the upper part of the arch was reached, where the cementing strength of the pitch was not sufficient to hold the felt in place, the mats were braced temporarily from the center-

ing, until the concrete could be packed against it.

Where the water-proofing was placed against the sand-wall, the method of securing the sheets at the top is shown in the small sketch on Fig 15. At the start an attempt was made to stick the water-proofing to the sand-wall, but this could not be done on account of its dampness and the overhang at the top.

The sand-wall water-proofing was kept about 35 ft. ahead of the finished bench-wall. As the bench-wall form was moved ahead and set, the mat was braced back against the sand-wall from the forms at a point just above the top of the finished bench, care being taken to avoid wrinkles, as, if these were once formed, it was practically impossible to straighten them out.

The completion of the bench-wall left the upper part of this water-proofing stretched taut across the curved top of the sand wall, forming a chord of the arc. As the arch was built up, the top was gradually slackened so as to allow the concrete to press the mat back into place until the top of the sand wall was reached, when the end was turned in, as shown at *C*, Fig. 9, or the waterproofing was continued over the arch, if that was necessary.

The desire to obtain a dry tunnel, and the methods adopted to secure it, were responsible in a great measure for the decision to build the arch in short lengths, as well as the reasons given under the head of arches. Had the tunnels been dry throughout, the method shown at *A*, Fig. 9, could have been used exclusively, and, except for the fact that monolithic concrete might not have been obtained, there would have been no objection to building longer lengths.

The quantity of water reaching the tunnel drains and flowing out of their lower ends after the completion of the lining was about 100,000 gals. per day, or 75 gals. per min.; of this it is estimated that considerably less thaan 1 per cent comes through the lining in the form of leaks. The very general distribution of this water over the roof is indicated by the fact that, during the excavation of the first 1,000 ft. of both tunnels from the Weehawken end, oilskins had to be provided for the laborers to induce them to work at all. The success, therefore, of the rock packing as a means of diverting this water to the side drains, is shown, especially in view of the fact that, excluding the cut-and-cover section, only 10 per cent of the length of the arch, 1,189 ft., was waterproofed.

Considerable care was taken to make all joints in the concrete which were in such a position that water might follow through them to the inside of the tunnel lining, in such a manner that they would slope outward toward the rock. The top of the sand wall is shown by Figs. 5 and 9. The slope of the back of the foundation may be noted in Fig. 9, and the method of making the joint in the arch, in the few instances where a section was not completed at one operation, is shown at *A*, Fig. 9. These joints in the arch were not allowed to be made above a point 60 degrees above the springing line.

Table I shows approximately the number of men employed daily on the tunnel lining, by both the contractor and the sub-contractors, their occupation, the average rate of wages and the total daily expense for labor when the work was in full swing.

Some Notes on Cost of Treating Ties with Preservatives.*

Comparative Cost of Treating Seasoned and Unseasoned Ties.—With some process, air seasoned ties only can be treated, while with others either seasoned or unseasoned ties may be treated, the latter being artificially seasoned in the retorts by steaming. The question is often asked whether it is more economical first to season the ties in the yard, or artificially to season them in the retorts, and thereby treat them immediately as delivered to the plant.

This is a somewhat difficult question to answer, as there are so many factors to be taken into consideration, and what will apply to one locality may not necessarily apply to another. First, we would have to decide what is a seasoned tie. In the South a pine tie may be seasoned thoroughly in two months. In the Northern states it may require three to six months, and even longer. For an illustration, let us take a plant situated in one of the northern states, say Illinois, for I am better acquainted with that climate. We will assume that we have a plant with a capacity of treating 1,800,000 season ties annually, and that it will require an average of six months to air season the ties for treatment, necessitating the storing of 900,000 ties continually. Of course, ties will season more rapidly in warm weather than in cold weather, and some kinds of wood more rapidly than others, but the average may not be far from six months. We must further assume that we are using a process which can be adapted to either seasoned or unseasoned timber. We will also say that thoroughly seasoned ties can be treated in six hours, and that unseasoned ties will require nine hours, or in other words it will require one-half longer time to treat unseasoned timber. Of course this will vary one way or the other but this is no doubt a fair average.

*Extracts from a paper by F. J. Angier, Superintendent of Tie Preservation, Chicago, Burlington & Quincy R. R., read at the February meeting of the New York Railroad Club.

Seasoned Ties.

Capacity of Plant, 1,800,000 Per Year.

Unloading from cars to ground to season at 0.0070 each	$ 12,600.00
Loading from ground to trams after seasoning at 0.0055 each	9,900.00
Switching trams from yard to retorts at 0.0020 per tie	3,600.00
Loading treated ties out at 0.0065 each	11,700.00
Fixed expenses	28,800.00
Preservatives at 0.150 per tie	270,000.00
Fuel (assume ⅓ less for seasoned over unseasoned ties)	6,000.00
Insurance on 900,000 ties (estimated)	3,000.00
Interest on 900,000 ties, or say 5 per cent on $450,000	22,500.00
	$368,100.00
600,000 more seasoned ties treated than unseasoned, worth 0.0451 each. (See part 12)	27,060.00
Total	$341,040.00

This gives a cost of $0.1895 per tie.

Unseasoned Ties.

Capacity of Plant, 1,200,000 Per Year.

Unloading one-sixth from cars to ground to enable prompt releasing of cars, and to insure a continuous supply so as not to delay plant at 0.0070 each	$ 1,400.00
Loading 1,000,000 ties from cars to trams for treatment, and 200,000 ties from ground to trams at 0.0055 each	6,600.00
Switching 200,000 ties from yard to retorts at 0.0020	400.00
Loading treated ties out at 0.0065	7,800.00
Fixed expenses	28,800.00
Preservatives at 0.150 per tie	180,000.00
Fuel (estimated)	9,000.00
Insurance on 200,000 ties (estimated)	665.00
Interest on 200,000 ties, or say 5 per cent on $100,000.00	5,000.00
Total	$239,665.00

This gives a cost of $0.1997 per tie.

From the above statement results show that to treat thoroughly seasoned ties, the cost is $0.1895 per tie; whereas, the unseasoned ties cost $0.1997 each, or a difference of $0.0102 in favor of seasoning. This multiplied by 1,800,000, the capacity of the plant, represents a saving of $18,360 per year.

In addition to this saving there would no doubt be other advantages, such as a better penetration by the preservatives, thereby getting a greater life out of the ties, and reducing the liability of weakening the timber from excessive steaming. Another important factor is that in steaming there is always a large amount of sewage to dispose of, while in non-steaming there is practically none. The disposition of sewage is always a difficult problem at any plant, because no matter how you handle it, it will eventually get into the rivers or creeks and pollute the water supply to such an extent that damage suits may result sooner or later.

Cost of Treatment and Returns on Investment.—A plant consisting of three treating cylinders, each 6 ft. in diameter and 132 ft. long, will have a capacity of about 1,500,000 ties annually. The estimated cost of the plant is $175,000. The life of such a plant is estimated to be at least 15 years. To arrive at the cost of treating ties the following items are considered:

First—Interest on $175,000 invested at 5 per cent compound interest for 15 years represents an annual charge of $12,587.

Second—Depreciation. Estimating the life of the plant at 15 years, we will charge off 6⅔ per cent or $11,666 annually.

Third—Insurance. The stock of ties, as well as the buildings should be insured and a reasonable estimate may place the annual premium at $5,000.

Fourth—Freight on Ties to Plant. It would not be right to charge all freight on ties to the treatment, but it may be reasonable to assume that every car of ties for treatment is hauled on an average of 100 miles, and we can base the freight haul on a rate of ½ ct. per ton per mile. Also estimate that cars will hold an average of 390 ties each, and that the ties will average 135 lbs. in weight. Thus, 1,500,000 ties will require 3,846 cars to haul them to the plant, and these ties weigh 101,-

250 cars. This represents an annual expenditure of $50,625.

Fifth—Switching. To switch 3,846 cars of ties, plus approximately 500 more containing preservatives, fuel, etc., or say a total of 4,346, in and out of plant at 50 cts. per car, will cost $2,173.

Sixth—Per diem on Cars. It is not always possible to unload ties the same day that they are received; in fact it often happens that they are delayed a week or more from one cause or another, in which case we are called upon to pay a per diem charge of 25 or 50 cts. For our present purpose it may be reasonable to estimate $1 per car, or an annual cost of $3,846.

Seventh—Operating the Plant. This will include all labor and material other than itemized above, estimated $300,000.

These expenses are summarized as follows:

	Total Cost Per Year.	Cost Per Tie.
First—Interest	$ 12,587.00	$0.0084
Second—Depreciation	11,666.00	.0078
Third—Insurance	5,000.00	.0033
Fourth—Freight on Ties	50,625.00	.0337
Fifth—Switching	2,173.00	.0014
Sixth—Per Diem on Cars	3,846.00	.0026
Seventh—Operating Plant	300,000.00	.2000
Total	$385,897.00	$0.2572

We do not know just what lift these ties will give, but it may be fair to assume twelve years for treated ties, and six years for untreated ties, or in other words, treating will double their life. For our purpose of comparison we will not consider tie plates in either case.

Untreated Ties.
(Life assumed as 6 years.)

First cost of tie (estimated)	$0.500
Insurance, interest, freight, etc. (as per statement "A")	.0435
Cost of putting in track	.150
Cost of tie in track	$0.693
5% compound interest on investment for six years	0.2320
Second renewal end of six years	0.6935
5% compound interest on 1st investment for six years and 5% on 2d investment for six years	0.5503
	$1.4758
Total cost of tie for period of 12 years	$2.1693
Average cost per tie per year	0.1808

Treated Ties.
(Life assumed as 12 years.)

First cost of tie (estimated)	$0.7572
Cost of putting in track	0.15
Cost of tie in track	$0.9072
5% on $0.9072 for 12 years	.7220
Total cost of tie for 12 years	$1.6292
Average cost per tie per year	.1357
Saving per tie per year	0.0451

Taking capacity of plant at 1,500,000 ties, this would show an annual saving of $67,650, which is nearly 39 per cent on the original investment of $175,000.

(Statement "A").
Untreated Ties.

	Total.	Per tie.
Insurance (assumed to be the same as with treated ties)	$ 5,000.00	$0.0033
Freight (assumed to be one-half as much as with treated ties)	25,312.50	0.0169
Switching 3,846 cars of ties in and out of storage yards at 50 cts. per car	1,923.00	0.0012
Per diem on cars (assumed to be the same as with treated ties)	3,846.00	0.0026
Handling ties in storage yard (unloading 1,500,000 ties from cars to ground at $0.007 each, and loading from ground to cars at same rate)	21,000.00	0.0070
Interest on 750,000 ties, or 5% on $375,000 (assuming that one-half the ties are in the storage yard constantly)	18,750.00	0.0125
	$75,831.50	$0.0435

During the month of February the contractors for the Roosevelt Dam of the Salt Lake project of the U. S. reclamation service have placed 8,000 cu. yds. of masonry, bringing the elevation of the lowest point to 180 ft. above stream bed and of the highest point to 235 ft. above stream bed. At the end of the mouth the dam was 93 per cent completed.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

New Formulas for Base and Bearing Plates.

Professor N. Clifford Ricker, professor of architecture, University of Illinois, has been making experiments having in view the production of accurate formulas for base and bearing plates. The results are given in Bulletin No. 35, University of Illinois Experiment Station, from which the following data are taken.

Complete formulas for plates of uniform thickness:

Let A = total area of plate in square inches.
P = total load in pounds transmitted by it.

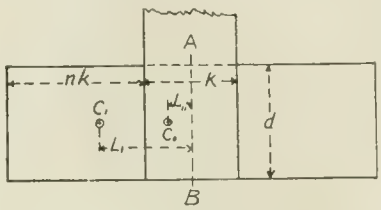

Fig. 1.

k = width of beam or girder resting on plate.
nk = distance from edge of beam or girder to edge of plate.
d = width in inches of the plate, usually equal to the thickness of the wall.
t = thickness of the plate in inches.

According to usual formulas for moment of resistance,

$$\frac{Pnk}{4} = \frac{fdt^2}{6}$$

Hence $t = \sqrt{\frac{3Pnk}{2fd}}$ for any material

with f = maximum safe fiber stress in pounds per square inch.

and $t = \frac{1}{103.3}\sqrt{\frac{Pnk}{d}}$ for steel plate $f = 16{,}000$ pounds.

$t = \frac{1}{44.7}\sqrt{\frac{Pnk}{d}}$ for cast iron $f = 3{,}000$ pounds.

$t = \frac{1}{40.8}\sqrt{\frac{Pnk}{d}}$ for cast iron $f = 2{,}500$ pounds.

The foregoing formulas refer to Fig. 1. If a square or cylindrical column stands on the bearing plate instead of the end of a beam resting thereon, the general formulas become:

$t = \frac{1}{103.3}\sqrt{\frac{P}{d}\left(\frac{nk}{2} + \frac{k}{4} - L''\right)}$ for steel plate. $f = 16{,}000$ lbs.

$t = \frac{1}{44.7}\sqrt{\frac{P}{d}\left(\frac{nk}{2} + \frac{k}{4} - L''\right)}$ for cast iron. $f = 3{,}000$ lbs

$t = \frac{1}{40.8}\sqrt{\frac{P}{d}\left(\frac{nk}{2} + \frac{k}{4} - L''\right)}$ for cast iron. $f = 2{,}500$ lbs.

in which L'' = perpendicular distance in inches from fracture line to center of downward pressures on one-half the area of the plate.

$L'' = 0.25 \times$ width of beam or girder on a bearing plate.

$L'' = 0.25 \times$ side of a solid square post or column.

$L'' = 0.2187 \times$ diameter of solid octagonal post or column.

$L'' = 0.2122 \times$ diameter of solid cylindrical post or column.

For hollow posts or columns L'' is found as follows:

Let R = radius of outer circle inscribed in cross section of hollow square or cylindrical column.

r = radius of inner circle inscribed in hollow square or round column.

Then $L'' = 0.500 \frac{R^2 - r^2}{R^2 - r^2}$ for a hollow square column.

Limiting values are $\begin{cases} 0.500\ R \text{ for a solid column.} \\ 0.750\ R \text{ for a very thin shell column.} \end{cases}$

Also $L'' = 0.424 \frac{R^2 - r^2}{R^2 - r^2}$ for a hollow cylindrical column.

Limiting values are $\begin{cases} 0.424\ R \text{ for a solid column.} \\ 0.637\ R \text{ for a very thin shell column.} \end{cases}$

These values of L'' may readily be found by calculation, but much more easily by the aid of the diagram, Fig. 2.

Example in use of Fig. 2: Assume a hollow cylindrical column, 12 ins. external and 9 ins. internal diameter.

Then $\frac{r}{R} = \frac{4.5}{6.0} = 0.75$.

By the diagram $L'' = 0.56\ R = 3.36$ ins.

In the experiments made at the University of Illinois by Mr. C. R. Dick, as thesis work under the direction of Professor Ricker, plates were designed by older formulas and tested to destruction. The fracture line was under the load and was in all cases a diameter of the plate, a shorter diameter when such was possible.

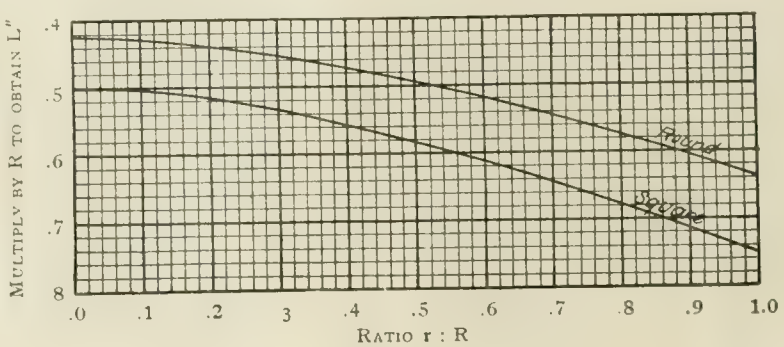

Fig. 2.

The formulas above given for cast iron bearing plates are also applicable to plates of the same material tapered in thickness from beam or column to each end, since the fracture section always remains rectangular in form. With tapered plates, nk = length in

inches of each tapered portion of the fracture section.

SQUARE PLATE (FIG. 3).

Let S = side of square plate in inches.

then $t = \sqrt{\frac{3P}{fS}\left(\frac{S}{4} - L''\right)}$

$t = \frac{1}{73}\sqrt{\frac{P}{S}\left(\frac{S}{4} - L''\right)}$ for steel f = 16,000 lbs.

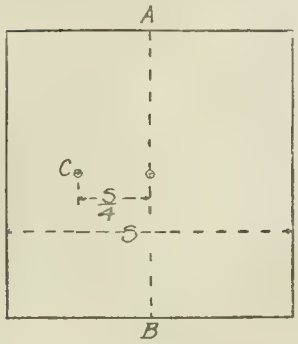

Fig. 3.

$t = \frac{1}{31.6}\sqrt{\frac{P}{S}\left(\frac{S}{4} - L''\right)}$ for cast iron f = 3,000 lbs.

$t = \frac{1}{28.9}\sqrt{\frac{P}{S}\left(\frac{S}{4} - L''\right)}$ for cast iron f = 2,500 lbs.

OCTAGONAL PLATE (FIG. 4).

Let D = inscribed diameter of polygon.

$L' = 0.2187\ D$.

then $t = \sqrt{\frac{3P}{fD}}\ (0.2187\ D - L'')$

$t = \frac{1}{73}\sqrt{\frac{P}{D}}\ (0.2187\ D - L'')$ for steel. f = 16,000 lbs.

$t = \frac{1}{31.6}\sqrt{\frac{P}{D}}\ (0.2187\ D - L'')$ for cast iron f = 3,000 lbs.

$t = \frac{1}{28.9}\sqrt{\frac{P}{D}}\ (0.2187\ D - L'')$ for cast iron. f = 2,500 lbs.

L' = perpendicular distance in inches from fracture line to center of upward pressures on one-half the area of the plate.

Then $L' = 0.25 \times$ length in inches of a wall or bearing plate.

$L' = 0.25 \times$ side of a square plate.

$L' = 0.2187 \times$ inscribed diameter of octagonal plate.

$L' = 0.2122 \times$ diameter of a circular plate.

CIRCULAR PLATE (FIG. 5).

Let D = diameter of the plate in inches.

$L' = 0.2122\ D$.

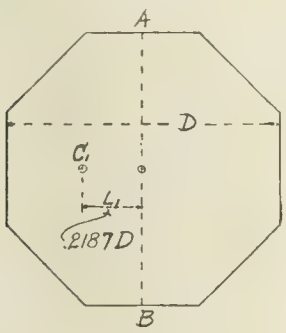

Fig. 4.

then $t = \sqrt{\frac{3P}{fD}}\ (0.2122\ D - L'')$

$t = \frac{1}{73}\sqrt{\frac{P}{D}}\ (0.2122\ D - L'')$, for steel. f = 16,000 lbs.

$t = \frac{1}{31.6}\sqrt{\frac{P}{D}}\ (0.2122\ D - L'')$ for cast iron. f = 3,000 lbs.

$t = \frac{1}{28.9}\sqrt{\frac{P}{D}}\ (0.2122\ D - L'')$ for cast iron. f = 2,500 lbs.

PLATES OF TAPERED THICKNESS.

These comprise all cast iron base plates, which are always made thinner at their edges for the sake of economy. Bearing plates of cast iron set on walls, however, have a rectangular fracture section, for which direct formulas have already been given. When the plates are tapered the formulas become somewhat complicated and the work is simplified by the use of the diagram given in Fig. 6.

Let t = thickness in inches at middle.

t' = thickness in inches at edge.

n = ratio between k and length in inches of each tapered portion.

1. Assume n.

2. Compute the thickness for a rectangular fracture section.

3. Assume the desired ratio $\frac{t'}{t}$ of thickness at edge and middle.

4. On the right of Fig. 6 the ratio $\frac{t'}{t}$ is found and along the top are values of n. With the assumed values determine the per cent, @, of the resistance of the plate in comparison with a plate of rectangular section of equal width and thickness.

5. By the following formula compute the required actual thickness t at the middle of the plate. Then t' is easily found.

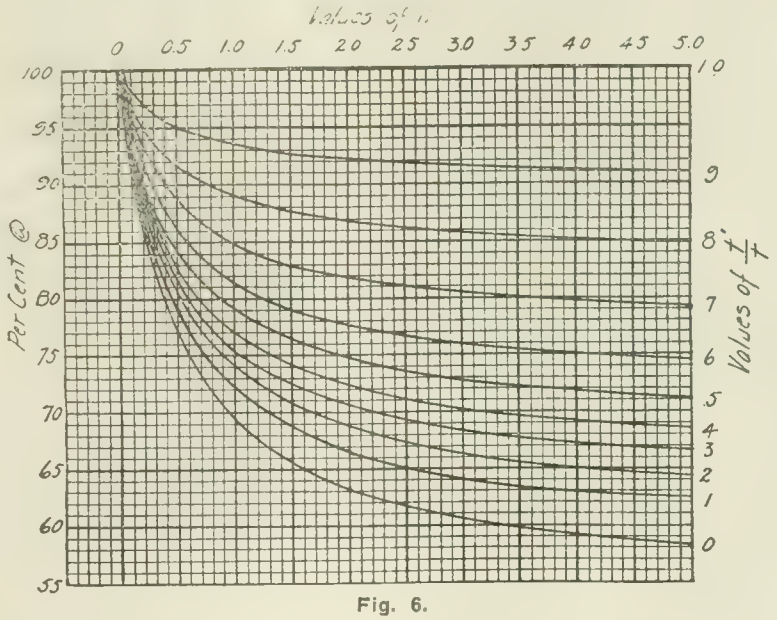

Fig. 6.

$t = \sqrt{\frac{100}{@}} \times \frac{1}{50}\sqrt{\frac{3P}{B}}\ (L' - L'')$ for cast iron.

in which $B = k\ (2n + 1)$ = length in inches of fracture section.

The bulletin contains a full account of the experiments and a study of the results whereby the formulas were obtained. The examples worked out by the author show that simple formulas and diagrams have been devised, making the design of safe bearing and base plates a very simple matter. Diagrams are given showing ratio of r/R, values of ratio n, values of strength per cent @, dimensions of plates, relations of $\sqrt{\frac{3P}{B}}$, $L' - L''$, and t, with typical examples worked out.

Boyes, Hulshizer & Co., Seward, Nebr., owners of the Seward flouring mill, have made a proposition to the city of Seward to rebuild their dam on the Blue River and put in a power plant to furnish electricity to the city, providing the city will enter into a ten-year contract for the electricity.

LETTERS TO THE EDITOR.

Hydraulic Filling Using Long Pipe Lines and Relay Pumps.

Sirs:—Referring to Mr. Allan's description on method and cost of hydraulic filling at Cairo, Ill., in your issue of Feb. 16, I beg to call attention

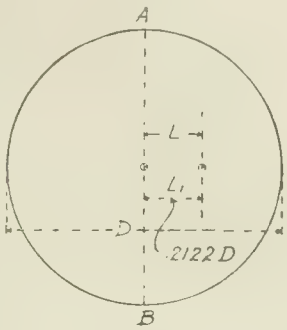

Fig. 5.

to more ambitious and successful delivery through long pipes at Galveston, Tex., by the North American Dredging Co., of which I was then engineer and New York agent. I do not claim to have designed the installation, as it was in operation before I joined the company.

While the outfit could have been improved by purchasing new machinery in general harmony of proportion and style, it was nevertheless as successful as could be expected and using a large proportion of second-hand material for the relay stations. As the whole matter is a world's record as far as is known, it may be of interest to your readers, and I present the data in tabular form:

Diameter of pipe	20 ins.
Maximum pipe length	11,000 ft.
Maximum vertical lift	17 ft.
First pump, 20-in. regular suction dredge.	
Dredge location on inside marsh.	
Material 10 ft. top mud and 20 ft. sand below.	
Dredge pump engine 500 H. P.	
First relay plant, fixed steam engine boiler and pump, and also an electric generator for second relay.	
Second relay, semi-portable.	
Second relay machinery, electric motor and pump.	
Material handled per month	120,000 cu. yds.
Engine hours per month	600 to 630
Contract price per cu. yd. of filling	about 21 cts.

It will be noted that the material was pumped twice as far as at Cairo, with about half the Cairo lift and the friction head made the total resistance fully up to the Cairo total.

All records were broken for continuous engine hours per month, and as many as five days in one month showed 24 hours continuous opera-

tion without a single minute lost by stoppage from engine and pump.

It is obvious that if the Cairo people had possessed the experience of the old hydraulic dredging companies, they would have avoided many of the troubles which required re-arrangement of their plant, and they would not have needed to use a double suction pump to avoid thrust at the sacrifice of simplicity and convenient access. The fact remains, however, that it is a bold undertaking to pump coarse sand through such small pipe for such great distances and the pumps would have lasted much longer, and the delivery would have been considerably higher if two relays had been used instead of one, and especially if both could have been electrically driven.

Yours very truly,

H. S. Wood.

New York, N. Y., Feb. 24, 1910.

What Caused the Failure of the Dansville Dam?

Sirs. In your issue of March 2, 1910, Mr. R. C. Beardsley criticises very severely my letter in the issue of Feb. 2 commenting on the failure of the Dansville dam. He jumps to the conclusion that I advocated a certain method of design, whereas in the second paragraph of my letter appears the following sentence: "I do not blame poor workmanship, except as a contributing cause, for the design in my opinion is poor."

My letter was written in defense of the contractor. Several accounts of the failure of this dam had appeared in leading technical papers. In all accounts the failure was blamed on the contractor, whereas in my opinion the failure of the dam was due to faulty design. I did suggest that if the designer had computed the forces acting against the face he might have reinforced the bottom slab, but that was not an approval of his work, which I had already condemned.

There are plenty of standard texts on the building of dams, not the least of which must be ranked the excellent book by Mr. Beardsley, so it is not difficult for designers to secure safe guidance. The discussion so far elicited, and which Mr. Beardsley wonders at, seems to be unanimous on one point, which is that the design was faulty.

Chicago, March 8, 1910. Q. E. F.

A Method of Determining Relative Economy.

Sirs: I am in receipt of Engineering-Contracting of Jan. 19 which contained an article by me on "A Method of Determining Relative Economy, With Rules and Tables for Practical Computation." In looking this over I note that the bracket has been omitted at the end of equation (5); also notice that an error has been made in print by the omission of the prime sign (′) for the N of the denominator of the second fraction of the first term of the seventh equation. Equation (7) should be written as follows:

$$\left[\frac{(1+K)^N}{(1+K)^N-1} - \frac{1+K)^{N'}-1}{(1+K)^{N'}}\right] C$$

Very truly yours,

SHELBY S. ROBERTS.

1018 West Nevada St., Urbana, Ill., Feb. 18, 1910.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Institute of Mining Engineers.
March 1-5. Annual meeting at Pittsburg, Pa. Secy., R. W. Raymond, 29 West 39th St., New York City.

American Railway Engineering and Maintenance of Way Association.
March 15-17, 1910. Annual convention at Chicago, Ill. Secy., E. H. Fritch, 962 Monadnock Block, Chicago, Ill.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

Notes from Technical Societies.

Annuel meeting of the Iowa Engineering Society.—The twenty-second annual meeting of the Iowa Engineering Society was held at Cedar Rapids, Iowa, Feb. 16 and 17. An enthusiastic meeting was reported, about thirty members being present. The welcoming address was made by Mr. Matt J. Mile, Mayor of Cedar Rapids. A paper on "Concrete Construction in Cold Weather" was read by Mr. J. H. Chubb. Mr. A. H. Ford spoke on "Rates for Electric Service." The "Direct Method in Illuminating Engineering" was discussed by Mr. L. B. Spinney.

Monthly Meeting of the Engineers' Society of Western Pennsylvania.—The monthly meeting of the Engineers' Society of Western Pennsylvania was held Feb. 15 at Pittsburg, Pa. Mr. Elmer K. Hiles was re-elected secretary for the ensuing year. A feature of the programme was a paper presented by Mr. J. C. Roberts, Assistant Chief Engineer Technologic Branch, U. S. Geological Survey, on "The Government Testing Station in Pittsburg." An exhaustive description of the work accomplished, as well as that taken up in connection with the testing of structural materials and the causes and prevention of mine accidents, was given. The saving of waste coal, the testing of explosives and safety lamps, and the provision of rescue stations and rescue apparatus were among the topics enlarged upon. The society made arrangements for an inspection trip to the testing station in Pittsburg on Feb. 26. Tests of explosives found in coal dust, safety lamp tests, tests of fire brick, etc., will be made. In addition a practical demonstration of rescue work as carried out in the mines will be given.

Canadian Cement and Concrete Association Exhibition.—The annual exhibition and convention of the Canadian Cement and Concrete Association will be held at London, Ont., March 29-April 1. Particulars in regard to special railroad rates, admissions, etc., will be supplied by Mr. R. E. W. Hogarty, secretary of the association, 662 Euclid avenue, Toronto. The convention will be held in London, Ont., during the exhibition. Arrangements are being made for a programme, with addresses by representatives of cement and concrete engineering, manufacturing and contracting firms from various parts of Canada and the United States. A complete programme will be printed later.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Cement.—Paper 10x13½ ins. 6 pp. Ash Grove Lime & Portland Cement Co., R. A. Long Bldg., Kansas City, Mo.

Shows the cement dealer how this company advertises their product for the benefit of the dealer. Contains a number of sample advertisements to be run in the dealers' local paper, also tells of the arguments advanced to the prospective user for the products manufactured by this company.

Uses of Mineral Oil Mixed Concrete.—Paper 6x9 ins. 8 pp. Vulcanite Portland Cement Co., Philadelphia, Pa.

This pamphlet contains an able discussion on concrete mixed with mineral oil, with test records and other valuable information, as well as a few remarks on the methods used in the manufacture of this company's product.

Dump Wagons and Dump Boxes.—Troy Wagon Works Co., Troy, O.

Two little folders sent by this company describe in a concise manner a dump wagon and a portable dump box made by them. The use of the dump box in converting an ordinary teaming or farm wagon into a dump wagon for sand, gravel, crushed stone, etc., is explained.

Steel-Bound Concrete Curb.—Paper 4¾x7 ins. 16 pp. Steel Protected Concrete Co., Real Estate Trust Bldg., Philadelphia, Pa.

Contains directions for laying steel-bound concrete curbs. Explains with the aid of diagrams, the methods of excavating trenches, building forms, laying the concrete and setting the corner bar. Also shows how to set forms having curves, giving process of finding length and location of any desired curve.

Concrete Construction.—Paper 6x9 ins. 8 pp. Aberthaw Construction Co., Boston, Mass.

Contains a number of handsome photographs of buildings erected by this company.

Pile Driving Hammer.—Paper. 4x7½ ins. 12 pp. Aug. A. Goubert, 90 West St., New York, N. Y.

This pamphlet describes the Goubert steam pile driving hammer. The principles of pile driving and the essentials of a steam hammer are discussed.

Aggregate.—Paper. 6x9 ins. 15 pp. Edison Portland Cement Co., New Village, N. J.

This booklet tells about the $10,000,000 Chelsea dock improvement of the city of New York. A number of views of the elaborate ornamental concrete work on the dock front are shown.

Track Devices.—Paper. 6x9 ins. 55 pp. Q. & C. Co., Old Colony Bldg., Chicago, Ill.

A well prepared catalogue of rail joints, anti-rail creepers, guard rail clamps, braces, portable saws, rail benders, and other rail devices. Also describes, a deformed bar, a metal and cement tie and a surfacing and rail lining block sold by this company. In addition, contains dimension sheet on Am. Soc. C. E. and Am. Ry. Assoc. rail sections, with some useful information on weights and measurements, together with some handy tables on railway construction work.

Fabricated Reinforcement.—Paper. 6x9 ins. 16 pp. Corrugated Bar Co., Bank of Commerce Bldg., St. Louis, Mo.

A detailed description of the fabricated concrete reinforcing products of this company with some well chosen arguments on the advantages of the design used by them.

Core Drills.—Paper. 6x9 ins. 60 pp. Terry Core Drill Co., 50 Church St., New York, N. Y.

This book gives full information on core drills for prospecting, testing, blasting, etc., made by this company. Also contains instructions for setting up and operating core drills, with lists of appliances needed for equipping different classes of drills.

Draughting Specialties.—Paper. 3¼x5¼ ins. 8 pp. Henry V. St. George, Inc., 10-14 Grand St., New York, N. Y.

Describes the heliographic process of outlining tracing sheets and printing titles, comparing the cost of doing this work by hand with that of the above mentioned process.

Expansion Bolts.—Paper. 6x9 ins. 17 pp. A. C. Seaman, 1638 Hutchinson St., Philadelphia, Pa.

This is the revised 1910 price list on expansion bolts made by this firm. A description of the different kinds of bolts with illustrations is given.

Hoisting Machinery.—Paper. 5x6¾ ins. 110 pp. S. E. Parker, Chicago, Ill.

A complete catalogue of derricks, drums, cranes, elevators, barrows and carts, and hoisting equipment. Fully illustrated with cuts showing details of all machines and method of setting up and operating.

Contractors, Engineers and Railroad Supplies.—Paper. 9¾x12 ins. 12 pp. G. W. Cole, 50 Church St., New York, N. Y.

An illustrated catalogue of dump wagons, plows, scrapers, barrows, pumps, etc., and contractors' hand tools with price lists on each.

Smith Mixer.—Paper, 6x9 ins., 36 pp. The T. L. Smith Co., Old Colony Bldg., Chicago, Ill.

This catalog anticipates and answers every question a prospective purchaser might ask. Line drawings are given of different sizes for the assistance of draftsmen in designing installations.

Rubber Belt Conveyors.—Paper, 3½x6 ins., 24 pp. The Jeffrey Mfg. Co., Columbus, O.

Contains much useful information on the subject of rubber belt conveyors and belts for power transmission.

Reinforced Concrete Design. — Trussed Concrete Steel Co., Detroit, Mich.

For the quick and accurate design of slabs this company has issued a pocket circular slide rule. With one setting, knowing the span and load, is found the thickness of slab and amount of steel. On the back is a table of beams and girders with reinforcement required. Full directions accompany this rule.

Acme Wagons.—Acme Wagon Co., Emigsville, Pa.

This company sends in several envelope size folders describing dump wagons and stone spreader wagons for the use of contractors and municipalities.

The York Gas Engine.—Catalog 9-B. Paper, 6 x9 ins., 48 pp. Flinchbaugh Mfg. Co., York, Pa.

This is a very complete catalog of engines operating by use of standard gas, producer gas, gasoline, kerosene and alcohol. Stationary and portable outfits are illustrated, together with a traction engine propelled by an internal combustion engine.

Farquhar Machinery.—Paper, 9x12 ins., 70 pp. A. B. Farquhar Co., Ltd., York, Pa.

This catalog illustrates road engines, portable engines, boilers, sawmills, horse powers, crushing plants, etc.

Reinforced Concrete Design, No. 1.—Paper, 3½x6 ins., 70 pp. Northwestern Expanded Metal Co., Chicago, Ill.

This company about two years ago commenced issuing a series of booklets on reinforced concrete design. The present booklet is a consolidation of the first five and parts of two more, with additional matter. It is a useful pocket book on design of beams, slabs, columns and sidewalks, containing also data on stucco for houses. Tables and diagrams are given, the intention being to make it of use to architects, contractors and engineers.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week. Several fairly large railroad construction contracts have been let since our last issue among them being the following: The Texas Co., Fort Worth, Tex., for constructing the first 20 miles of grade for the Brownwood North & South Ry., from Brownwood, Tex., to May, Tex.; the Hauser Construction Co., Los Angeles, Cal., for constructing the Fullerton-Richfield cut off, five miles, for the Santa Fe.; Robert Grace, 830 Schofield Bldg., Cleveland, O., for excavation work on the new yards of the B. & O. R. R., at Chicago Junction, the contract amounting to something like $1,500,000; the Jennings Construction Co., Joplin, Mo., for constructing the first section of the Arkansas Valley Interurban Ry., between Wichita, Kan., and Valley Center, Kan.; Theodore Lutguerding, Wichita, Kan., for constructing the Wichita, Kinsley, Scott City & Denver Air Line Ry.; Smith & Scott, Garden City, Kan., for constructing a section on the Nebraska, Kansas & Southern Ry.—One feature of the week worthy of note is the large number of electric railways which have advanced preliminary arrangements so far that they will shortly let contracts for construction work. Among these companies are the following: The Houston-Galveston interurban line to connect the two cities named; the Slippery Rock & Grove City Traction Co., for a 9 mile line from Slippery Rock, Pa.; the Niagara Frontier Traction Co., for an 8 mile line from Niagara on the Lake, Ont.; the Aberdeen Ry. Co., for six miles of street railway in Aberdeen, S. Dak., and the Cherryvale, Oklahoma & Texas Ry., for a 62 mile line from Caney, Kan., to Nowata, Okla.—The contract for the construction of one of the largest private irrigation systems in the west was let during the past week. This contract calls for the construction of the irrigation systems of the Colorado Southern Irrigation Co., and the Canon City, Florence & Pueblo Water Co., in Colorado. The contract amounts to $12,987,000, and was secured by Kenefick, Quigley & Russell, Denver, Colo., and Kansas City, Mo.—Two large municipal contracts have also been let recently. The first of these calls for the construction of the dam, spillway, etc., at the White Rock reservoir site for the city of Dallas, Tex. The other contract calls for the construction of the headworks and tunnel for the power plant on the Nisqually River for the city of Tacoma, Wash. The contract price was $655,255, and the contract was secured by Wright & Sweeney Co., Pacific Ave., Tacoma. The work includes a tunnel 8 ft. in diameter and 100,000 ft. long.

Battleships. Our little friend the Argentine Republic seem to have slipped one over on the English and other foreign ship builders in the recent award of contracts for two battleships. In the beginning Argentina issued a request to the warship builders of the world for the submission of battleship designs fulfilling stated conditions. Some 20 firms replied to the request and prepared at least 60 designs and specifications the preparation of which probably cost at least $100. These didn't seem to be satisfactory to Argentina and another set of designs was asked. The ship builders complied and again prepared which probably cost at least $100,000. These also were not satisfactory and the government went through the process for the third time, and then to the ire of our British cousins especially awarded the $22,000,000 contract to an American firm, the Fore River Ship Building Co., of Massachusetts. And now the British ship building interests are claiming that Argentina by its cleverness in asking for the many designs, has obtained a host of secrets relative to British battleship constructions.

Levee Work in Missouri. The State Labor Bureau of Missouri is doing good work in its efforts to convince the land owners of that state that a concerted effort should be made to protect their lands from floods. Figures issued recently by the Bureau show that the damage to crops alone in the 53 counties of the state from the floods of July 1909 amounted to $18,896,340. In one county alone crops valued at $1,500,000 were destroyed, and 1909 was an off year for floods in Missouri. In the counties along the Missouri River the flood damage to crops in 1909 was $8,629,750. As the channel of the Missouri River from the Iowa line to the river's mouth north of St. Louis is about 575 miles long the crop loss per mile of river channel in 1909 was over $15,000. The Bureau estimates that the average cost of constructing new channels for small rivers and building levees will not exceed $15 per acre of land benefited; whereas the average loss of crops in one flood year is now from $18 to $25 per acre. The report of the State Labor Bureau from which the above figures are taken concludes as follows: It is not wisdom or economy for our property owners to longer neglect their land and leave it at the mercy of the floods. Land owners are committing an unpardonable sin by not conserving the land which our Creator placed here for the use and support of not only the present owners, but future generations. They should not feel as did the profligate French king who often declared: "Things will outlast our time." The Lord no longer speaks to the people by word of mouth and warns them of the deluges that are coming, as did he to the Patriarch of old, but he has taught us by example that floods will visit our low lands, and we should prepare for their coming, not as did Noah, by building an ark, but by constructing levees and other forms of protection to keep back the water. If the farmers persist in ignoring these warnings they should not murmur when their crops are swept away.

The Discoverer of the Water Jet. The water jet has been used for so many years both in putting down and pulling piling that its original discoverer has long since been lost sight of. It was used during the civil war and for many years previous by government engineers. Tradition has it that the discoverer of the advantages of the water jet was a government engineer, and that his discovery was made in the following manner. It seems that along in the forties this engineer was building a wharf, and was having unusual difficulty in putting down his piling. One day in wading around his boots became stuck in a tenacious mud and he found it impossible to pull them out. There happened to be a hose nearby and one of the men handed it to the officer, the idea being that he could wash the mud away from his boots. The water was turned on and the officer applied a stream to his feet. To his surprise he sank deeper. He tried it again and went down still further in the mud. By this time he was in up to his waist and still going down. Surprised by his discovery he continued to apply the stream to his feet and he might be going down yet had not his men came to the rescue and pulled him out by means of a small hand derrick. Once on shore he began to think. If a stream of water applied to a man's feet will cause him to sink deeper in the mud, why won't it have the same effect if applied to the base of a pile. He tried it and the pile which had obstinately refused to go down before sunk easily to place, and in that way states tradition was discovered the use of the water jet for putting down piling.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

F. C. Kyte, Carlisle, Ark., chief engineer Meto Valley R. R., has finished final survey of 40 miles for the Stuttgart Rice Belt R. R., from Devalls Bluff south through Stuttgart to Cummins Crossing on the Arkansas River, Construction work is to start this spring.

Contracts will be let by the County Court of Clay County, at 9 a. m., March 26, at the court house in Piggott, Ark., for the construction of main ditch and laterals in Drainage district No. 9. The work is located 5 miles east of Piggott at the upper end and the outlet is in the St. Francis River, 10 miles southeast of Rector, Ark. The total yardage is 470,927, and it is all dredge work. At the same time contracts will also be let for constructing four laterals requiring the removal of 19,350 cu. yards by team work. J. D. Mitchell, Rector, Ark., is the engineer.

CALIFORNIA.

The Atchison, Topeka & Santa Fe Ry. Coast Lines is about to put into execution a plan that has long been contemplated for the time when its overland freight business to and from Los Angeles should become heavy enough to warrant the outlay; that is, the building a line in Southern California, from Fullerton to Richfield. A great deal of the freight business between Los Angeles and San Bernardino is handled by way of Orange because of the low grades, and by the construction of this cut-off the mileage is diminished between these points eight miles, the new line being five miles in length. The cut-off will be constructed under the name of the Fullerton-Richfield R. R., and the contract has been let to the Hauser Construction Co., Los Angeles, Cal.

GEORGIA.

A company will be organized during this month to build a steam railroad from Toccoa to Carnesville, Ga., a distance of 20 miles. The required amount of money has been subscribed, the survey made and the contract will be let in the next few days. Contractors and dealers in supplies and machinery can address W. S. Erwin at Clarksville, Ga.

The Rome & Northern R. R. now has surveys under way for an extension from Gore to Tunnel Hill, Ga., a distance of 33 miles. Construction contracts will be let in about 30 days. H. M. Smith, Rome, Ga., is chief engineer.

IDAHO.

The Payette Valley Extension R. R. Co. (Payette Valley R. R.) has completed surveys and has secured the capital for the construction of a 19-mile extension to the Payette Valley Ry. Construction contracts will be let in about 30 days. C. W. Nibley, 14 North Main St., Salt Lake City, Utah, is president, C. P. Lattig, Payette, Idaho, is chief engineer, and H. E. Dunn, Payette, Idaho, is vice president and general manager.

IOWA.

Surveys are now being made for the projected 20 mile line of the recently incorporated Charles City Western Ry. Co. About $300,000 capital has been secured for the construction of this line, which is to extend from Charles City in a Southwesterly direction. No definite date has been set for awarding contracts. C. W. Hart, Charles City, Ia., is President. A. W. Dennis, Charles City, is also interested.

KANSAS.

Smith & Scott, Garden City, Kan., have been awarded the contract for constructing a portion of the Nebraska, Kansas & Southern R. R. The projected length of this road is 162 miles, and it is to extend from Omaha to El Paso. Surveys have been made and construction capital has been secured. Baxter Brown, St. Louis, Mo., is Chief Engineer, and J. C. Hopper, Ness City, Kan., is President.

Surveys have been started for the projected 62-mile line of the Cherryville, Oklahoma & Texas Ry. The capital for construction has been secured and construction contracts will be let as soon as locations are completed. The route is from Caney, Kan., to Nowata, Okla. and Vinita, Okla., S. M. Porter, Caney, Kan., is president and B. J. Dalton, Lawrence, Kan., is chief engineer.

MICHIGAN.

W. E. Tench & Co., 210 John R. St., Detroit, Mich., has been awarded the contract for constructing the Lansing & Owosso Electric Ry. between Lansing, Mich., and Owosso, a distance of 30 miles. The contract includes 250,000 cu. yds of earth excavation. Practically all of the work has been sublet, the subconstractors being Myron Warkley, Shaftsburg, Mich.; C. J. Snyder & Son, Perry, C. E. Swain, Owosso, Mich.; E. E. Thomas, Perry, Mich., and John Evans, Morrice, Mich. Tench & Co. are also working two steam shovel outfits. The Northern Construction Co., Morrice, Mich., will build all of the bridges, etc. All work is to be completed by Aug. 1, 1910. The headquarters of Tench & Co., on this work are at Morrice.

NEBRASKA.

Bids are asked until 10 a. m., April 4, by the Commissioners of Drainage District No. 2, C. M. Linn, secretary, Humboldt, Neb., for the construction of about 11 miles of new channel for the Nemaha River, requiring the moving of about 810,000 cu. yards, about 14,000 cu. yards of Long Branch Channel, about 6,320 cu. yards of Long Branch levee, about 2,640 squares of river cleaning and the furnishing and construction of three steel bridges over the new channel of the Nemaha River. All work is to be completed by April 1, 1911. Plans, etc., are let at office of Frank Snethen, Humboldt, Neb. The official advertisement will be found elsewhere in this issue.

NEW JERSEY.

Surveys have been made and practically all of the capital has been secured for the construction of the proposed line of the Wildwood & Delaware Bay Short Line R. R. The projected length of this line is seven miles and it is to extend from Wildwood, N. J., to the Reading R. R. at Rio Grande and then on to Delaware Bay. Construction contracts will be let in one to three months. Curtis Baker, Wildwood, N. J., is President; Harry C. Wier, Wildwood, is Chief Engineer.

OHIO.

The matter of beginning construction work on the proposed Ohio & Pennsylvania Belt Line R. R. has been postponed until fall or later. As stated in our March 2 issue, this is to be an independent belt line railroad to extend from Youngstown, O., to Lawrence Junction. Robert Bentley, Lowellville, O., is interested.

PENNSYLVANIA.

Contracts will probably be let by April 15 for the construction of the projected 9-mile line of the Slippery Rock & Grove City Traction Co. The route of this road is north along the east side of Wolfe Creek from Slippery Rock to Armstrong, Barmon Lake and Grove City. John P. Barr, Grove City, Pa., is president and H. B. Graves, Butler, Pa., is engineer.

Surveys have been made and capital has been secured for the construction of the projected 40 mile line of the Johnstown & Altoona Ry. Co. Construction contracts will be let June, 1910. This road is to extend from Johnstown to Altoona, passing through South Fork, Cresson, Gallitzen and eight other towns. George Holman, 302 Suppes Bldg., Johnstown, Pa., is Chief Engineer.

SOUTH DAKOTA.

The Aberdeen Ry Co. has surveys underway for 6 miles of street railway in Aberdeen, S. D., and will let construction contracts in about three weeks. F. D. Brown, Aberdeen, S. Dak., is chief engineer and Charles N. Herreid, Aberdeen, is president.

TEXAS.

The Morey-Faulhaber Construction Co., Lometa, Tex., will sublet part of 30 miles of grading in quantities to suit outfits at good prices.

D. J. Grigsby, Dallas, Tex., has been awarded the contract for constructing the Temple & Northwestern Ry., as stated in our last issue. The projected length of this road is 210 miles and it is to extend from Temple via Galesville., Hamilton, Comanche, Gorman and Eastland. Surveys have been made for 75 miles of the road and the capitol for construction has been partially secured. W. J. McDaniel, Temple, is president, W. E. Dozier, Temple, is chief engineer, and E. L. Trimble, Temple, is secretary.

The contract for the first 20 miles of grade work, including grading, cleaning and grubbing on the Brownwood North & South Ry., from Brownwood to May, was let to the Texas Co., of Fort Worth, Texas, on March 10th. John Meade, Brownwood, Tex., is Chief Engineer.

Col. R. A. Love, who will build a railway from Brownwood to Rockwood, a distance of 30 miles, has employed A. B. Carson as Chief Engineer, and has placed a party in the field. He will be in position to let the contract and begin actual construction inside of 30 days. The road is to be known as the Brownwood Southwestern, as mentioned in our last issue.

Montgomery Bros., Marshall, Tex., have started work on their grading in eastern Texas on the Western Colonial R. R. The contract includes 75,000 cu. yds. earth excavation, 45,000 cu. yds. rock excavation and 115,000 cu. yds. of embankment. Montgomery Bros. have about 75,000 cu. yds. of the work which they will sublet at once. The subcontractors already on the line are Jno. L. Williams and Frank Madlock. It is expected that the work will be finished by July 1, 1910.

WASHINGTON.

Wright & Sweeney Co. Pacific avenue, Tacoma, Wash., have been awarded the contract for constructing the headworks and tunnel for the power plant on the Nisquelly River for the city of Tacoma. Bids for this week were opened Feb. 21, and the contract price was $655,225. The work includes the construction of a tunnel 8-foot in diameter and 10,000 feet long.

CANADA.

The Niagara Frontier Traction Co. has been formed and proposes the construction of an 8-mile electric railway from Niagara on the Lake, Ontario to Queenstown. Contracts are to be let as soon as the company secures its charter. E. Garrett, Niagara Falls, Ont., is president and general manager.

ONTARIO.

Bids are asked by P. E. Ryan, Secretary the Commission of the Transcontinental Ry.,

Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent 30 x 49 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160.00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

Ottawa, Ont., until noon, March 23, for furnishing 24,733 gross tons of open hearth or Bessemer steel rails and necessary splice bars, track spikes, bolts and nuts, nut locks and tie plates. Specifications can be obtained from Gordon Grant, Chief Engineer, Ottawa, Ont.

Power Developments, Levees, Drainage and Irrigition Works.

CALIFORNIA.

There are no new developments as yet regarding construction work in the South San Joaquin Irrigation District. The bond issue of $1,875,000 voted on Dec. 30th, 1909, is now being reported upon by a New York firm of bond lawyers. If all proceedings are found to be correct, the bonds will then be printed—but it is not likely that the printed bonds will be received complete for a month or two yet. Then an effort will be made to sell them for *cash*—and it will not be until they are so sold that the contractors will be asked to bid on the work. Edwin Duryea, Jr., 1314 Humboldt Bank Bldg., San Francisco, is engineer for the district.

MAINE.

Bids are asked until April 14, by the Rumford Falls Power Co., Rumford, Me., Charles A. Mixer, Engineer, for the following work: For the ledge excavation and masonry cradles for 1,000 ft. of 14 ft. penstock, for the relief pipe concrete spillway, for machinery and building excavations and concrete foundations, for the brick and concrete station building, and for the cofferdam and ledge excavations of the tail race. The work is to be done for an addition to the present power station. The work includes 4,000 cu. yds. ledge excavation, 500 cu. yds. ruffle masonry, 1,200 cu. yds. concrete and 112 M. brick work. The official advertisement will be found elsewhere in this issue.

MONTANA.

Contracts will be let soon for more than 40 miles of canals for the Glen Lake Irrigation project. A considerable amount of reinforced concrete will be used in headgates, dams and pipes. F. E. March, Kalispell, Mont., is engineer.

NEW JERSEY.

Bids are asked until noon, April 1, by Col. Wm. T. Rossell, U. S. engineer, 39 Whitehall St., New York City, for dredging in Passaic River and Shrewsbury River, N. J. About $4,000 is available for the Shrewsbury River work and $12,000 for the Passaic River work. The latter work consists in removal of shoals, maintaining, continuing or enlarging the channels in the vicinity, of Belleville, Indian Reef, and Rutherford Park Bars, in the channel between Rutherford and Passaic, and in any part of the river between the Montclair and Greenwood Lake Railroad bridge and the City of Passaic. The low water depth ot be made will be 6 feet.

NEW YORK.

Bids are asked until noon March 29, by Col. W. M. Black, U. S. engineer, 39 Whitehall St., New York City, for dredging in Patchogue River, Great South Bay, N. Y., and Brown's Creek, N. Y. The work is to be done in connection with the preservation and maintenance of river and harbor waters for Great South Bay. About $5,500 is available for the Patchogue River work and $4,000 for the Brown's Creek work.

NORTH CAROLINA.

Bids are asked by the Commissioners of Bear Swamp Drainage District, W. J. Berryman, Secretary, Edenton, N. C., until March 26, for construction of canals, including one main canal and five branches, amounting to 145,000 cu. yds. Plans, profiles, specifications and other information may be had of Patrick Matthews, Chief Engineer, Superintendent of Construction, Edenton. Two other large districts are to be opened right away in adjacent terrjtory.

OHIO.

T. Brindle, county surveyor Ashland County, will sell at public outcry, at the Commissioner's office, Ashland, at 1 p. m., March 18, the contract for straightening, widening and deepening the Jerome Fork branch of the Mohican River in Orange, Montgomery, Perry and Mohican counties. The work will include 9⅝ miles of dredge work in the channel or about 285,000 cu. yds. estimated to cost $28,500, and about 28,000 cu. yds. of dredge work in three laterals; also about 11,530 cu. yds. of hand and team work.

TEXAS.

The Fred A. Jones Co., Dallas, Tex., has been awarded the contract for constructing the dam, spillway, etc., at the White Rock reservoir site for the city of Dallas. The dam is to have a clay-filled trench from end to end. Before the filling with clay sheet piling of pine is to be driven in the bottom of trench to hard pan, or white rock. The earthen dam is to be 2,100 ft. long and about 42 ft. high at is greatest height. It is to be 211 ft. wide at the base and 16 ft. wide at the top. From the top to a line about half way to the bottom of the upstream side there is to be a concrete apron from end to end of the dam. The spillway of concrete at the western end of the dam will be 450 ft. wide. The spillway will have over it a reinforced concrete walkway and the upstream end of the piers of this walk will be furnished with cast iron guides for flash boards. Bids for the work were opened Feb. 16.

UTAH.

Bids are asked by the Upper Blue Bench Irrigation District, Jackman Herrick, Secretary, Theodore, Utah, until noon April 9, for materials and constructing a main irrigating canal from Rock Creek to the eastern edge of the Blue Bench, a distance of 13.56 miles. Plans, etc., may be seen at the office of Ed. F. Harmston, Chief Engineer, Roosevelt, Utah. The official advertisement will be found elsewhere in this issue. The Upper Blue Bench Irrigation District includes 8,400 acres of land, and is bonded for $150,000. Immediately to the South is the Blue Bench Irrigation District No. 1, embracing 7,300 acres bonded for $125,000, whose notice to contractors will probably be published in a few weeks, as Engineer Ed. F. Harmston (who is also engineer for the upper district) commenced the cross-section survey about March 10. The expected building this summer of the Moffat railroad into the Uintah basin on its way to Salt Lake Clty has set in motion the construction of many irrigation systems in Northeastern Utah. Directly across the Duchesne river from the two Blue Bench districts the West Bench Irrigation District has voted $50,000 bonds and plans to dig canal some time this summer, while 15 miles farther west the Fruitland Irrigation District, to irrigate over 20,000 acres, has been formed, and already has the survey of its 26 mile ditch nearly completed. Neighboring the Blue Bench on the southeast the South Myton Bench Irrigation District, bonded for $300,000, hopes to begin canal construction in April in conjunction with an adjoining Carey Act proposition of over 30,000, acres promoted by Frank H. Lott of Denver. The Uintah basin of 8,000 square miles, as yet unpierced by a railroad, included more than one-third of all the irrigable land in the State of Utah. To hasten the reclamation of several large areas Senator Smoot has pending in Congress a bill to extend the provisions of the Carey Act to all lands in the former Uintah Indian Reservation not homesteaded within five years from the opening to settlement of the reservation, August 28, 1905.

The Spokane, Wallace & Interstate R. R. Co. which received a franchise in Coeur d'Alene, Idaho, recently has about concluded the purchasing of the right of way between there and Wallace.

Advices from Sandpoint, Idaho, state that the necessary capital has been secured to assure the commencement of construction work this spring on the proposed Idaho & Swatiska Ry. from Lakeview to the Swatiska Mine, J. W. Ferguson, manager of the Swatiska mine is interested.

The construction of an electric railway from Naper, Neb., to Valentine, Neb., is being promoted by Mr. Carnell of Valentine. Arrangements are said to have been made with Eastern capitalists to finance the project.

At a meeting recently held in Buffalo, Wyo., a bonus of $35,000 was raised to assist the construction of the proposed railroad from Clearmont to Buffalo. The Wyoming Construction Co. will have charge of the work and will commence work about April 1.

The Sioux Falls & Western Ry. has been incorporated with a capital stock of $1,000,000 and proposes the construction of a line from Sioux Falls to Wheeler, S. Dak., a distance of 126 miles.

Reports from the vicinity of Wallace, Idaho, are to the effect that surveyors running a line from Pine Creek to Wallace are making preliminary surveys for the proposed line connecting Wallace with the Chicago, Milwaukee & St. Paul Ry., at St. Maries.

Town Council of Harrison has granted the Hyatt Roller Bearing Co., of Harrison, N. J. permission to construct a railroad spur from the Center street branch of the Pennsylvania R. R., across the New Jersey Railroad avenue, to their factory.

Surveys for the projected railroad from Tonopah Junction, Nev., to Mona Lake, Nev., have been completed. The road will be constructed for the Tonopah & Goldfield R. R., of which F. T. Armistead, Tonopah, Nev., is engineer.

The Chicago, Milwaukee & St. Paul Ry. is said to be planning to purchase the Rapid City, Black Hills & Western R. R., which has 34 miles of line extending from Rapid City, S. D., to Mystic.

It is reported that a contract has been let for the grading of 45 miles of the projected railroad from Goldfield north to Ely, Nev. The line has already been located from Goldfield to Tybo and a new survey will be made from Tybo through Hamilton, Cherry Creek and Deep Creek into Salt Lake.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oakland Traction Co., W. F. Kelly general manager, Oakland, has announced that as soon as the city council establishes the grades in the northern section of the annexed district, the company will extend its lines to give the residents of that section street railway facilities.

The Los Angeles Dock & Terminal Co. is to extend the east jetty at Long Beach in the harbor 300 ft. further into the ocean, in order to make the east jetty conform in length with the west jetty. The Mercerau Construction Co. will do the work.

The city of Los Angeles will vote next month on the issuance of $6,500,000 of harbor improvement and power bonds. Of the $6,500,000 bond issue the city intends to spend $3,000,000 in improving both the outer and inner harbors. One million dollars is to be spent in the construction of the wharves and warehouses, and the acquisition of all necessary land, besides establishing connecting roadways in that portion of the inner harbor north of the turning basin. The sum of $2,000,000 will be spent on similar improvements to be made in that portion of the inner harbor and outer harbor south of the turning basin.

The Edward C. Cribb Construction Co., of Los Angeles, has been incorporated with a capital stock of $200,000, the incorporators being Stanley M. McKee, Edward C. Cribb, H. W. Reynolds, W. W. Butler and J. H. Smith.

The Bear Valley Mutual Water Co., H. H. Garstin, president, of San Bernardino, is planning to build a new dam this summer which will greatly increase the capacity of Bear Valley lake. The supplies will have to be taken into the valley by way of Victorville as the Santa Ana canyon road will not be in shape until late in the summer.

The Hauser Construction Co., Los Angeles, Cal., has been awarded the contract for constructing the Fullerton, Richfield cutoff for the Santa Fe. The cutoff will be about five miles long. The cutoff will be constructed under the name of the Fullerton-Richfield R. R. as mentioned in our last issue.

The Cabazon Land & Water Co., of San Francisco, has been organized with a capital stock of $128,000, and proposes to reclaim and improve a tract of land on the Southern Pacific at Cabazon, a few miles east of Banning. George C. Boardman, and George W. Spencer, San Francisco, are interested.

The Southern Pacific Ry. Co. has started work building a second track on its Sierra Nevada Mountain District from Sacramento, Cal., east to Colfax. The work which will involve an expenditure of several hundred thousand dollars includes double-tracking in both directions from Truckee and Reno. William Hood is chief engineer, San Francisco, Cal.

Engineers of the Western Pacific Ry. Co. are going over the proposed site of the big railroad shops to be erected at Sacramento, Cal. The plant is to cost about $750,000 and is to handle all repairs, rebuilding and overhauling for the division west of Salt Lake. C. H. Ketcham, Sacramento, Cal., is division superintendent.

The San Diego, El Cajon & Escondido Ry. Co. is stated to have ordered the necessary materials for the construction of its projected electric railway from San Diego to Escondido. Engineers are shortly to make final surveys in Escondido preliminary to beginning grading work.

The Southern Pacific Co. has a crew of 250 men at work on the electrizing of its system in Alameda and it is expected to have electric cars in operation there by July 1.

Work on the turning basin in the Long Beach harbor at Long Beach has been started under the direction of Cady Markley, superintendent of the dredging operations for the Western Marine Navigation Co. About 400,000 cu. yards of dirt will have to be dredged.

The Southern Pacific Ry. is to expend about $500,000 in repairs to tunnel No. 10, near San Luis Obispo. The work will include lining the tunnel throughout its entire length with reinforced concrete.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Denver, Laramie & Northwestern R. R. Co. has filed its incorporation papers with the secretary of state. The capitalization is given as $30,000,000. The company is a Wyoming corporation and the filing of its papers in Colorado gives it a right to do business in that state.

C. S. Barnes, Monte Vista, is promoting a project for the establishment of a reservoir 33 miles northwest of Antonito on the Conejos River. The project proposes the use of the water for power purposes as well as for irrigation.

Plats for the Brookcliff Reservoir & Ditch Co. have been filed at Grand Junction by J. F. Hartley, of Denver. The company will irrigate 640 acres of fruit land on Red Mesa, several miles northwest of Grand Junction. The dam will be 70 ft. high and the reservoir will impound 34,344,000 cu. ft. of water.

Atchison & Daly, Fort Morgan, began work March 10 on their contract for constructing the San Arroya reservoir. The irrigation system will water about 15,000 acres. The dam will require 15 cars of steel and cement.

The Granada and Holly Irrigation District will issue $250,000 of bonds to build its proposed irrigation system, water for which will be taken from the Picket Wire river, the Arkansas and Rule creek. The storage reservoir will be located on Rule creek and will have a storage capacity of 33,000 acre feet. Contracts will be let by the board of directors within 60 days and actual construction work will commence within 90 days. W. A. Menil, Lamar, S. G. Higbee, Carlton, and W. J. House, Holly, are the directors of the district.

Construction work will probably be started in July on the Stone Prairie reservoir projects and also on the hydro-electric developments on the Poudre river near Fort Collins. Plats for the reservoir project were filed on Jan. 24, 1909, with the state engineers at Denver. The reservoir sites filed on in the Poudre canon provide a total capacity of 11,212,063,146 cu. ft. They are known as the Stove Prairie, Elkhorn and Roosevelt reservoirs. The project is backed by the Moffatts, the Cheesman estate and William G. Evans of Denver. George B. McFadden, Denver, is engineer.

The Union Pacific has secured the right of way for its Fort Collins branch from that city to the Weld county line, and has opened engineering offices in the Stover Drug Store at Fort Collins for the building of the branch.

Promoters of the Pueblo & San Luis Valley Ry., are looking over the proposed route of the line. A. B. Hulit, Pueblo, Colo., is interested.

Harry House, of Pueblo, has filed maps at Aspen for the reservoir site of the Colorado Power Co., on the Roaring Fork. It will be 350 feet wide, 100 feet long, will back up the water for three-quarters of a mile, and contain 34,000,000 cu. ft. of water, which will be used for power and irrigating. The total cost will be $250,000.

Kenefick, Quigley & Russell, Denver Colo., and Kansas City, Mo., have been awarded the contract at $12,987,000 for the construction of their irrigation system of the Colorado Southern Irrigation Co. and the Canon City, Florence and Pueblo Water Co. The project is one of the biggest irrigation enterprises ever attempted and the contract calls for its completion by April 1, 1912. Active work will be commenced within 60 days and 3,000 men will be employed in constructing the twelve reservoirs, 160 miles of main canals and 30 miles of diversion canals. The largest reservoir will have a dam of 197 feet high. The system will extend from Salida through the Wet mountain valley within a few miles of Pueblo.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Rome Railway & Light Co. of Rome, Ga., will at once begin work on a 900-ft. extension of its tracks in north Rome. The tracks will be extended from the present terminus at the north Rome depot of the Southern to the Southern Cooperative foundry.

It is stated here in Macon that work will be begun within the next 60 days on the Macon-Atlanta-Albany interurban trolley line, a charter for which was granted several months ago. Macon capital is said to own a majority of the stock. The material, it is stated, has been purchased for the construction of the line from Macon to Atlanta, a distance of 87 miles. The line will be completed within 12 months. The line to Albany from Macon will be 100 miles in length.

Powell & Sneed of Vidalia are projecting the construction of an eight mile interurban line from Vidalia to Gillis Spring in Emanuel county. Electric power for the road will be secured from the Penhoopee River, which has a good fall at the Gillis Spring end of the lines, and power will be furnished to plants in Vidalia from the power plant of the road.

The Augusta Railway & Electric Co. of Augusta is contemplating belting the Durpin Hill line with the Monte Sano line.

The construction of a railroad from Irwinville to Ashburn is proposed and W. A. Shingler, president of the Board of Trade of Ashburn, has appointed a committee to take steps to secure the construction of the road. It is proposed to later extend the line west to Albany or Americus.

James White, owner of the Star Thread Mills at Athens, has formed the James White Power Co. and will expend $250,000 or more for the construction of a hydro-electric plant at Barnett Shoals. About 4,000 h. p. will be developed and transmitted by electricity for manufacturing and lighting.

Work has been started on broad gaging the Lawrenceville Branch R. R., a 10 mile line running from Lawrenceville to Suwanee, where connection is made with the Atlanta-Charlotte line of the Southern Ry. J. R. McKelvey, Lawrenceville, is general manager.

Grading has been started at Fitzgerald for the Fitzgerald & Ocilla Electric Ry. and it is said will be pushed to early completion. The enterprise includes a complete street railway system in Fitzgerald, a suburban line to the A., B. & A. shops, besides a line to Ocilla. Two ship loads of rails have arrived at Savannah, while large quantities of ties have been contracted for locally.

The permanent organization of the Jacksonville & Atlanta Short Line Ry. Co., was effected at Fitzgerald, on March 10. This road projects a trunk line from Atlanta to Jackville, Fla., and for that purpose will absorb a number of short lines along the route. At a recent meeting the following temporary officers were elected: Col. J. E. Mercer, president, Fitzgerald, Ga.; B. B. Gray, first vice president, Pinebloom, Ga.; T. B. Ragan, second vice president, Hawkinsville, Ga.; T. W. Garbutt, third vice president, Fitzgerald, Ga.; Dr. J. C. Luke, fourth vice president, Ocilla, Ga.; Dr. C. A. Holtzendorf, treasurer, Fitzgerald, Ga.; W. A. Heller, secretary, New York; J. W. King, assistant secretary, Rochelle, Ga.; H. B. Coates, assistant secretary, Hawkinsville, Ga.; R. G. Dickerson, assistant secretary, Emmerville, Ga. The road, if con-

structed, will be 40 miles shorter than present routes, and will require much construction work.

The Albany & Northern Ry. has been formally transferred to the Georgia Southwestern & Gulf Ry. The latter road is planning to build a line southward from Albany to St. Andrews Bay on the Gulf of Mexico.

Advices from Jackson state that Capt. W. F. Smith and associates in connection with the building of the Middle Georgia Interurban Railway Co. from Griffin through Indian Spring and Jackson to Social Circle, will build a power plant at Smith's mills, on the Ocmulgee river, about four miles below the site of the Central Georgia Power company's plant.

The Albany Power & Manufacturing Co., of Albany, Louis Jverissen, general manager, will expend $50,000 for an auxiliary steam plant.

The Southern Ry., W. H. Wells, engineer of construction, Washington, D. C., has placed an order with the Tennessee Coal & Iron Co. for 30,000 tons of 85-pound steel, to be delivered from its Birmingham plant between June 1 and December 1, 1910, at the rate of 5,000 tons per month. The rails will be used in the work of improving and double-tracking the main stem between Washington and Atlanta. A large part will be used in replacing steel now in the track, which will, in turn, be used to better the tracks of some of the secondary lines.

The Savannah, Augusta & Northern R. R. which has 25 miles of line in operation, is planning to build an extension through to Gainesville. E. M. Rice, Statesboro, Ga., is general manager.

The Atlantic & West Point R. R. has an amended petition before the State Railroad Commission, asking for authority to increase its bond issue by $1,286,000. It is stated that the increased issue will be for the purpose of taking up outstanding debentures of that amount against the railroad.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Contracts have been let at Beecher for digging the Exline Creek drainage ditch. William Brown, Crown Point, Ind., secured the contract at 5.48 cts. per cubic yard. The creek runs through Will and Summer townships and is 8½ miles long. The width is from 10 to 12 ft. bottom and 25 ft. from bank to bank. Work will begin as soon as possible.

It is now said that the Burns Construction Co., Isabella Bldg., Chicago, Ill., will commence work in April on the construction of the projected line of the Northern Illinois Electric Ry. Co. The charter of the railway has been amended to permit of extending the road from Steward to DeKalb and Aurora and southwest from Amboy to Princeton, Kewanee, Rock Island and Peoria.

The Elgin-Belvidere Traction Co., according to an announcement of its president, J. Hamilton Browne, will soon have a new line in operation from Marengo north that will connect with a line to Elkhorn, Wis. Later a line will be constructed that will connect Aurora and northern Illinois with Milwaukee and the lakes and summer resorts of northern Illinois and southern Wisconsin.

The Peoria Ry. Terminal Co., E. A. Burrill, general manager, Peoria, has begun work on the preparation of plans for new terminal yards in South Bartonville, Peoria, which will contain between 25 and 30 miles of track, and will afford storage capacity for from 3,000 to 3,500 cars. In addition to building the yards the Terminal Co. will also construct yard offices, superintendent's offices, water tanks, coal chutes, round houses and other necessary buildings.

The S. & H. R. Robinson & Son Constructing Co., of St. Louis, Mo., and Thebes, has begun work on its contract for grading on the Cairo & Thebes R. R. The company has about 80 teams at work on the contract, which amounts to about $100,000. Work on the embankment begins at Thebes and will connect with the work already completed southeast of there. There is to be a deep cut made near Thebes, said to be about 63 ft. Contractor Wolf will in a few days begin grading on the road near Fayville, about three miles from Thebes.

Robert Grace, 830 Schofield Bldg., Cleveland, O., has been awarded the contract for the excavation work for the new yards of the Baltimore & Ohio R. R., to be constructed at Chicago Junction. The yards will have a capacity of 4,000 cars and will contain nearly 65 miles of track. The Grace contract is said to amount to $1,500,000 and will take six months to complete. Mr. Grace has already started work with three steam shovels, six locomotives, about 100 cars and about 250 men.

The Chicago, Burlington & Quincy Ry., T. E. Calvert, chief engineer, Chicago, will have work started early in the spring on double tracking between St. Paul and Savanna, Ill. All reverse curves and unnecessary trackage will be eliminated.

The Chicago & Alton Ry. and the Santa Fe have decided to start work at once on filling in along the right of way at Joliet, Ill., for track elevation in that city. As soon as the frost is out of the ground other steps will be taken toward the completion of the work.

The Eastern Illinois Ry. Co. has been incorporated with a capital stock of $1,000,000 and headquarters at Chicago and proposes to construct a road from West Hammond by way of Harvey to Riverside, all in Cook county. The incorporators and first board of directors are Willbur E. Snyder, Warner H. Robinson, Edgar H. Fank, and Sam Blumenthal, all of Chicago, and John Cox, of Joliet.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is stated here in Gary that if the Gary & Interurban continues to refuse to make terms and refuses to extend its tracks to the river so that the Gary & Southern cars can enter the city over the tracks, the latter railway will ask for a franchise across the river to 25th Ave. and north on Washington St. to the northern limits of the city.

Announcement has been made that the Evansville Ry. Co. of Evansville will begin at once the work of building its extension from Rockport to Grandview. Later the road will be built to Cannelton and Tell City, and it is hoped to eventually build to Louisville.

A movement has been started at Washington by local business men to form a company for the purpose of constructing a new line through the town.

It is proposed to extend the Muncie & Portland traction line to Celina, O., from Portland, passing through Fort Recovery.

Morton S. Hawkins, Indianapolis, has applied to the Board of Public Works of that city for the right to occupy Le Grande Ave. with the tracks of the Beech Grove Traction Co., which is to build a line from Indianapolis to the suburbs.

The Wabash R. R. has broken ground at Fort Wayne for the preliminary work for track elevation.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Monticello has been petitioned to call a special election for the purpose of voting upon a 5 per cent tax in aid of the Manchester & Davenport interurban railway. A contract for constructing the first 30 miles of the line has already been let. Lafe Matthews of Manchester, Father M. C. Murphy of Argand, J. A. Voorhees of Monticello and W. T. Baker of Davenport are the promoters. The road is to begin at Manchester and end at Davenport and be constructed either by way of Tipton or Bennett.

The Centerville Light & Traction Co. of Centerville has been incorporated under the laws of the state of Maine with a capital stock of $500,000, the incorporators being M. W. Baldwin, H. E. Mason, J. R. Griffith, J. J. Herman and A. S. Conant.

The Iowa & Illinois Railway Terminal Co. of Clinton has been organized with a capital stock of $25,000. F. W. Ellis is president and P. P. Crafts is secretary.

The Chicago, Milwaukee & St. Paul Ry. is said to be contemplating constructing a 22-mile loop connecting Dubuque, Ia., and Shullsburg, thus making a direct route from Janesville, Wis., to Kansas City.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Orders for 14 miles of rails have been placed by the Wichita Street Ry. Co. of Wichita for track reconstruction purposes. The steel will be shipped about March 15. Most of the steel will be used to replace the present tracks, but there will also be about 1½ miles of new track laid.

The Oklahoma & Kansas Ry. Co., which projects an electric railway between Hattonville, Okla., and Galena, Kan., a distance of 23 miles, has preliminary arangements well under way. Arrangements have already been made with the Baxter Light & Power Co. at Baxter Springs for operating the six cars which will be used when the road is completed. Mayor Charles Jones of Baxter Springs and John M. Cooper of Baxter Springs are directors of the traction company.

Petitions have been circulated in Wichita asking the mayor and city commissioners to call an election for the purpose of voting $30,000 of terminal bonds for the Arkansas Valley Interurban Ry. Surveys for the road were made some time ago and the company will soon be ready to begin the work of building its line between Wichita, Hutchinson and intermediate points. Practically all preliminary work has been accomplished, such as securing right of way, etc.

D. Siggins of Independence, owner of the interurban line recently placed in operation between Cherryvale and Independence, is to apply for franchises for a street car line in the latter city. It is also probable that the interurban line will be extended on to Columbus.

The Jennings Construction Co. has started work at a point midway between Valley Center and Wichita on the projected line of the Arkansas Valley Interurban Ry. It is expected that cars will be running over the first ten mile stretch between Wichita and Valley Center by July 1. All of the material for the line except the cars has been ordered and a part of it is now here. The interurban will parallel the Santa Fe most of the distance north from Wichita to Valley Center. The ultimate terminus of the road will be Hutchinson and it will pass through Sedgwick, Halstead and Burrton. This same company has secured the right of way for an interurban line south from Wichita, going down the west side of the Arkansas valley, through Oxford to Arkansas City. This part of the road will not be built until the line north is completed.

Theodore Lutguerding, Wichita, has been awarded the contract for constructing the Wichita, Kinsley, Scott City & Denver Air Line Ry. Mr. Lutguerding has organized the Air Line Construction Co. and, according to the contract, will begin to grade for the new road May 1. The first actual work will begin at Turon and will progress east toward Wichita and west toward Kinsley. This portion of the line will be completed first, although the Air Line Construction Co. was given the contract for the entire road from Wichita to Denver, a distance of 500 miles. W. F. Brown, Naron, is president of the railway.

A mass meeting was held recently at Clay Center by residents of Abilene, Washington and Industry to make preliminary arrangements for an electrical interurban railroad through that section. A preliminary organization was perfected. The plan is to build an electric line from Beatrice or Fairbury, Neb., down through Washington, Clay Center, Industry, Abilene, Newton and to Wichita.

The St. Joseph & Grand Island Ry., W. A. Parker, chief engineer, St. Joseph, Mo., is shortly to let contracts for bettering its roadbed between Marysville and Garden. Several contractors were over the work recently.

The Mexican, Oaxaca & Yucatan R. R. Co. has filed articles of incorporation with a capi-

tal stock of $1,000,000, with general offices at Omaha, Neb., Joplin, Mo., and Topeka, Kan. The company proposes the construction of a line from Omaha, Neb., through Nebraska by way of Douglas, Sarpy, Cass, Otoe, Johnson and Pawnee counties, thence through Kansas, Missouri and western Arkansas, the system being 1,314 miles in length.

Voters of Cheyenne county, Kan., are soon to vote on a proposition to issue bonds for the purpose of raising money to secure the construction of the Gulf & Northern line through that county. St. Francis, Kan., is the county seat.

The Missouri Pacific Ry. Co. is said to have completed all financial arrangements preparatory to following the plans laid for the construction of the cutoff from Sterling, Kan., on the Hutchinson-Geneseo line to Great Bend, the terminus of the Hutchinson line. The line will be 33 miles in length and would change the route from St. Louis to Colorado, which is by way of Osawatomie, Council Grove and Salina, to that by way of Fort Scott, Yates Center, Wichita and Hutchinson, thus shortening the distance and running time and traversing a more thickly populated country. E. F. Mitchell, St. Louis, Mo., is engineer of construction.

The Western Kansas, Gulf & Northern Ry. Co. of Goodland, Kans., has applied to the State Board of Railroad Commissioners for the right to issue stock and bonds for the construction of the line. The road will run from Oklahoma City Okla., through the western tier of Kansas counties to Northern Colorado. It will be the first north and south line to traverse Kansas and will pass through three Kansas counties without railroads. Every county through which the road passes with the exception of one has voted bonds for it, the bonds thus voted amounting to $695,000. The company asks permission to issue $20,000 in stocks and $20,000 in bonds per mile, the bond and stock only to be issued as work proceeds. Construction is expected to begin next April.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Grand Trunk R. R. has applied to the city council of Bay City for a franchise in Saginaw St. The company plans to construct an east side terminal in the city, which will involve the expenditure of $1,000,000, it is said, and will require the construction of a long bridge over the Saginaw River.

Alderman Charles E. Fish of Petoskey is advocating the construction of a municipal dock.

Surveys have been under way for some time for the proposed Detroit, Lansing and Grand Rapids interurban line and it is expected that plans will be ready shortly for submission to the capitalists who are to finance the road. Of the 53 councils controlling the territory through which the road will pass, 45 have agreed to submit the question of granting franchise rights either March 14, when the village elections will be held, or April 4, when the cities and townships will vote. Former State Senator Andrew Fyfe of Grand Rapids and Dr. Oliver H. Lau and H. M. Wallace of Detroit are the promoters.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The American Bridge Co. has been awarded the contract for furnishing the steel for the new steel ore dock to be constructed at Allouez for the Great Northern Ry. Bids for the construction contracts have already been received. About 3,000,000 ft. of lumber will be required for the cribbing alone and there will be about 25,000 cu. ft. of concrete work. A total of 12,000 piles will be required in putting in this concrete foundation for the heavy superstructure and over 60,000 cu. yds. of gravel filling will be used for sinking the cribbing. A. H. Hogeland, St. Paul, Minn., is chief engineer, Great Northern Ry.

The Interstate Dredge & Dock Co. of Duluth has been awarded the contract for building the cribbing for the 360,000 sq. ft. of floor space to be added to No. 1 dock of the Northwestern Fuel Co. at Duluth. The contract for the dredging in connection with the addition was let to the Great Lakes Dredge & Dock Co. of Duluth. About 200,000 yds. of material must be moved. The Interstate Dredge & Dock Co. contract calls for furnishing and placing 1,200 ft. of cribbing, to inclose the two 600-ft. sides of the corner of the dock site not already occupied. The cribbing on the slip side will be 20 ft. wide by 33 ft. deep and on the channel side 18 ft. wide and 29 ft. deep.

The Walsh Construction Co., Davenport, Ia., has eight miles of grading for the Soo and is preparing to begin work. The work extends from Withrow to the St. Croix river, a mile north of the present Wisconsin Central bridge and four miles from Stillwater.

The Ambursen Hydraulic Construction Co. of Boston, Mass., has begun preliminary work on the construction of the dam at Rapidan for the Consumers Power Co. The dam is to be of reinforced concrete and will be 60 ft. high. Work is to be completed by Dec. 1. J. M. Smith is superintendent of construction.

The Minnesota River Improvement & Power Co. of St. Paul has filed its articles of incorporation in the office of the register of deeds of Ramsey county. The company has a capital stock of $1,000,000 and was formed for the improvement of navigation of the Minnesota River, its tributaries and Big Stone and Traverse lakes, for the development and improvement of the water powers of these streams and lakes for public use, and for the reclamation and cultivation of the low, marshy and swampy lands bordering on these waters. The incorporators include E. S. Warner, St. Paul; William F. Nelson and Loren W. Collins, Minneapolis, and William H. Gold, Redwood Falls.

The Great Northern Ry. is, it is said, seriously considering the construction of a branch line from the Mississippi in Aitkin county, Minn., through Aitkin, Mille Lacs, Kanabec and part of Isanti counties to a connection with its line at Mora. As projected the line will be about 80 miles in length. J. C. Patterson, St. Paul, Minn., is assistant chief engineer of the Great Northern Ry. Co.

The Northern Pacific Ry. is planning extensive improvements to its terminal facilities at Minneapolis. It is said that the capacity of the existing yards in Northeast Minneapolis will be more than doubled and that new yards will be established in South Minneapolis.

Duluth and the Ranges.

BY PETER E. MEAGHER.

Andrew Perrin of the contracting firm of Carl Hall & Co. came in to see us the other day. He just returned from a month's visit to Southern California. He had a very enjoyable trip out there, and the way he described some of the pleasures he had, we got the idea that he was trying to make us envious because we were not so fortunate as to be there to participate in all of the good things he told us about. His firm has just been awarded a contract by the Duluth & Iron Range Ry. Co. to construct a spur track about 7 miles long into one of the iron mines near Ely, Minn. They will start on the same at once.

The Roberts-Kingston Contracting Co. of Duluth has already started on their new contract of iron mine stripping that they were awarded recently on the Mesaba Range.

The Winston-Dear Co. has already started on their 6,000,000 yard contract of stripping the Buffalo & Susquehanna Mine near Hibbing, Minn. They are going to start this job temporarily with a narrow gauge outfit, and just as soon as they can purchase a standard gauge plant, will start the same on this work.

Denis Madden, general superintendent, and C. E. Sloan, chief engineer, for the MacArthur Brothers Co., were visitors at this office a few days ago. They were accompanied by Arthur Mitchell, an old friend of the writer, who has been appointed general superintendent, in charge of MacArthur Brothers Co.'s operations in the northwest. They have, at the present time, two large stripping operations on the Mesaba Range, and are working night and day shifts on both of them.

The Interstate Dredge & Dock Co. of Duluth was awarded a large timber contract for the erection of a new coal dock at Superior, Wis., and have already started to work on the same.

J. A. Higgins, railroad contractor, was a caller at this office recently. He has at present, about 300 men working on the Thief River Falls branch of the Soo Line, a contract he subbed from Foley, Welch & Stewart.

C. E. Jamieson, contractor on the Soo line, was a caller at this office. He has about 15 miles of work under way at the present time.

O. A. Lewellen, general agent for the northwest for the J. I. Case Machine Co., was a visitor with us a couple of days this week. He reported that their business was opening up very fine, and was far ahead of what it was this time last year.

John R. Davis, contractor, was a caller a few days ago. He is not doing anything at the present time, but is looking for a contract to get busy on the coming season.

John Runquist, the Duluth railroad contractor, has got a great many men working at the present time, and has about 8 different jobs under way for the Duluth & Iron Range railway, the Duluth, Mesabe Northern, and Great Northern Railways.

C. J. A. Morris of Morris & Shepard, was a caller here the other day. He reported nothing new at the present time.

Robert Patterson, well known to the contractors in this section of the country, was recently appointed president of the Board of Public Works of the city of Duluth.

Patrick McDonnell, the Duluth contractor, is at the present time in Grand Forks, N. Dak. He is figuring on a very large paving job, and, from last reports, we understand that the probabilities are, he will be awarded the same.

The Drake & Stratton Co., Hibbing, Minn., was awarded a large stripping contract by the Oliver Iron Mining Co. last week to strip the Dale-Uno Mine. I do not know the exact yardage in this job, but know that it is at least a couple of million yards.

Peter E. Meagher's Employment and Labor Offices and Warehouses, are at the present time in the hands of the carpenters and painters, and being enlarged considerably, and improvements are being made. We extend invitations to all of our old friends, and to those interested in the contracting line, to pay us a visit and inspect our new quarters. We will be ready for business March 15.

At present in Duluth and vicinity, there are quite a few laboring men idle, but not from choice. There is a great deal of work going on now, and more opening up every day. The surplus of laborers is caused by a great many of the logging camps closing down on account of the soft weather, and the men returning from them all have money, and the majority of them will not go to work until they have the same spent.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Track construction work was started at Mexico, Mo., on March 3 on the projected line of the Mexico, Santa Fe & Perry Traction Co. The line will be 40 miles long and is expected to be in operation from Santa Fe to Hereford in eight months. Later the road will be extended to Hannibal and to Fulton and Columbia. The Burns Construction Co., Isabella Bldg., Chicago, Ill., has the contract.

The Commercial Club of Unionville has taken up the matter of securing the extension of the interurban railway from Kirksville to that city and possibly north to Seymour.

The directors of the Manufacturers Ry. Co. of St. Louis have voted to increase the capital stock from $250,000 to $5,000,000 and to issue $5,000,000 in bonds. The line is 21 miles long. J. J. Baulch, St. Louis, Mo., is superintendent.

Business men of Bethel, Mo., have completed arrangements for the construction of

an extension of the Shelby County railroad from Shelbyville, Mo., to Bethel. L. B. Houck, Shelbina, Mo., is president of the railroad.

Farmers along the proposed route from Columbia to Jefferson City, Mo., have signed up for the right of way for the proposed North Missouri Central Ry. Co. Contracts for the necessary ties are now being let and as soon as bonds are sold construction work will start in earnest.

Practically 75 per cent of the necessary capital is reported to have been received for the projected new railroad from St. Louis to Fort Smith, Ark. The road will be known as the St. Louis & Pacific, and is being projected by Joseph Ramsey, Jr., formerly president of the Wabash, and Malcolm Niven, of New York City. The new road will be 310 miles in length, with as low a maximum grade as one-half or one per cent and a maximum curvature of 5 per cent. The cost of the enterprise is estimated at $75,000 a mile.

St. Louis Items.

BY A. B. KOENIG.

The L. J. Smith Construction Co. of Kansas City has started work on the Santa Fe R. R. near Winslow, Ariz. Scott Mitchell, vice president of the company, is going to be in charge of this. They have also started several more camps on the Missouri Pacific R. R.

The construction of a new southwestern trunk line with independent terminals at St. Louis is assured, and the project will be realized by Jos. Ramsey, Jr., former president of the Wabash, or by the Manufacturers' Railway., George F. Moore, president. Malcom Niven of New York is associated with Mr. Ramsey in exploiting the St. Louis & Pacific, which will be built from St. Louis to Fort Smith, Ark. The new road will be 310 miles long, with as low a maximum grade as one-half of 1 per cent, and a maximum curvature of 5 per cent. The cost of the enterprise is estimated at $70,000 a mile, and Mr. Niven says that more than 75 per cent of the necessary capital has been obtained. The line will entail an investment of approximately $21,000,000. This undertaking of Mr. Ramsey's is in addition to that of the Manufacturers' Railway. If Mr. Ramsey decided to carry out his project, the Manufacturers' Railway will cooperate with him, but should Mr. Ramsey conclude, for any reason, not to go ahead, then the Manufacturers' Railway will provide the contemplated line. The St. Louis & Pacific proposes entering St. Louis over the rails of the Manufacturers' Railway and using this company's terminal facilities. Mr. Moore also announced that one important railroad in the southwest has signified its willingness to enter into an arrangement with the Manufacturers' Railway to form a new southwestern line. The Manufacturers' Railway is determined to establish a new route from St. Louis to the southwest. The Manufacturers' Railway recently increased the capital stock from $250,000 to $5,000,000 and authorized an issue of $5,000,000 of bonds. Although the Manufacturers' Railway has had a capital of only $250,000, it has approximately $1,500,000 invested. This amount is represented by notes to Adolphus Busch and the St. Louis Union Trust Co. About $500,000 of land has been purchased by Mr. Busch and it probably will be transferred to the railway. The company has a large tract in St. Louis county at the southwestern city limits for immense yards, terminal yards in the vicinity of the Anheuser-Busch Brewing Association, and adequate area for yard purposes on the Illinois shore immediately opposite the brewery. It also has land along its right of way in St. Louis for factory and warehouse purposes. Through the issuance of stock the company will have $3,250,000 and through the bond sale approximately $5,000,000, or a total of about $8,250,000, for developing the property. Aug. A. Busch was re-elected chairman of the board, George F. Moore president, Adolphus Busch vice president and Otto H. Rassfeld secretary and treasurer. The officers and E. A. Faust, George F. Meyer and W. D. Orthwein constitute the board. Negotiations are pending between the Manufacturers' Railway and the St. Louis & Illinois Belt, controlled by Donk Bros. Coal and Coke Co., looking to a merger. It is considered probable that this east side line will unite with the Manufacturers'. Through an arrangement with the St. Louis & Illinois Belt the Manufacturers' Railway will establish a belt line from Alton to its yards south of East St. Louis.

The Cooney Construction Co. of St. Louis, Mo., and Fort Smith, Ark., got in on an $80,000 paving contract at Oklahoma City, Okla. This is not the only good thing that happened last week. R. E. Cooney, general manager of this company, when he returned home from Oklahoma City, found a big, bouncing boy there to greet him. The new arrival came Sunday night.

The St. Louis & San Francisco is perfecting a financial scheme to cover the Colorado Southern, New Orleans & Pacific and allied lines and the St. Louis, Brownsville & Mexico, and the progress of the adjustment is such as to warrant an official announcement from the company's fiscal agents in a few days. The transaction will approximate $30,000,000. The St. Louis, Brownsville & Mexico was acquired recently by the Frisco from the St. Louis syndicate which constructed and operated it, and the members of the syndicate became powerful factors in the group which obtained control of the Frisco. It runs from Houston to Brownsville on the Rio Grande, paralleling the gulf coast. The Colorado Southern, New Orleans & Pacific was built by the Frisco and always was part of the system. It extends from New Orleans to Houston and with the Brownsville line forms a gull coast route from New Orleans to the Mexican boundary at Brownsville. The St. Louis, Brownsville & Mexico and the Colorado Southern, New Orleans & Pacific will become part of the Frisco system proper and they will constitute the New Orleans, Texas and Mexico division. The bonds of these properties will be guaranteed by the Frisco. Negotiations are pending with the Mexican government and the National Railways of Mexico for the construction of a new line, paralleling the coast of the gulf of Mexico, from Matamoras, opposite Brownsville, to Tampico and Mexico City. The road will be constructed either by the National Railways of Mexico or the Frisco, or by the Frisco and the Mexican government, or by the National Railways of Mexico and the Frisco. The undeveloped territory in Mexico along the projected line will be opened to settlement and cultivation. With the Matamoras-Tampico line completed, there will be a continuous gulf coast route from New Orleans via Houston and Brownsville to Tampico. By the Brownsville route the distance from St. Louis to Mexico City will be reduced about 200 miles. Through trains will be operated from New Orleans to Brownsville, carrying through cars from St. Louis and other cities, and ultimately through trains will be run from New Orleans to Mexico City via Brownsville. Plans are being made already for double tracking part of the Brownsville line.

R. M. Quigley of the Kenefick-Quigley-Hoffman Construction Co., 229 Century Bldg., Denver, Colo., stopped off here for a couple of days on his way west. The Kenefick-Quigley-Hoffman Construction Co. just landed an $8,000,000 irrigation job near Canyon City, Colo. It has 6,000,000 yards of rock, 12,000,000 yards of earth, 2½ miles of tunnels and 250,000 yards of concrete work to sublet on this work. Will open an office in Canyon City next week, where profiles can be seen and all other information obtained.

M. C. Connors, 14 S. Canal St., Chicago, Ill., has 4,000 yards of bridge filling on the Burlington R. R. north of Barrow, Ill., to sublet. This work is suitable for a 6 or 7 team wheeler outfit.

Mulville Bros., Alton, Ill., have 200,000 yards of team work in quantities to suit outfit to sublet. Free transportation over the C. & A. R. R.

Labor is thinning out very fast here. Every road in the country has been putting on extra gang and section men in the past two weeks and there is a good demand for labor of all kinds in this neighborhood.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The construction of an electric railway through the Madison valley is under consideration and P. A. Morrison of McAllister, Mont., is securing tonnage data for submission to eastern capitalists.

Boynton, Church & McCoy, Billings, are making good progress with their contract for double tracking the Northern Pacific between Billings and Huntley, a distance of 10 miles, and it is believed that entire contract will be completed by June 1. The camps on this work are as follows: Camp No. 1 is the steam shovel camp and is operated by Boynton, Church & McCoy, the contractors. Their territory extends to a distance of about a half mile the other side of the Yellowstone river bridge. Camp No. 2 is next, operated by A. J. Sullivan. He has some six miles of track under a sub-contract. Camp No. 3 comes next, that of James Ryan, with a sub-contract of about 1½ miles. Camp No. 4, operated by Fred Johnson, who has about two miles of the road under a sub-contract.

The Big Horn Water, Light & Power Co. is being formed at Billings for the purpose of furnishing water, light and power to the towns of Byron, Cowley and Lovell in the Big Horn Basin. The plant will be established at Byron and it is probable that natural gas will be utilized by the company for fuel, as there is sufficient gas now obtainable in that field to supply the plant. The water will be obtained from large springs located at Byron. Norman S. Poole, Billings, is promoting the project.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Matters are shaping up so that it is now practically assured that the Public Service Commission will ask for bids for the construction of the Broadway-Lexington Ave. subway route at New York city by April 1, and that ground for the line will be broken about two months later. Construction work on the Broadway-Lafayette Ave. subway route in Brooklyn will be started about the same time.

The Schenectady Ry. Co. of Schenectady has applied to the Public Service Commission for permission to lay tracks on Edison Ave. in Schenectady.

The Mohawk Engineering & Construction Co. of Highland has been incorporated with a capital stock of $10,000 and will engage in a general contracting business, including construction of railways. The incorporators are Harry A. Sylvester, 132 Clinton St., Schenectady, N. Y.; Andrew W. Lent, 60 Second St., Newburgh, N. Y., and Harold A. Lent, Highland, Ulster Co., N. Y.

The Board of Estimate of New York city has voted to grant a franchise to the Manhattan Bridge Three-Cent Line, which desires to operate trolley cars between Desbrosses St. ferry, Manhattan, and the Fulton St. shopping district in Brooklyn.

The State Public Service Commission is considering the application of the Frontier & Western R. R. Co. for permission to build a line from the western end of the Buffalo Frontier Terminal R. R. to the International bridge.

A bill has been introduced in the state legislature of New Jersey for the appointment of a Hudson County, New Jersey, rapid transit commission, which shall have power to expend not more than $15,000,000 to build at the county's expense a subway from one end of the county to the other. The bill provides that if the Board of Freeholders adopts a resolution saying that rapid transit railways are necessary in any county of the first class that a rapid transit commission shall be created. The commission shall be appointed by a supreme court justice sitting in the special county. The commission is to consist of three members appointed by the court and the fourth shall be the director of the Board of Freeholders. The term of office is six years, with a salary of $10 a day for each day in which the commissioners actually work. A

chief engineer, who shall be appointed by the court, also is provided.

Articles of incorporation have been filed by the Schein Construction Co., Brooklyn, N. Y., with the state department. The company is capitalized with $5,000, consisting of $100 shares. The first board of directors are Louis P. Schein, Isidor Meyer and Charles V. Lewis, Brooklyn, N. Y.

The Catskill Traction Co. of Catskill, which succeeded to the property and franchises of the Catskill Electric railroad, sold at foreclosure on January 12, has applied to the State Public Service Commission, asking for consent to mortgage its property and franchise securing a bond issue to the amount of $200,000, and for permission to issue presently $60,000 in bonds in part payment of the purchase price of the property of the Catskill Electric railroad, also for leave to issue $12,000 capital stock to the incorporators, which has been paid for in cash, and $48,000 par value capital stock to W. C. Wood in payment of the balance of the purchase price of the Catskill Electric railroad property.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chesapeake & Ohio Ry., H. Pierce, engineer of construction, Richmond, Va., is said to be about to award contracts for double tracking its line from South Portsmouth to Maysville, Ky., a distance of about 20 miles.

The commissioners of Marion county, Marion, have taken definite steps for having work started on the improvement of the Little Scioto River. The work will cost over $65,000 and will include widening and straightening the course of the river.

Estimates have been made showing that it will cost the city of Elyria $3,900 for ripraping the shore line at the water works pumping station to prevent erosion.

The stockholders of the proposed Cleveland, Norwalk, Van Wert and Indianapolis electric line will hold a meeting in Van Wert May 31, when the proposition of a construction company will be heard.

The Toledo Rail & Light Co., Toledo, will erect a new power house, to cost, with equipment, $300,000.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Eastern Oklahoma Traction Co. has been chartered with a capital stock of $100,000 and headquarters at Muskogee. The company proposes to build electric lines from Muskogee to Tulsa, 48 miles; a branch to Wagoner, 9 miles; from Wagoner to the Grand river, 10 miles; Tulsa to Sapulpa, 14 miles; Muskogee to Webber's Falls, 23 miles; Muskogee to Checotah, 21 miles; Muskogee to Okmulgee, 39 miles; Okmulgee to Oklahoma City, 87 miles. In all it is proposed to build 251 miles of line at an estimated cost of $26,000 per mile. The directors are H. B. Spaulding, R. N. Eggleston, J. W. Mattox, L. R. Kershaw, W. L. Tull, J. B. Furry and Guy Bowman, all of Muskogee. An auxiliary company, to be known as the Railway Construction Co., with $50,000 capital and headquarters at Muskogee, has also been chartered. The directors are R. N. Eggleston, W. R. Robison, L. R. Kershaw and J. B. Furry of Muskogee and W. P. Keegan of Tulsa.

J. B. Moore, Tahlequah, is promoting a project for an interurban line between Muskogee and Tahlequah.

J. W. Griesel, surveyor for Pawnee county, Pawnee, Okla., has completed the survey to the Osage county line for the Missouri, Golden City & Oklahoma railroad, which was chartered three years ago to build southwest from Jefferson City, Mo., through Carthage and Joplin to Bartlesville, and Pawhuska in Oklahoma.

The Choctaw Railway & Lighting Co. of McAlester has secured a franchise from the city council of Haileyville, which insures the construction of the interurban from McAlester to Haileyville, two of the most important towns in the Oklahoma coal belt.

The Oklahoma City & Panhandle Ry. Co. recently chartered to build westward from Oklahoma City across the Texas Panhandle, has elected the following officers and directors: A. Rey of Oklahoma City, president; Eugene S. Sullivan, Boston, vice president; H. E. Chapman, Altus, secretary; E. J. Dupree, Oklahoma City, treasurer. Directors: A. Key, Eugene S. Sullivan, H. E. Chapman, E. J. Dupree, T. R. Anderson, Oklahoma City. The estimated cost of the proposed line is $3,000,000.

R. W. Raymond, civil engineer of Philadelphia, has completed his investigation and will make his report to the banking interests he represents on the construction of the proposed Mid-Continent Traction Co. from Sapulpa to Tulsa. This is a link in the interurban system to connect the principal cities in the mid-continent oil and gas field.

The Enid, Ochiltree & Western Ry. Co., which already has a line under construction from towns in the Texas Panhandle east to Enid, has taken out an Oklahoma charter. The company proposes to build from Beaver City and from a point near the southeast corner of Beaver county to Enid and Oklahoma City, 500 miles, traversing Beaver, Harper, Ellis, Woodward, Dewey, Major, Woods, Alfalfa, Grand, Garfield, Kingfisher, Logan, Canadian and Oklahoma counties. The capital stock is $500,000 and the principal place of business at Enid. The directors are Benjamin H. Tallmadge, LeRoy W. Layons, William H. Greer, Hamlin Palmer, Ernest W. Waite, all of Enid.

It has been announced that the Oklahoma & Golden City Ry. Co. has secured financial aid and the construction of the proposed system is assured. The company was organized in July, 1907, and projected the construction of a line from Jefferson City, Mo., southwest to Fairview, Okla., a distance of 340 miles. As planned the line will pass through Eldon, Climax Springs, Preston, Pittsburg, Humansville, Stockton, Golden City, Carthage, Joplin, Mo., Miami, Centralia, Bartelville, Pawhuska, Fairfax, Enid, Okla., and branches from Climax Springs to Springfield and from Linn to Sylvania, making the total length of the system 425 miles. Edward Griesel and W. S. Hawkins, Muskogee, Okla., are interested in the work.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Albany & Interurban Ry. Co. recently incorporated by citizens of Albany, has asked a franchise for a city system. The company also proposes to build a number of interurban lines from Albany as a center.

The Hood Valley Electric R. R. has filed deeds for part of its right-of-way with the county clerk at Hood River. The plans include a complete system of transportation for the west side of the valley in addition to a main line into the Mount Hood country.

The Portland Railway, Light & Power Co. of Portland will lay double tracks from the intersection of East 28th street and Sandy road on the Sandy road to East 16th and East Davis street and East 10th to East Burnside, as soon as the city council authorizes the work.

The dam of the Prineville Flouring Mills on Crook River above Prineville was washed out for the second time this year as the result of floods, entailing a loss of more than $6,000.

The Gold Hill Railroad & Lumber Co. of Gold Hill has begun construction work on a railroad to extend from Gold Hill to the lime deposits four miles west and thence to the timber belt in the upper Foots creek country.

The Celilo Milling & Power Co. has purchased 80 acres of land from I. H. Taffe at Celilo Falls on the Columbia, and announcement has been made that a power plant will be installed this summer.

The Hurley-Mason Co., Portland, has been awarded the contract for all of the masonry work in connection with the regrading and double-tracking of the Northern Pacific from Tenino to Vancouver. The contract involves about 40,000 yards of concrete. The work consists of all of the masonry work from the small culverts up to the large bridges crossing the Lewis River, Kalama River, Cowlitz River, Toutle River and numerous smaller streams.

Southern Pacific surveyors are working on the new route for the line through the Big Elk Creek district, Oregon, which will shorten the distance between Corvallis and Yaquina by 12 miles and also reduce the grade to 1 per cent.

Surveys are now being made by the Oregon Railway and Navigation Co. engineers for the construction of the yards at Hood River, Ore. The work will also include the construction of a $25,000 station. G. W. Boschke, Portland, Ore., is chief engineer of the company.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fairmont & Pittsburg Ry. Co. of Fairmont, W. Va., has been chartered with a capital stock of $1,000,000 and proposes to construct an electric railway from Fairmont to Blacksville, thence to Waynesburg, and on to Pittsburgh. The company also proposes an electric railway from Fairmont to Mannington, thence to Blacksville, thence to Morgantown, thence along the Monongahela River to Fairmont. The incorporators are: William M. Laws of Jersey City, N. J.; H. F. Smith, J. R. Linn, S. E. Miller of Fairmont, and J. F. Beatty of Mannington.

Construction work has been started under the contract recently let by the Buffalo, Rochester & Pittsburg R. R., for the double-tracking and straightening of about ten miles of road between Newton and Mount Jewett, in McKean county, Pa. The cost of this construction will be $625,000.

Contractors have been going over the route of the projected extension of the Western Maryland R. R. to Connellsville, Pa., and it is more than likely that construction work will be started this spring.

The Bessemer & Lake Erie R. R., G. M. Gray, mechanical engineer, Greenville, will expend $200,000 in the Greenville shops this year. The new buildings will include an office building for the superintendent of motive power, a modern seventeen-stall roundhouse, to replace the one destroyed by fire, a forge building 400 feet long, an addition to the power plant 50 by 101 feet in size, a 2-story fireproof pattern shop 40 by 40 feet in size; a new coaling station, and several smaller structures. Work on the forge building and power plant addition has been started.

Announcement has been made by officials of the West Penn R. R. Co. that plans have been completed for the building of a branch line from Greensburg to the Jamison coke works, and thence to Latrobe, a distance of 10 miles. The West Newton and Hunter line will be built during the coming summer. Nearly all the rights of way have been secured. The line will be 20 miles long and will pass through the Yukon valley.

The Pottstown & Reading Electric Ry. Co., of Pottstown, will shortly commence work on the construction of its extension from Sanatoga to Royersford, via Linfield.

The Schuylkill and Dauphin Traction Co., has been asked to extend its lines eastward from Reinerton to the Keystone hotel, thence south and west to Orwin and north to Reinerton.

Advices from Somerset state that construction work on the Indian Creek Valley R. R. has been completed to Indian Head and that it is expected to have the new line open to traffic by May 1. With the line now under construction the company will operate 22 miles of track on its main road and about 10 miles of branch track in addition. It is reported that yards will be constructed at Indian Creek.

The Quaker City Construction Co. has been incorporated with capital stock of $10,000 and principal offices at Philadelphia, Pa., and will engage in the construction of roads, railways and public works. Sydney Kenney, F. H. Hickock and Harry J. Crossan, Philadelphia, Pa., are the incorporators.

Advices from Allentown, Pa., state that active construction work is now under way on

the double tracking of the East Penn R. R. between Allentown and Reading.

The Chambersburg, Greencastle & Waynesboro Traction Co. of Chambersburg, has commenced work on its extension in that city. Work will also be started shortly on the extension to Red Bridge and Blue Ridge Summit.

An ordinance has been before the city council of Wilkesbarre to give the Wilkesbarre Traction Co. permission to extend its Grove and Brown street line so that the route will extend over Blackman street to South Main, thence to Horton and down South Franklin to the city line, completing the circuit and returning by way of Carey.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Virginia-Carolina Ry., W. E. Mingea, president, Abingdon, Va., has about secured the necessary capital for the construction of an extension from Bristol to Charlotte, N. C. The road at present extends from Abingdon, Va., to the Virginia coal fields and towards the timber belt of North Carolina. A cut-off will be constructed from Bristol, connecting with the line now built, and the road will be extended to Charlotte, N. C. It is thought that the work will begin in the near future.

Surveys have been made for the projected line of the Tennessee, Alabama & Kentucky Ry., and the promoters hope to have construction work started in the near future. The line proposed will extend from Chattanooga, Tenn., to Louisville, Ky. The route in Tennessee passes through Hamilton, Sequatchie, Bledsoe, Van Buren, White, Jackson and Putnam Counties, Rutledge Smith, Cookeville, Tenn., is interested.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Houston Electric Co., David Daly, manager, Houston, has plans well under way for the extension of the south end street car line out Fannin street beyond the city limits, to connect with the electric line recently completed by the Westmoreland Farms Co., beyond the Rice Institute site.

Austin Electric Ry. Co., Wm. J. Jones, president, Austin, is considering making a number of extensions and other improvements to its lines in Austin.

The construction of a pleasure pier at Port Arthur to cost $100,000 is proposed. C. E. Smith, Port Arthur, is interested.

The Commissioners' Court at Cameron has made an order approving the estimate of the levee for the Hefley improvement district and directing that bonds may be issued. As soon as the bonds are approved by the attorney general the commissioners will advertise for bids for the building of the levee.

Surveys are being made for a 12-mile extension on the Sugarland Ry., from Juliff to the State farm road. W. C. Yearger, Sugarland, Tex., is chief engineer.

Surveys have been made and a good part of the right-of-way secured for the construction of a standard-gage railroad from Houston to Penn City. The road will be constructed by a Pennsylvania syndicate which is interested in the development of Penn City. C. L. Walther, Pittsburg, Pa., is the representative of the syndicate.

The railroad committee of the town of West, J. H. Chambliss, chairman, is seeking to have the Houston & Texas Central R. R., extend its line from Ross to West, a distance of six miles. I. A. Cottingham, Houston, is engineer. H. & T. C. R. R.

Track laying on the Sterling City extension of the Santa Fe was to have been commenced about the middle of the month and rushed forward so that trains could be in operation by July 1.

Good progress is being made with the plans for building a railroad from Waco to Georgetown by way of Belton. Surveys for such a road were made a few months ago. George Tyler and G. M. Felts, Belton, are interested.

The Seguin Water Power Co. of Seguin has been organized with a capital stock of $100,000 and proposes to develop power in the falls in the Guadalupe River, about two miles above the city. There is a natural rock dam at this spot giving a fall of 7 ft.

We are in receipt of advices from El Paso, Tex., that the El Paso & Southwestern Ry. Co. is considering the construction of a line to Tucson, Ariz., a temporary terminal. Later the line will be constructed by way of Phœnix, thence to Yuma, to connect with the San Diego Southern Ry., thus giving the new line direct connection with San Diego, Cal. As projected the main line will form a junction with the Red Rock & Silverbell R. R. of the Imperial Copper Co. at Red Rock; a branch will then be constructed from Port Lobos, Mex., to tap the Red Rock & Silverbell line at Sasco. H. J. Simmons, El Paso, Tex., is general manager of the E. P. & S. W. Ry.

The Texas North & South R. R., of Coleman, Tex., has filed articles of incorporation with a capital stock of $360,000 and proposes the construction of a railroad from Coleman to New Braunfels, which will pass through Baylor, Throckmorton, Shackleford, Callahan, McCullough, San Saba, Mason, Llano, Gillespie, Kendall and Comal Counties. The incorporators are all of Coleman, Tex., L. E. Collins being among the number.

The Missouri, Kansas & Texas Ry., has completed surveys for three different routes for a connecting line from its Trinity & Colmesneil Branch to either Waco, Granger or Temple, Tex. A. M. Acheson, Dallas, Tex., is Acting Chief Engineer of the company in Texas.

The Stone & Webster Engineering Corporation of Boston, Mass., has begun to let contracts for the construction of the Houston-Galveston interurban line. The North American Dredging Co., Galveston, has been awarded the first contract, which calls for filling in on Galveston Island for a distance of 2½ miles and requires the sluicing in of 100,000 cu. yards of material. Bids for grading the 16-mile section from a point about 2 miles above the Galveston causeway to Clear Creek, are to be in by March 18. Mark Lowd, Houston, is southwestern superintendent for Stone & Webster. Shortly after that bids are to be in for the grading of the second section, 19 miles in distance, from Clear Creek to Brays Bayou, and shortly thereafter the final section to the city limits of Houston, a distance of 2½ miles. Bids have also been asked on 130,000 ties and for the timber necessary to construct some 3,000 feet of trestles. There will be some 30 odd trestles constructed on the entire road varying in length from 30 to 660 feet, the longer distances being necessary where bayous are struck at an angle, such as that of Clear Creek, where a considerable stretch of low land on one side of the bayou must be bridged. The longest trestles are those at Clear Creek, 660 feet; Dickinson Bayou, 500 feet, and Brays Bayou, about 300 feet. The tracklaying etc., will be done by the Stone & Wekton corporation, under the direction of J. B. Townsend, chief engineer, First National bank building, Houston.

Crosby County is raising a bonus of $150,000 to secure the construction of a railroad into Crosbyton. Julian M. Bassett, Crosbyton, is interested.

The city of Weatherford has accepted the proposition of the Mitchell & Pigg Construction Co., to build the Chicago, Weatherford & Brazos Valley R. R. Weatherford will give a bonus of $60,000 for the line to go north to a connection with the Rock Island, probably at Bridgeport.

Citizens of Canyon City are advocating the construction of an interurban line between Amarillo and Canyon City.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

William H. King, Salt Lake City, acting as local representative of a syndicate of eastern capitalists, is to apply to the city and county for franchises for an electric railroad from Salt Lake to Wasatch, in Little Cottonwood canyon, where a summer resort is to be built by the builders of the interurban line.

The Provo Reservoir Co., of Provo, which is to build a canal from the mouth of Provo canyon northward to irrigate the high lands of Utah county as far north as American Fork, has let contracts to build 2½ miles of the canal. Contracts for additional work will be let shortly.

The Joseph and Cove Highland Canal Co. of Joseph, Sevier county, has filed articles of incorporation with the secretary of state yesterday, taking over a ditch and water right at Joseph. The capital is $8,000. The officers are W. J. Carter, president; J. E. Leavitt, vice-president; Ed. Rose, secretary and treasurer.

City Council of Brigham City and the County Commissioners have been considering application of the Ogden Rapid Transit Co., for franchises for the extension of lines from Hot Springs to Brigham City and along the streets of the latter town. If granted, the final difficulty in the way of the interurban line will be removed and active operations will commence. The line would probably be opened next fall in time for the beet hauling season.

The Belknap Power Co. of Richfield, has been reorganized and its reported that eastern capital has been secured to carry out the proposed power development. The company now has a small force of men at work in the approach to the proposed tunnel. J. B. Weimer is manager.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Richmond, Va., is to appropriate $20,000 for building a city wharf.

Surveys are being made from the eastern terminus of the Chesapeake Western Ry. from Elkton, Md., Rockingham County, through Madison, Greene and Orange counties. The Chesapeake Western, it is reported, has recently been acquired by the Pennsylvania. W. E. D. Stokes, 73rd St. and Broadway, New York City, is president and general manager of the C. W. Ry.

Surveys for the extension of the Richmond, Chesapeake Bay Ry. to Washington have been completed between Ashland and Fredericksburg. The route crosses the Chesapeake and Ohio just west of Doswell. William Northrop, Richmond, Va., General Manager.

The stockholders of the proposed Roanoke & Bent Mountain Ry. Co., at a meeting held at Roanoke, Va., recently elected the following officers: A. L. Sibert, president; R. H. Angell, vice-president; C. M. Armes, secretary and treasurer; C. G. Ogden, general manager.

St. Albans, Johnson & Briggs, of Richmond, Va., have secured a contract from the Chesapeake & Ohio Ry, for building 5 miles of line on Horse Creek, in West Virginia for the Coal River Ry.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Commercial Club of Bellingham has secured the subscriptions for $400,000 worth of stock in the Whatcom County Railway & Light Co., asked for by Stone & Webster Engineering Corporation, Boston, Mass., preliminary to construction of an interurban line between Bellingham and Skagit county points or Burlington, Mount Vernon and Sedro-Woolley Construction work on the 30 miles of road is to be started on April 1. R. T. Laffin, Seattle, Wash., is district manager for Stone & Webster.

Residents of Chesaw, under the leadership of the Commercial Club, are going to build three miles of railroad to connect the town with the V., Y. & E. branch of the Great Northern.

Watson & Snow, railroad contractors, have sailed from Seattle to Alaska to complete their contract on the Alaska Northern R. R. Watson & Snow have the contract to complete the road to Mile 72.

Plans have been announced for an interurban railway between Aberdeen and Seattle.

The company will probably be known as the Western Washington Railway & Navigation Co., and will have its headquarters in Aberdeen. Surveys are to be started shortly. C. C. Quackenbush, Aberdeen, is interested.

The Chewach Canal Co., of Winthrop, has been incorporated with a capital stock of $12,000. the incorporators being W. C. Hanks, C. E. Cotton and H. E. Seniff.

The Great Northern Ry. is stated to have been making surveys with a view to building a cut off from Harrington to a point in the main line below Wilson Creek, to avoid the inconveniences caused by the high waters from Lamono to Wilson Creek.

H. L. Mardy, of Spokane, and J. L. Leeper, of Orient, have filed on power sites in the Kettle River at a point a little below the town of Orient and will develop power for that place.

Bids are to be asked this month by the city of Seattle for filling in Westlake avenue. The work will cost about $300,000 and will involve the moving of several hundred thousand cubic yards of dirt, R. H. Thomas, Seattle, is city engineer.

According to advices from Tacoma, Wash., work will be started soon on the water grade line of the Northern Pacific Ry., from Tacoma northwest via Point Defiance and the Narrows. The plans call for the construction of a 900-ft tunnel at Point Defiance. Peter Sims, Spokane, Wash., is contractor.

The North Coast R. R. has filed amended articles of incorporations, announcing its purpose to build and operate the following lines of railway. From Seattle to Spokane, 350 miles, through the counties of King, Pierce, Lewis, Yakima, Benton, Franklin, Adams, Whitman and Spokane, with a branch from the line in either Benton or Franklin county, 75 miles to Walla Walla; branches from points on the line in Adams County respectively to Eureka Junction, Davenport and Wilson Creek, and from Spokane southeasterly to Tekoa and thence to Lewiston, Idaho. Work on this road has been underway for some time. F. L. Pitman, Spokane, Wash, is chief engineer.

The Seattle-Snohomish Electric Ry. Co. has applied for a 50-year franchise for an electric street railway over the streets and avenues of Snohomish. This company recently purchased the Snohomish electric light system. According to its representative C. W. Kimball, of Seattle, the company will build an interurban line from Seattle to Snohomish, via Bothell.

The Chicago, Milwaukee & St. Paul Ry. is said to intend to relay its tracks between Madison and Portage.

A. E. Rau, engineer, St. Paul, Minn., has completed preliminary surveys for the proposed railroad from Gilmanton to Fountain City. A feasible route from the Waumandee Valley is said to have been found.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Portage has granted a franchise to the Chicago & Wisconsin Valley R. R. Co. to pass through the city and to install a local street car line within the city. The company will begin the work of construction at Portage just as soon as the frost is out of the ground and the material to commence the work has been ordered to Portage. This new railroad is an electric line and will be built from Janesville to Merrill. The survey has been made from Stevens Point to Madison, the line passing the entire length of Adams county north and south, touching Friendship, Easton, Briggsville, Portage, Lodi, Middleton and Madison. Work will commence at three points on the line, Portage, Madison and Stevens Point. The survey will be completed from Stevens Point to Merrill and Madison to Portage as soon as the permanent lines are completed from Madison to Stevens Point.

W. F. King, Duluth, Minn., has begun work on the section on the Interstate railroad which will connect Pokegama Junction, and present terminus with dock sites on Wisconsin Point Work was started at Saunders, where a subway is being constructed under the Great Northern ore yards and works. The excavation will be continued eastward from the subway to the Nemadji River bank where a steel bridge is to be erected at a cost of $250,000. There is considerable grading and filling to be done between the Nemadji and the Wisconsin plant and as a result may not be laid on that section of the line until late next fall. across the Big Pokegama river to the west Either a fill or trestle will have to be built of Saunders. The entire force of men employed by Contractor King on the concrete work of the St. Louis River bridge will be taken to Saunders as soon as the work at the present location is finished. There are about 400 men working for Mr. King at the St. Louis River bridge now.

E. E. and Gail Woodworth, Eugene Willard, Edward Norton, John K. Land, John Rowe, George Dennison and William I. Barrager, mill wrights of Stevens Point, have gone to canal zone in Panama, where they will erect a lumber mill for the Panama-American Land & Lumber Co., a corporation with headquarters at Peoria, Ill. They expect to be gone a year.

As soon as weather conditions will permit work is to be started on extensive improvements to the plant of the General Electric Co. at St. Croix Falls. The cost of improvements and extensions will approximate $750,000, the estimated cost of the addition to the power plant being nearly $500,000. An itemized statement of the estimated cost is as follows:

Addition to St. Croix Falls station and lines from St. C. F. to Minneapolis	$400,000
So-called short extension in Minneapolis	150,000
Underground work in Minneapolis	70,000
Remodeling substation "A"	56,000
Rebuilding Garfield avenue substation and cable line to substation "A"	25,000
Tie lines from Main street station to substation A	30,000
Additional feeder lines in center of city	30,000
Total	$755,000

The Chicago & Northwestern Ry. Co. has purchased all right of way for the proposed extension to Friendship, Wis., and also a tract of land for the construction of station, roundhouse, shops and division headquarters. S. S. Long, Antigo, Wis., is acting division engineer.

According to advices from Barberton, O., Paul & Henry Coal & Ice Co., Barberton, which is also interested in railroad construction have closed a contract for building a railroad in the central part of Wisconsin and work will be commenced in about two months.

It is reported in Janesville, Wis., that the Chicago Milwaukee & St. Paul Ry. Co. is planning the construction of large sorting yards near Janesville.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Toronto Ry. Co., R. J. Fleming, manager, Toronto, Ont., is planning to begin work shortly on the construction of an extension of its street railway to the North Rosedale district.

The Dominion Legislature has empowered the Temiskaming & Northern Ontario Ry. Commission to extend its lines from a point just above Matheson in a southwesterly direction into the Township of Tisdale and Whitney. The building of the branch to Elk Lake and Gowganda will depend upon the developments in the Porcupine fields. S. B. Clement, North Bay, Ont., is chief engineer.

Property owners in Elbow Park have asked that the city of Calgary, Alberta, extend the street car system from its present terminal, to a point on Elbow River. City Engineer Childs, of Calgary estimates that extension would cost $12,000.

In order to be in a position to compete with the Great Northern Ry. for traffic between Vancouver and the Kootenays via the rich Similkameen and Okanagon districts, the Canadian Pacific Ry. will build a line this spring over the Hope Mountain. Surveys have been completed by both companies across the mountains, and it would appear that the Canadian road has been able to secure a lower gradient across the summit than its American rival. It is understood that a maximum gradient of 2.2 per cent going west has been secured, which is lower than anything as yet secured by the engineers of the Great Northern. Two years will see the completion of a direct C. P. R. line between Hope and the Kootenays. At or below Hope, a bridge will be built across the Fraser. The C. P. R. route from Hope, a point in Fraser River valley, is across the mountains to Coquehalla summit, thence down to Coldwater River, a distance of 13 miles, then over a low divide to Otter Creek and on into the fertile Similkameen district. From Penticton the line will cross a summitt, and proceeding via the west fork of Kettle River reach the C. P. R. branch line now in operation as far west as Midway.

The Canadian Pacific Ry. Co. has appropriated $2,000,000 for the construction of terminals on Island No. 1, near Fort William, Ont., and work will be started as soon as weather permits. The above appropriation does not include the cost of constructing the Kam bridge or new freight sheds. F. S. Darling, Toronto, Ont., is engineer.

The Government of Saskatchewan has guaranteed the bonds on a line of the railway to be built by the Grand Trunk Pacific Ry. Co., from Regina Sask., to Sherwood, N. Dak. As projected the line will run between the Arcola and Soo lines from Regina to the Estevan branch of the Canadian Pacific Ry., crossing it near Hirsch, east of Estevan, and continuing in a southeasterly direction through Bow district south of Oxbow and thence through Workman and across the international boundary line into Sherwood. H. G. Kelly, Montreal, Que., is chief engineer.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Mexican Pacific R. R. Co. recently incorporated under the laws of Delaware with a capital stock of $40,000,000, has secured a number of concessions from the Mexican government. They propose the construction of a 350-mile railroad along the west coast of Mexico beginning at Salina Cruz, Oaxaca, and extending to the port of Manzanillo. Judge G. W. Baitch, Salt Lake City, Uutah, is legal representative of the company. Harold G. Villard, New York City, is president.

A concession has been granted by the federal government of Mexico to William P. Wood for the construction of a 650 mile railroad forming the connecting link between Mexico City and Merida, Yucatan. The line as projected will start at Santa Lucrecia in the state of Vera Cruz, traversing portions of the states of Vera Cruz, Chiapas, Tabasca, Campeche and Yucatan. United States capitalists will finance the project.

The Chicago & Northwestern Ry. is to have work resumed on its Hitchcock-Onida branch as soon as weather will permit. A large amount of material has already been transferred to Onida, N. Dak., preparatory to beginning work.

A bill is before the Maryland legislature to incorporate a company to build an electric railway between Silver Springs and Damascus, Md. The company is to have a capital stock of $250,000, Charles F. Neswitt and Lee L. Latimer, Washington D. C. are interested.

Officials of the Fernwood & Gulf R. R. Co., are considering bids for the construction of a 5-mile stretch of the proposed line toward Columbia, Miss. The Worthington Construction Co., which has a contract with the railroad is making rapid progress. I. C. Enochs, Fernwood, Miss., is president of the railroad company.

Ballinger's Criticism of the U. S. Reclamation Service, and a Suggestion That One of the Cabinet Should Be an Engineer.

Most of our readers will have seen the daily press reports of the testimony of Mr. Arthur P. Davis, Chief Engineer of the U. S. Reclamation Service, as given before the Ballinger investigating committee. It is made clear from this testimony that Secretary Ballinger is not well qualified to judge of the work done by the U. S. Reclamation Service or of the engineering organization that has had charge of it. For example, Mr. Ballinger believes that the engineers are receiving salaries that are too high! He believes that Director Newell is incompetent. He intimates that the Reclamation Service has not been fair to contractors! He questions the high cost of the work, and yet is unquestionably incompetent himself to judge unit costs.

While ENGINEERING-CONTRACTING has criticised the high cost of some of the work done by day labor by the Reclamation Service, it has realized that high unit costs were to be expected on much of the work, due to local conditions. It has also realized that the Reclamation Service felt impelled to do some of the work by day labor, because of high prices bid by contractors. Yet ENGINEERING-CONTRACTING has never made its criticisms in an unfriendly spirit, or because it lacked appreciation of the excellent work done by the Reclamation Service, taking their performances as a whole, but rather because it regretted seeing their splendid work marred by even the slightest departure from the sound economic policy of doing all construction by contract.

In Secretary Ballinger's blunders we have again an illustration of the danger that civilians run when they attempt to criticise the work of engineers.

Vast as are the engineering undertakings of the federal government, why is it that not a member of the President's cabinet is an engineer? It would seem that at least one of his "official family" should be an engineer of national standing. Surely the time has come when some professional men other than lawyers should share the responsibilities that rest upon a presidential cabinet.

How to Increase the Efficiency of the Civil Service.

Among the letters to the editor which we publish this week will be found two relating to our editorial remarks under the above caption in Engineering-Contracting for Feb. 2, 1910. It will be noted that these letters both were from civil service employers, one from New York and one from Chicago, the largest two cities in the United States and the two cities carrying the largest number of civil service employes on their pay rolls. These letters are so instructive, each in a different way, that we shall comment on them at length.

The Chicago man somehow cannot get away from the meaning now attached to the words "Civil Service." To him it is still a method for appointment. As explained in our editorial all men employed in the civil service departments are designated thus as distinguishing them from men in the military and naval establishments. Owing to the way examinations have been conducted and appointments made, the average man no longer looks upon the civil service idea as one that attempts to secure fit men—and fit men only—for the public service, but it refers to public servants who have been appointed after due compliance with certain rules and regulations to a life position. The question of good service and fitness and ability are not thought of but the machine like rules and regulations are always uppermost. We would suggest to those interested a re-reading of the editorial referred to by our correspondents.

Taking up the Chicago case first. There is a senseless rule that the names of eligibles will be retained on an eligible list for two years only. Can any mortal man of common sense give a good reason for this? Take a case that actually occurred in Chicago. Four years ago a man passed an examination for a position paying $175 per month, but not passing close enough to the head of the list, he did not secure a position. He did secure a position as a designer with a firm for a short time and made $200 per month, going from that to the superintendence of two pieces of work at a combined salary of $250 and then as chief engineer of another company at a salary of $300 per month. In two years his name was dropped from the eligible list, just as his last job was completed. That man was more competent on the day his name was dropped from the eligible list than the day it was first put there. Why was it dropped? Merely because that was the rule and rigid adherence to rules marks the mind of the average present day Civil Service administrator. The rule as to eligible lists should be changed to require every person on any eligible list to file a sworn statement at least once each year to the effect that his, or her, employment in the interim had been substantially in the kind of employment for which the eligible list was created. This then would tend to keep a man ready just as long as he wanted to be kept on the list. The man of whom we wrote was dropped from the list because the two years had elapsed and he would not have been able to get again on an eligible list without passing another examination. If he had received the position for which he had taken the examination most of his time would have been put in setting grade stakes for sewers and streets. The work he actually did was to design structures costing many thousands of dollars and to look after their construction. Yet after two years of this class of work he was not considered fit to work in the city hall until he passed another examination, merely because the two years his name was kept on the list had expired.

No examination has since been held to create another eligible list in that grade but it has been said that within the past two years some more "60 day" men have been certified. The Civil Service Commission is not honest if it does not maintain an eligible list for every department and grade. The plea has been made that frequent examinations cost money but that is because of the senseless two year rule for eligibles. There is no reason why "60 day" men should ever be on any list. To see so many on the list is bound to give color to charges that the Civil Service Commissioners stand in with the politicians to negative the efforts of men who had the law put on the statute books in order that all appointments to the public service should be based on fitness. Charges are made that after a certain number of "60 day" men have served long enough to get a good experience rating that an examination is ordered to create an eligible list, and it is noticeable that these "60 day" men generally pass highest and secure their jobs for life. These may be rumors but the fact that they are persistent indicates that something is out of joint in the administration of the civil service laws in the city of Chicago. Our Chicago correspondent speaks dispassionately of a matter that is in need of attention.

The New York letter is remarkable. In our editorial we said nothing whatever about men having to pass examinations at intervals in order to retain their positions. We stated that after a man had passed he was supposed to be eligible and that the entrance examination was to determine fitness and should not be competitive. Therefore all men who passed should be eligible for selection, not merely those who had the highest marks. After appointment the efficiency rating given each month should settle whether a man should remain in the service, or not. We suggested an appointment for one year and if the efficiency was good then a reappointment for five years and if the efficiency rating was good during that term, then a life appointment. The appointee would be subject always to automatic removal for lack of efficiency and attention to business, during the first six years. After that removal only after trial.

The remainder of the letter makes us ashamed to know that the writer is an engineer. The engineer who is not employed in a city job for life as the result of a few days' strenuous review of text books and a written examination, has to take what pay he can get when he gets it. He is never secure in any position. Taken on today, laid off tomorrow, his pay fixed by the laws of supply and demand, he has to do as much work as the man at his elbow or be discharged ahead of time from what is at best a position of uncertain tenure. Under such circumstances he has lifted his profession to a plane where hon-

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

esty is the ruling guide of an engineer's conduct. Lapses there are occasionally but they are often through stress of circumstances beyond the control of the man. The profession itself is judged by the honesty of the men who follow it.

What term can be applied to a man who holds on to a position and gives as little as he can simply because he feels he is not appreciated? He seeks the position voluntarily. No one compels him to accept it. He can quit any time he likes and resume again the wandering life of his brother "job chaser." We notice he intends hanging on but thinks he is an object of pity, which, verily, we think he is; not, however, for the reasons he would assign. If he wants (to quote his letter) "a cause for hope, antidote for discouragement, a financial reward for proven merit," let him throw up his civil service job and join the crowd of men not so fortunate as to have a life job and compete with them in the fight for a livelihood. There is a tremendous difference between the ambition of the large-minded man and the desire of the small-minded man, although the latter always mistakes desire for ambition. Our correspondent is not ambitious and it is the curse of the present civil service organization that so few ambitious met get an opportunity, simply because of the men whose only desire is to do as little as they can for their money and who watch the clock. The transitman on a railroad gets from $75 to $90 per month and expenses. A leveller gets from $50 to $80 per month and expenses. A chief of party gets from $125 to $175 and expenses per month. An engineer on construction work seldom gets more than $125 per month and expenses, and the editors know able men getting only $75 to $100 per month and expenses in charge of quite important work. As a rule the men in the engineering departments of the cities under civil service regulations get slightly better pay, considering the class of work they do, than the men working for railroads and other corporations. Yet the civil service employee has a life job and the other men are never sure when theirs will end.

We believe in engineers getting all the pay they are worth and believe also that the pay in transient employment is generally too low. No good reason exists, however, for paying city hall employes more than their less fortunate professional brethren when the city hall man is secure in his position for life or during moderately good behavior. There should be a minimum entrance pay rising by very slow and moderate annual increases to a maximum and this maximum should be what commercial corporations pay for similar work. A dissatisfied employe may resign or he may take a promotional examination when opportunity offers. To encourage the men permission should be given them to take one promotional examination each year without loss of time, being docked for time if other examinations are taken. At present, we are informed, the practice in Chicago is to dock a man for time spent in taking examinations. The custom has arisen because many of the employes made a practice of taking every examination offered. While some safeguard was necessary, the present rule is calculated to discourage ambitious men. Much of the dissatisfaction at present existing is caused by the lack of control department heads have over their subordinates. This leads to an over-manning of many departments so that promotion is slow and the atmosphere is deadening to ambition. In the summer months when construction work is rushing, a large number of men must be employed and they have to be carried through the winter. Large corporations do not carry the men through the winter, but we do not advocate such heartlessness in public offices. Engineers in private practice generally try to secure as assistants men who can work in the office and in the field, thus employing the men when practicable on office work and designing when field work is stopped. By co-operation between and a proper co-ordination of, the various departments much could be done by following the practice of trying to do nearly all office work at the time of year when field work is impossible.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

A Simple Method of Computing the Strength of Flat Reinforced Concrete Plates.

One of the most recent developments of reinforced concrete is the type of floor originating with Mr. C. A. P. Turner and known as the "mushroom floor." While this system is in its infancy as yet, examples of it are nevertheless sufficiently numerous to be more or less familiar to all building designers. The absence of beams, the increase of head room resulting therefrom, the low cost of centering, and the comparatively small amount and simplicity of the steel reinforcement unite to make this system desirable for many buildings and relatively low in cost. With its advantages, however, it has some disadvantages, perhaps the most important of which is a lack of detailed analysis of the internal stress occurring in a slab of this kind. It may be mentioned that this analysis is not necessary for safe construction, for as the more or less empirical formulas we have seem to give results sufficiently strong, enough confidence can certainly be placed in the formulas to enable the designer to guarantee a test load of twice the designed live load over an entire bay without harm to the construction and with a very insignificant amount of deflection.

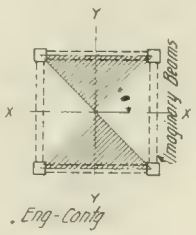

Fig. 1.

About two years ago the writer had occasion to design floors of this kind for an office building in Portland, Me. At that time the amount of information concerning the stresses in the concrete plate was very limited, and the writer had some difficulty in finding a satisfactory solution.

A good deal of study of buildings designed by the inventor gave the impression that Mr. Turner used a formula equivalent to about $M = \frac{WL}{48}$ to get a bending moment, and that he then solved for an area of steel and distributed the resulting amount uniformly or nearly so, in the different directions. This seemed so extreme, however, that no confidence was placed in the result and various other ways of solving the problem were tried.

For purposes of comparison the writer proposes to give a description of the different methods then used or that have since come to his knowledge, together with the solution of each of a typical floor panel. They are as follows:

(1) To consider the slab around the head of the column out to the point of inflection as a cantilever supporting a uniform load over its surface and a concentrated load consisting of the rest of the slab hung from its periphery. This will be called the "Cantilever System."

(2) To consider the slab around the head of the column out to the point of inflection as a flat, circular plate supporting a uniform load over its surface and a concentrated load consisting of the rest of the slab with its superimposed load hung from the perimeter of the plate. Diagrams for the analysis of this method are given in Turneaure and Maurer's "Principles of Reinforced Concrete," pp. 272 and 328.

The first impression of these two methods is that they are almost identical, but the solution and final results are quite different.

(3) Grashof: In Green's "Structural Mechanics," on p. 255, are given the formulas for deflection and bending moments in a plate supported on rows of points forming squares whose side is L. A direct application of this to the typical case will be tried. Two other methods result from different application of these formulas, Mensch and the writer's.

(4) Mensch: A more or less incomplete description of this method is given by Mensch in his Pocket Book on p. 81 as follows:

> The problem of calculating the stresses in a plate supported at four points was first thoroughly investigated by Grashof in connection with the strength of end plates in steam boilers. He gives the greatest bending moment per lin. ft. in such a plate as $\frac{WL^2}{26.5}$, which formula he derived more by an elimination process than by exact science.
>
> By similar reasoning we lay down the following rule for the computation of girderless floor construction:
>
> Divide the panels in strips of a width equal to 0.35L when L is the distance in feet from center to center of support; two strips run diagonally, while the others run in the line of the columns. The greatest bending moment of such a strip we assume to be $\frac{WL^2}{20}$ when the size of the capital is at least 0.23L.
>
> From this bending moment we easily obtain the required thickness and reinforcement given in the slab tables on pages 16 to 20.

In the solution of the typical case the writer has simply copied the slab thickness and amount of steel directly from the tables mentioned, and has not endeavored to perform the actual necessary operations.

(5) Turner's: Turner confidently recommends and uses a formula that requires considerably less steel than any other method given here. He refers to Grashof's analysis of the stresses in plates given in Lanza's "Applied Mechanics," and to Professor H. T. Eddy's "Theory of the Flexure of a Thin Flat Circular Plate or Ring Loaded Symmetrically

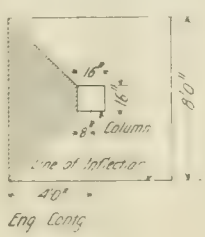

Fig. 2.

Above Its Center," Engineering Year Book, University of Minnesota, 1899.

In his book recently published on the subject he states that the bending moment $M = \frac{WL}{50}$, where W is the total load on the slab

*A paper by Angus B. MacMillan, Engineer Aberthaw Construction Co., read at the 1910 Convention of the National Association of Cement Users.

and L is the span in feet or inches according as the result is desired in foot or inch pounds. Having obtained the bending moment and assumed a depth for the slab, the area of steel is found. This area is divided in the different directions and placed in bands about 7/16 of the span in width. The method of getting the stress in the radial bars and circular rings is left in doubt. The writer has assumed that they have no function other than to keep the slab steel up near the top of the slab where it belongs when crossing the columns, and to a very limited extent to give a larger bearing for the concrete plate. What fixes the size of the column heads is not stated to the writer's knowledge. Turner supports his conclusions with the records of many slabs tested with loads largely in excess of the regular working loads.

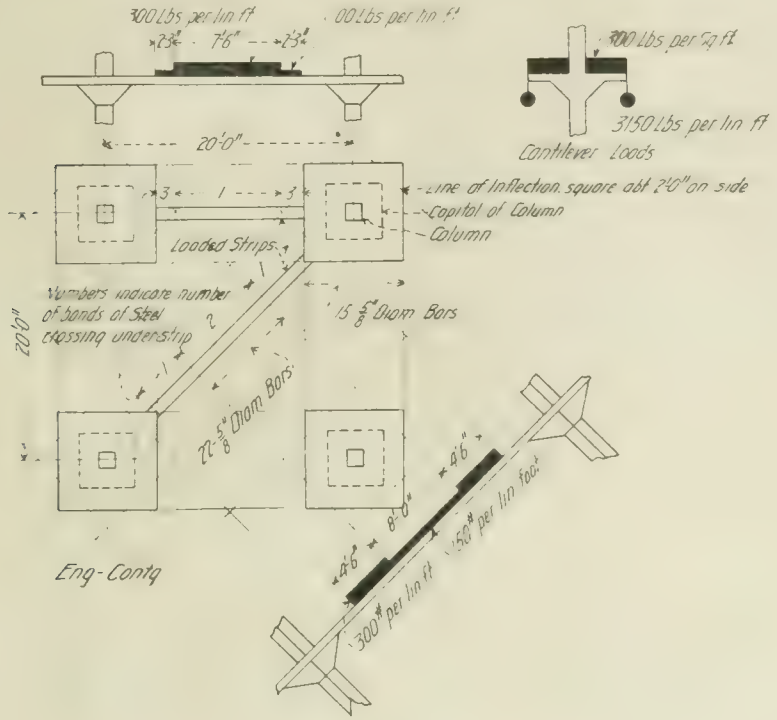

Fig. 3.

(6) MacMillan: This method is based on general deductions made from Grashof's analysis of the stresses in a plate supported at rows of points forming squares, whose side $= L$. Before taking up a typical case it might be well to indicate what these deductions were. Attention is called to the following formulas giving the maximum fibre stress in square plates uniformly loaded, but with different methods of support.

(a) For a square plate supported on two edges, $f = \frac{3WL^2}{4T^2}$

(b) For a square plate fixed on two edges, $f = \frac{WL^2}{2T^2}$

(c) For a square plate fixed on four edges, $f = -\frac{WL^2}{4T^2}$,

(d) For a square plate fixed on four points, $f = \frac{WL^2}{1.27T^2}$,

It is interesting to note that a plate fixed at four points is stronger than one fixed on four sides, and is 3.2 times as strong as one supported on two edges.

Now in the first formula the moment of resistance can be expressed by $M_r = \frac{WBL^2}{8}$

Therefore for a plate fixed at four points and the same unit load, the bending moment would be $\frac{1}{3.2}$ times this amount, or

$$M_r = \frac{WBL^2}{8\times 3.2} = \frac{WBL^2}{25.6}$$

Using 25 instead of 25.6 for a denominator, the result will be $M_r = \frac{WBL^2}{25}$, a formula that expresses the maximum stress over the head of the column.

Out in the center of the slab, the stress would actually be about one-half of this, or $\frac{WBL^2}{50}$. However, while in continuous slabs supported on beams making the different spans equal, the bending moment at the center of the span, $M_r = \frac{WL^2}{24}$, the different city building laws only allow the use of $M_r = \frac{WL^2}{10}$ or at most $M_r = \frac{WL^2}{12}$.

So in this type of floor the writer sees no good reason for departing from a standard practice and has used the maximum moment and neglected the lesser one. Actually, as all bars are lapped over the columns, there is a large excess of steel at this point, but as the extra strength developed by the lapped bars is to some extent uncertain, it is probably better to get an excess than otherwise. Having determined the bending moment, it is a simple matter to get a steel area. This steel area is divided up into a number of small bars and distributed in uniform bands in the different directions.

It might be well to say at this point that two other distinct methods were tried without satisfactory results. One depended on considering the amount of load each separate bar should carry, allowing a certain amount of sag in the bar and figuring the stresses in the rod as a catenary. The other was to replace the straight bars from column to column by an imaginary beam on all sides of the panel as per sketch, Fig. 1, and to consider that the bending moment in plane $X - X$ was caused by the loading indicated by the shaded portions of slab, and that it was equal to $\frac{W}{2} L$, $\frac{}{12}$ where W equals total load on panel and L equals span. The steel to take up this stress was then obtained in the ordinary way except that the diagonal bars were considered to take a stress equal to 16,000 × sin. ϕ and to be equally effective in resisting stresses in a plane $Y - Y$. If the beams had really existed, this might have been permissible, but as they did not, it seemed that two other types of loading were possible, one giving $M = \frac{\frac{W}{2} L}{8}$ and the other $M = \frac{\frac{W}{2}}{6} L$, just double that originally considered.

Of course if the slab was considered continuous, these moments would in every case be cut down. However, the conditions were not satisfactory, and taking the most unfavorable method of loading, the amount of steel necessary was excessive.

The symbols that will be used in analyzing the different cases are as follows:

L = the span.
B = breadth of panel.
w = live load.
w_1 = dead load.
$W = w + w_1$ = combined load.
M = Bending moment.
R = Reaction at end of strip.
I = Moment of inertia.
ϕ = Angle.
Δ = Deflection.
T = Total thickness of slab.
$c = \frac{1}{2}T$.
E_s = Modulus of elasticity of steel in tension.
E_c = Modulus of elasticity of concrete in compression.
f_s = Unit fibre stress in steel in tension.
f_c = Unit fibre stress in concrete in compression.
d = Depth from top of slab to center of steel.
jd = Arm from center of compression to center of tension = 86d.
b = Width of strip considered.
A_s = Area of steel.
Σ = Summation.
V = Fibre stress in concrete in shear.
a = Span in inches in "Grashof" method.
r = Radius of column head.*
r_o = Radius of point of inflection.*
*Turneaure and Maurer method.

In working out the amount of steel in the different designs, the same unit stress—i. e., 16,000 lbs. per sq. in.—has been used in every case, and in Turner's method the slab has also been worked out for the regular working stress of 13,000 lbs. per sq. in. used by Turner.

In Turner's, Grashof's, and the writer's methods the unit stress will be less than that adopted for the "Cantilever" and "Turneaure and Maurer," as it was not considered advisable to make the slab less than 8 ins. thick, owing to difficulties arising in covering up the steel at the columns in thinner slabs.

In getting the deflection in the method called "Grashof" the deflection was assumed to depend directly on the modulus of elasticity of the concrete, which for stresses up to about

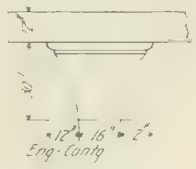

Fig. 4.

600 lbs. per sq. in. has been taken at 3,000,000 as recommended by Turneaure and Maurer in their article on deflections.

For a typical case to be solved by each method, let the span equal 20 ft., the live load equal 200 lbs. per sq. in., and the panel to be square.

(1) Cantilever method:
Let L = span = 20 ft.
Let w = live load = 200 lbs. per sq. ft.
Let w_1 = dead load.

Assume slab 8 ins. thick = 100 lbs. per sq. ft.

Assume columns 16 ins. square.

$W = w + w_1 = 200 + 100 = 300$ lbs per sq. ft.

Point of inflection of slab for uniform load $= \frac{L}{5} = \frac{20}{5} = 4.$

Lay out square with half diameter of 4' around column as per diagram, Fig. 2.

To get moments at side of column, let ab = one side of square = 8 ins.

Let uniform load on one side be as indicated by shaded portion $= \frac{(8 + 1\frac{1}{3}) \times (4 - \frac{2}{3})}{2} \times 300 = 4{,}667$ lbs.

Center of gravity of area $= \left(\frac{4 - \frac{2}{3}}{3} \times \frac{2 \times 8 + 1\frac{1}{3}}{8 + 1\frac{1}{3}} \right) \times 12 = 24\frac{3}{4}$ ins.

$M = 4{,}667 \times 24\frac{3}{4} = 115{,}500$ in. lbs.

We must add to this the amount of the concentrated load hung from the perimeter of the square. This is equal to the load on the entire bay minus the load on the square under consideration divided by the number of sides of the square equals $\frac{(20 \times 20) - (8 \times 8) \times 300}{4}$ = 25,200 lbs.

Lever arm = (4 ft. — ⅔ ft.) × 12 = 40 ins.

$M_2 = 25{,}200 \times 40 = 1{,}008{,}000$ in. lbs.

$M_1 + M_2 = 115{,}500 + 1{,}008{,}000 = 1{,}123{,}500$ in. lbs.

For maximum compression in concrete = 750 lbs. per sq. in.

For maximum tension in steel = 16,000 lbs. per sq. in.

$\frac{E_s}{E_c} = 15$ $M = 133\ bd^2$ and $A_s = .0097 \times b \times d$ taking b = 16 ins. = width of column side.

$d = \sqrt{\frac{1{,}123{,}500}{133 \times 16}} = 23.0$ ins., say 27 ins. from top of slab to point where column head starts to flare out.

Area of steel at this point = 23.0 ins. × 16 ins. × .0097 = 3.56 sq. ins.

It is advisable to obtain the moments and thickness of concrete required to resist the stresses found at several points between the side of the column and the line of inflection of the slab. With these additional points it will be quite easy to plot a curve for the column head. If these intermediate points are not located, it will be quite safe to carry the column head up at an angle of 45° with the horizontal, as in this instance. Later, when the amount of steel in the slab is obtained, see if it equals the area needed. If not, it will be necessary to add some extra bars over the column head.

Now consider the stresses in the diagonal bands. Take a strip, Fig. 3, 12 ins. wide between the points of inflection. As the bars cross in the center assume that each band of steel taken one-half the full load where they cross and the entire load where they do not cross. See diagram, Fig. 3.

The reactions at each end are equal as the load is uniform, and

$$\frac{4\frac{1}{2} \text{ ft.} \times 300 \text{ lbs.} \times 2 \div 8 \text{ ft.} \times 150 \text{ lbs.}}{2}$$

= 1,950 lbs.

$M = 1{,}950$ lbs. × 8.5 ft. − 4 ft. × 150 lbs. × 2 − 4½ ft. × 300 lbs. × 6¼ ft. = 6,938 ft. lbs.

6,938 ft. lbs. × 12 ins. = 83,256 in. lbs.

$d = \sqrt{\frac{83{,}256}{133 \times 12}} = 7.21$ ins.

Area of steel = 7.21 × 12 × .0097 = .8392 sq. ins.

If ⅝-in. round bars are used, the number of bars required will equal $\frac{.8392}{.3068} = 2.73$ in strip 1 ft. wide.

Then the spacing of bars in the diagonal bands will equal $\frac{12}{2.4} = 4.4$ ins. on centers.

Bands to be made 8 ft. wide, as this fills the area.

Next the stresses in the straight bands between lines of inflection will be obtained. These may be arrived at in a similar way. Take a strip 12 ins. wide. Over a portion of the length there is but one line of bars, so it may be considered that the whole load is acting here. Near the points of inflection, however, the diagonal bars cross and as there are three layers of bars, we assume that each line takes but one-third of the load at these points.

On this basis, the placing of the steel being symmetrical and the loads uniform, the reactions of the slab at each end are the same and

$$R = \frac{2\frac{1}{4} \text{ ft.} \times 2 \times 100 \text{ lbs.} + 7\frac{1}{2} \text{ ft.} \times 300 \text{ lbs.}}{2}$$

= 1,350 lbs.

M = (1,350 lbs. × 6 ft.) − (3¾ ft. × 300 lbs. × 1⅞ ft.) − (2¼ ft. × 100 lbs. × 4⅞ ft. = 4,904 ft. lbs.

4,904 ft. lbs. × 12 ins. = 58,848 in. lbs.

Using d same as obtained for diagonal strip = 7.21, and $jd = .86d$.

$$A_s = \frac{58{,}848 \text{ in. lbs.}}{.86 \times 7.21 \text{ ins.} \times 16{,}000 \text{ lbs.}} = 0.594 \text{ sq. in.}$$

= ⅝-in. round bars, 6.4 ins. on centers. Bands to be 8 ft. wide as before.

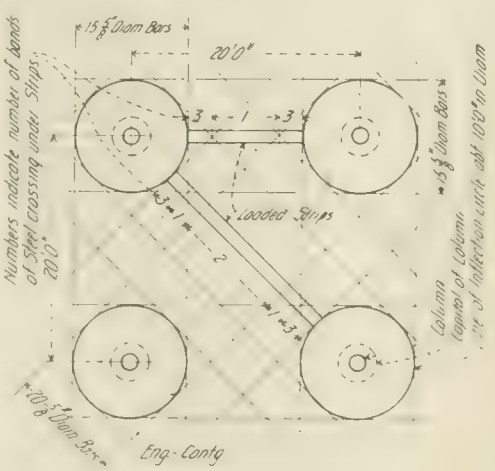

Fig. 6.

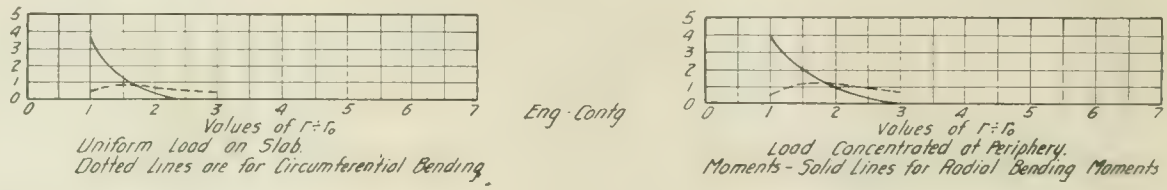
The total area of bars then that cross the column cap is equal to .594 sq. in. × 8 ft. × 2 ÷ .839 sq. in. × 8 ft. × 2 = 22.9 sq. ins.

As the bars if continuous would resist stresses in opposite sides of column head, take one-half the total area as effective for taking care of the stresses in any one side of the head.

Now $\frac{22.9}{2} = 11.45$ sq. ins., but from the previous calculations only 3.56 sq. ins. were found necessary, so there is a large excess of steel.

Actually this excess would be still greater, as in practice the bars seldom come long enough to be carried continuously over more than one span, especially in the diagonal direction, so a lap is necessary at the columns. The usual method is to schedule the bars long enough to extend 2 ft. beyond the center of the column at each end, making a lap of 4 ft.

(2) Turneaure and Maurer: A careful study of the diagrams given in the "Principles of Reinforced Concrete Construction," pp. 290 and 291, would indicate that as the ratio of r to r_0 decreases, the bending moments in the circular plate decrease. This being the case, it would seem to be an advantage to have a fairly large and very stiff column head. This is readily obtained with the common form of capital used in this type of floor. For instance, assume a circular column 16 ins. diameter. The column head has a flare of about 12 ins. and a depth of about 30 ins., as per diagram, Fig. 4, making a total diameter of about 40 ins. at the top. The ratio of depth to flare is 2½ to 1, which should insure ample stiffness. (Fig. 4.)



Values of r÷r₀
Uniform Load on Slab.

Values of r÷r₀
Load Concentrated at Periphery.
Moments - Solid Lines for Radial Bending Moments

Fig. 5.

To take the case used in the preceding examples: Span 20 ft. and live load of 200 lbs. per sq. ft. It will be necessary to assume the slab somewhat thicker than in the other cases in order to get enough material to resist the apparent bending moments. It might perhaps be admissible to thicken the slab gradually near the columns, but Turneaure and Maurer do not state this, and further it might complicate the centering to an extent that would not be economical.

Assume the slab 12 ins. thick. Taking concrete at 150 lbs. per cu. ft., the slab weighs 150 lbs. per sq. ft. of area. This added to the live load makes a total of 350 lbs. per sq. ft. With column spacing 20 ft. apart, the diagonals will be 28.28 ft. c. to c. As the point of inflection of the beam fixed at the ends and continuously loaded is about one-fifth of the span length from the end, take the mean for the straight length and diagonal. This will equal approximately $\frac{\frac{20}{5} + \frac{28.28}{5}}{2} = 4.83$, say about 5 ft.

Having assumed a line of inflection, the area inclosed may be treated as a circular plate having a uniform load over its area and a concentrated load hung from its periphery equal to the remainder of the panel load. This will equal

$$\frac{(20 \text{ ft.} \times 20 \text{ ft.}) - (5 \text{ ft.} \times 5 \text{ ft.} \times 3.1416) \times 350 \text{ lbs.}}{10 \text{ ft.} \times 3.1416}$$

= 3,580 lbs. per lin. ft.

The ratio of the column head to the diameter of circle assumed is as 1 to 3.

Referring to the diagrams, see Fig. 5 (pages 290 and 291), it is found that the moments caused by the uniform load on circular plate are:

(1) Circumferential at column = .4 × 350 × r^2 = 140 ft. lbs. per ft. width.

(2) Radial at column = 3.5 × 350 × r^2 = 1,225 ft. lbs. per ft. width. And for the concentrated load at the edge are

(3) Circumferential at column = .5 × 3,580 × 1 = 1,790 ft. lbs. per ft. width.

(4) Radial at column = 4 × 3,580 × 1 =

14,320 ft. lbs. per ft. width. Adding the moments together, we have 140 + 1,225 + 1,790 + 14,320 = 17,475 ft. lbs. = 209,700 in. lbs. per ft. width.

Under the same stresses, etc., used in the Cantilever system, $d = \sqrt{\frac{209,700}{133 \times 12}} = 11.4$ ins., a depth that does not allow very much room to cover up the steel with the thickness of slab assumed.

Assume that this stress is constant for every linear foot of circumference of cap. The circumference of the capital being equal to 40 ×

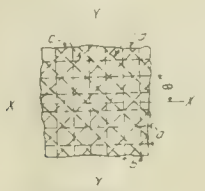

Fig. 7.

3.1416 = 125.66 ins., the area of steel needed around the column head = 125.66 × 11.4 × .0097 = 13.90 sq. ins.; but as the bars are continous, only one-half of this amount is needed: $\frac{13.90}{2} = 6.95$ sq. ins.

These bars are to be arranged in four bands over the head of the column, and the results will probably be near enough if the amount of steel (6.95 sq. ins.) is divided by 4 = $\frac{6.96 \text{ sq. ins.}}{4}$ = 1.74 sq. ins. in band the width of the column head:

$\frac{1.74}{40} = .0435$ sq. ins. per inch width.

Using ⅝-in. round bars with an area of .3068 sq. in., the spacing will be $\frac{.3068}{.0435} = 7.07$ ins. on centers. This spacing had better be continued out to the point of inflection in each case, making the bands 10 ft. wide. $\frac{10 \text{ ft.} \times 12 \text{ ins.}}{7.07 \text{ ins.}}$ = 17 ⅝-in. round bars per band. It may be that some of these bands can be omitted in the slab between the points of inflection.

Consider a diagonal strip first: Referring to the diagram, Fig. 6, noting the small figures that indicate the numbers of bars crossing, and assuming that each set of bars takes its proportion of the load, the loads are, scaling the distances:

$\frac{2 \times 2 \times 350}{3} + \frac{2 \times 2 \times 350}{1} + \frac{10 \times 350}{2} =$ 3,616 lbs.

The reaction at either end = $\frac{3616}{2} = 1,808$ lbs.

$M = 1808 \times 9 - 875 \times 2.5 - 700 \times 6 - 233 \times 8 = 8,020$ ft. lbs.

8,020 × 12 ins. = 96,240 in. lbs.

Taking depth to center of steel area as 10½ ins., it will be found that $\frac{96,240 \text{ in. lbs.}}{.86 \times 10.5 \text{ ins.} \times 16,000 \text{ lbs.}}$ = .667 sq. in. is needed and $\frac{.3068 \times 12}{.667} = 5.52$ ins. on centers, against the 7.07 in. previously found. It would seem advisable to space the bars somewhat close together in the diagonal directions, say 6 ins. on centers, making 20 bars in a 10-ft. band. This ought to allow of spacing the remaining bars somewhat farther apart.

The load in the straight direction on a unit strip equals $\frac{2 \times 2 \times 350}{3} + 6 \times 350 = 2,566$ lbs.

The reaction at each end equals $\frac{2566}{2} = 1,283$ lbs.

$M = 1283 \times 5 - 1050 \times 1.5 - 2.33 \times 4 = 3,908$ ft. lbs.

3908 × 12 = 46,896 in. lbs.

$\frac{46896}{.86 \times 10.5 \times 16000} = .325$ sq. ins.

$\frac{.3068 \times 12}{.325} = 11.35$ ins. on centers for spacing of ⅝-in. round bar.

As the stresses in the bars increase toward the edges of the bands, a spacing of about 8 ins. on centers is perhaps all that is advisable. That is equal to 15 bars in a band.

(3) Grashof's analysis of the stresses in a plate supported at rows of points making squares whose side is "a"

$$f = \frac{15 W a^2}{64 T^2}; \text{ and } \Delta = \frac{15}{512} \frac{W a^4}{E T^3}$$

As these formulas are worked out for steel plates, for which Poissom's ratio is somewhat different than that for concrete, the results obtained may not be accurate, but it will be interesting to make the comparison.

Let L = the span = 20 ft.

Let total thickness of slab = 8 ins.; dead load = 100 lbs. per sq. ft.

Let live load = 200 lbs. per sq. ft.

Let W = total load per sq. in. = $\frac{200 + 100}{144}$ = 2.08 lbs. per sq. in.

Let a = length of side in inches = 20 × 12 = 240 ins.

Let T = effective thickness of slab = 7 ins.

$f = \frac{15 \times 2.08 \times 240 \times 240}{64 \times 7 \times 7} = 573$, maximum fibre stress.

However, this fibre stress is based on the moment of inertia of a homogeneous material like steel, whose center of gravity is one-half T from the bottom. As this does not hold for concrete, the bending moment per unit width may be determined by the formula:

$M = \frac{fI}{c} - \frac{573 \times 7 \times 7 \times 7}{3.5} = 56,162$ in. lbs. per ft. width.

A somewhat lower stress on the concrete than in the previous example will be used. In this instance f_c = 650 lbs. per sq. in.

f_s = 16,000 lbs. per sq. in.

$d = \frac{M}{108b}$ and $A_s = .0077\ bd$.

From these formulas we get

$d = \frac{56162}{108 \times 12} = 6.59$ ins., which is fairly near the 7 ins. we assumed for d, and

$A_s = .0077 \times 6.59 \times 12 = .608$ sq. ins. per foot width.

From a comparison with the position and magnitude of stresses in continuous beams, it will be safe to consider the maximum stress in the present case is the negative stress at the column in the direction of the diagonals, and that the positive stress half way between the columns diagonally is but one-half this amount or less.

Also assume that the concrete plate will get the full stress indicated at the column and must be able to resist this stress from any direction, so that instead of one set of reinforcing bars, there must be at least two sets crossing at right angles to each other. Actually in this system there are four sets, which will be lettered a, b, c, and d, crossing as shown in the diagram, Fig. 7. It will now be apparent that any stress tending to rupture the slab in the vertical plane X—X will be resisted by bars b directly up to their area bA_s, and that bars c and d will assist in the ratio of $A_s \cos \phi$. Then to resist the stress in plane $X - X$,

$f_s (bA_s + cA_s \cos \phi + dA_s \cos \phi)$

$\phi = 45°$, so cosine $\phi = .707$

Now as the component forces of bars c and d for resisting stresses in the vertical plane $Y - Y$ are the same as for $X - X$, we may write $fs\ (aA_s + cA_s \cos \phi + dA_s \cos \phi)$ for the area of steel needed to resist stresses in $Y - Y$.

But it was previously found that .608 sq. ins. of steel was needed to resist M in any one

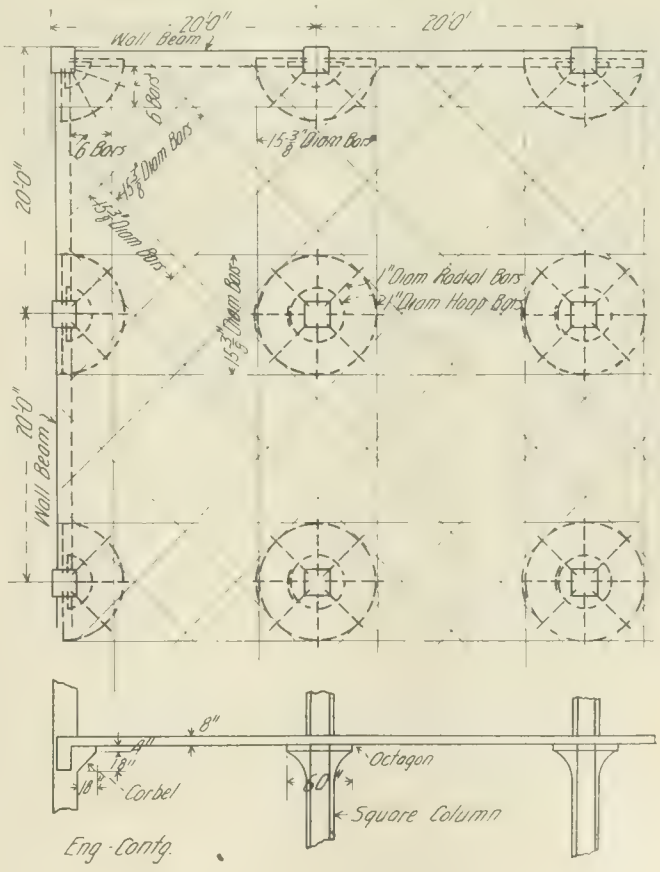

Fig. 8.

plane, say $X - X$, therefore the same amount will be needed for the equal stress in $Y - Y$; $2a.f_s + b.f_s + 2c.f_s \cos\phi + 2d.f_s \cos\phi = f_s\ (2 \times .608)$ for an area 1 ft. square.

As f_s is constant and bands a, b, c, and d are equal, $A_s = \frac{2 \times .608}{2 + 4 \times .707} = .252$ sq. in. per ft.

If the area of a ⅜-in. bar = .1104, the spacing of the bars equals $\frac{.1104}{.252} \times 12 = 5.25$ ins. c. to c.

Now if bands are made the width Mr. Turner recommends—i. e., $7/16L$— the number of bars in a band will equal $\frac{20 \text{ ft.} \times 12 \text{ ins.} \times 7}{16 \times 5.25} =$ 20 ⅜-in. round bars per band.

If it is assumed that the stresses in the center of the slab are approximately but one-half of those at the column, but one-half the amount of steel will be needed. There actually is .252 and $\frac{.608}{2} = .304$ are needed; but as the bars are crossing each other in the center of the span and as tests of expanded metal seem to prove that the concrete develops higher resisting powers when reinforced with metal in the form of a mesh, this may perhaps stand as it is.

The deflection by this method, using $E_c = 3{,}000{,}000$ equals $\frac{15 \ 2.08 \text{ lbs.} \times 240^4}{512 \ 3{,}000{,}000 \times 7^3} = .196$ in.— a little more than 3/16 in.

The size of the column head of course will serve to modify more or less the results obtained by any method, and the writer can think of no better way than to make the diameter of the cap of such a size that the vertical sheer per square inch at its perimeter will not exceed 80 lbs. per sq. in.

(4) Mensch: The writer has not attempted to analyze this method and is simply going to copy the results given in the tables on page 56 without demonstration.

Thickness of slab = 8 ins.

Area of steel in strip per foot of width, 0.75 sq. in.

Width of strip, 7 ft.

Size of column capital, 4 ft. 6 ins.

Weight of steel per sq. ft., 5.3 lbs.

Total weight in panel = 20 ft. × 20 ft. × 5.3 lbs. = 2,120 lbs.

The percentage of steel per ft. width = 0.89 of 1 per cent.

Mensch states that the rods running in the direction of the columns should extend into the adjoining panel $0.12L$, and those running diagonally should extend $0.16L$ beyond the column center.

(5) Turner's Method: Let $M = \frac{W\,L}{50}$ and f_s = 13,000 lbs. per sq. in.

All other quantities to have the same index as in previous cases.

$L = 20$ ft.

w = live load = 200 lbs. per sq. ft.

w_1 = dead load = 8-in. slab = 100 lbs. per sq. ft.

(1) $W = (200 + 100) \times 20^2 = 120{,}000$ lbs.

(2) $M = \frac{120{,}000 \times 20 \times 12}{50} = 576{,}000$ in. lbs.

(3) $\Sigma A_s = \frac{576{,}000}{.86 \times 7 \times 13000} = 7.38$ sq. ins.

The area of a ⅜-in. round bar = .1106.

(4) $\frac{7.38}{.1106} = 66.7$ ⅜-in. round bars, say 68.

(5) Number of bars in band $= \frac{68}{4} = 17.$

If $f_s = 16{,}000$ lbs.

$A_s = \frac{576{,}000}{.86 \times 7 \times 16000} = 6$ sq. ins. nearly.

$\frac{6}{.1106} = 54.2$ bars ⅜ in. diameter.

$\frac{54.2}{4} = 13.55$ bars, say 14 bars in each band

(6) Width of band $y = \frac{7 \times 20}{16} = 8$ ft. 9 ins.

Mr. Turner does not state what rule he uses to obtain the size of his column capitals.

The deflection of the slab by Turner's method $\Delta = \frac{1}{7000} \times \frac{(60) \times (20)^3}{(4 \times 17 \times .1106)\ (7)^2} =$ .19, about 3/16 in.

(6) MacMillan Method: Let w = live load per sq. ft.

Let w_1 = dead load per sq. ft.

Let $w + w_1 \times L \times B = W$ = total load on pier.

Let L and B = length and breadth of panel respectively in feet.

When panel is square, $L = B$.

When panel is rectangular, L is greater than B and must be used in getting the bending moment.

Let f_s = tension in steel = 16,000 lbs. per sq. in.

Let d = effective depth of slab.

Let jd = arm of forces = .86.

Let A_s = area steel = total number of bars in panel × area of single bar.

Let y = width of bands of steel = $7/16L$ approximately.

Let v = fibre stress of concrete in shear = 80 lbs.

Let T = total thickness of slab.

Then (1) $W = (w + w_1) \times L \times B.$

(2) $M = \frac{W \times L \times 12}{25}$

(3) $\Sigma A_s = \frac{M}{jd \times f_s}$

(4) Number of bars $= \frac{\Sigma A_s}{\text{Area of bar used.}}$

(5) Number of bars in band $= \frac{\text{total number}}{4}$

(6) Diameter of cap $= \frac{W}{\pi \times T \times V}$

(7) $y = \frac{7L}{16}$

jd will vary according to $\frac{E_s}{E_c}$ and to the percentage of steel used, but .86 is a good average. It will not be found advisable to make T less than 7 ins. regardless of load on account of the difficulty found in embedding the bars in concrete.

To illustrate the case we have been using,

Let $L = 20$ ft.

Let $W = 200$ lbs.

Let $w_1 = 100$ lbs. for 8-in. concrete slab.

Let $d = 7$ ins.

Let $T = 8$ ins.

(1) $W = (200 + 100) \times 20 \times 20 = 120{,}000$ lbs.

(2) $M = \frac{120{,}000 \times 20 \text{ ft.} \times 12 \text{ ins.}}{25} = 1{,}152{,}000$ in. lbs.

(3) $\Sigma A_s = \frac{1{,}152{,}000}{.86 \times 7 \times 16{,}000} = 11.95$ sq. ins.

The area of a ½-in. round bar = .196.

(4) $\frac{11.96}{.196} = 61$ bars.

(5) Number of bars in band $= \frac{61}{4} = 15.25,$ say 16 each way diagonally and 15 each way straight.

(6) Diameter of column cap $= \frac{120{,}000}{3.1416 \times 8 \times 80} = 59.6$ ins.

(7) Width of band $y = \frac{7 \times 20}{15} = 8$ ft. 9 ins.

It will be desirable to get the depth of cap at the junction with column by solving for depth at that point, having shear and diameter of column fixed.

The radial bars and rings have generally been made of 1-in. round rods, the rings being lapped at the ends about 2 ft. and U-bolted together or else welded. These rings are placed so that they bring the slab bars up near the top of the slab at the column.

In general $f_s = 16{,}000$ has been used for stress in tension with plain round bars. The percentage of steel has been kept below .5 per cent for a single layer of bars. The wall beams are designed to carry ¼ of the panel loads and if necessary the columns are calculated for stresses caused by eccentric loading. The wall panels are made the same as the interior panels, and where the holes of a reasonable size occur, they have been made in the slab without hesitation.

The deflections occurring have never been calculated, but the tests made indicate that they are quite insignificant. This method has been used by the writer in connection with the following work by various engineers and architects: In designing the floors and roof for the Congress Building at Portland, Me.; for a fire station at Weston, Mass.; for the floors of the East Boston Terminal Refrigerating Co.; for a storage building for the Pierce Arrow Motor Car Co. at Buffalo, N. Y.; for a storage building for the Hood Rubber Co. at Watertown, Mass.; and with a slight modification for the Winchester Repeating Arms Co.'s new loading buildings at New Haven, Conn. With the exception of the East Boston Terminal Refrigerating Co.'s floors, all of these buildings were built by the Aberthaw Construction Co.

It would seem that if the writer's interpretation of Turneaure and Nauer's diagrams and descriptions are correct, the results are extremely heavy—much more so than any existing work would lead one to believe necessary.

Only recently in fact the writer agreed to test a slab in the Refining Building for the Hood Rubber Co. with a live load of 450 lbs. per sq. ft. This slab was 9 ins. thick and the reinforcement consisted of ½-in. round bars 7 ins. on centers. Columns were spaced 20 ft. on centers. The slab was cast 8 ins. thick, and later an inch of finish was put on. A box without a bottom whose sides were long enough to span from column center to center and 5 ft. high was built, resting on the concrete slab and inclosing one bay. On the center of this bay a target was attached to the under side of the slab so that readings for deflections might be taken. The box was then filled with sand. At a load of 200 lbs. per sq. ft. no deflection of the slab could be measured. At this point, as the slab was cast in cold weather and was quite green, it was decided to put some shores under the panel and then continue the loading to the required amount. Later, when the concrete had a little more chance to season—that is, in February, 88 days after casting—the shores were taken out and the whole load was allowed to come on the slab.

The deflection under the total load was 5/64 in. This is about 1/3000 of the span with over twice the figured live load superimposed. This certainly does not seem to indicate that as thick a slab or as much steel as this method seems to demand was necessary.

A table giving the weights of steel required by the different methods may be of interest and will be given here:

Method.	Thickness of slab. ins.	Fiber stress lbs. per sq. in. in steel.	Lbs. steel in panel.	Deflection. in.
1. Cantilever	8	16,000	2,189	.
2. Turneaure and Nauer	12	16,000	1,931	.
3. Grashof	8	16,000	784	.195
4. Mensch	8	16,000	2,120	.
5. Turner, a	8	16,000	549	....
5. Turner, b	8	13,000	718	.19
6. MacMillan	8	16,000	1,084	.
Average (Not including 5b.)	8.66	16,000	1,463	.

A few points worth mention are noticeable in this summary: First, the similarity of methods 1, 2, and 4 in regard to amount of steel. This holds true of methods 3 and 5*b* also. Secondly, the marked difference in thickness of slab required by the second method. Thirdly, the remarkable closeness in deflections obtained in 3 and 5*b*.

Regarding the merits or demerits of the different methods, the writer can say little except that the floors designed by his method have been low in cost, have shown remarkable

powers of resisting abuse, have stood tests of twice the live load over an entire bay not only without signs of failure but with such trivial deflection that one is led to believe that the constituent materials are far from being stressed inordinately.

It may be well to call attention to one other point that may give trouble to the designer of this system; that is the ratio of length to breadth of panel. It will be apparent that as the greatest length is used in getting the bending moment, the depth of the slab and the amount of steel increase rapidly with the increase of length and the variation of stresses will become very uncertain. In consequence it would seem that nearly square slabs were desirable and that an increase of length over breadth of more than 25 per cent was perhaps not economical practice.

The most economical spans would seem to be from 16 ft. to 24 ft. For shorter spans the cost of columns runs up pretty fast. A heavy floor load seems to show greater relative economy than a light one. Where speed of erection is a desideratum, the flat floor slab with its absence of beams is far ahead of any other method.

The wood forms can be built into panels and laid in place by rough form builders, carpenters being used only for shoring and leveling; and there being no beams to be taken care of, little if any of the sawing and fitting necessary when they are part of the design has to be done. The bent steel is reduced to a minimum, being confined almost entirely to the columns, distributing rings and wall beams. The bars themselves, while fairly long, are generally quite small in section and easily handled, and will readily sag of their own weight to the required position at the center of the span without having to be held down.

The joints where the day's concreting is stopped are infrequent, and the danger of temperature or shrinkage cracks with such a net work of steel is minimized.

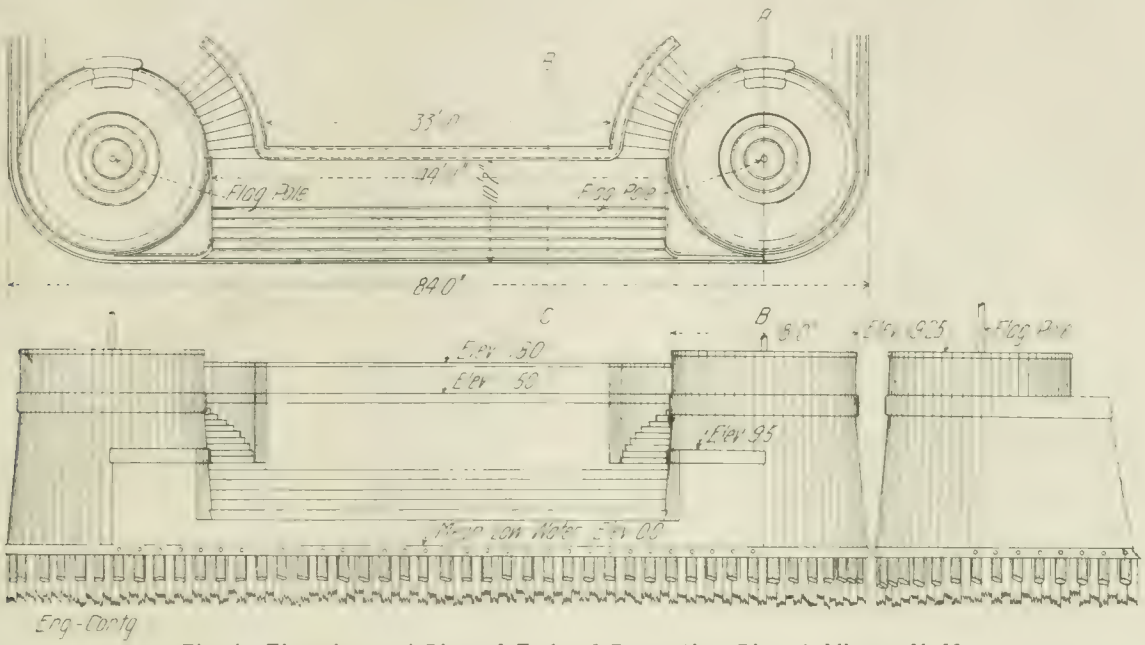

Fig. 1—Elevation and Plan of Ends of Recreation Pier at Albany, N. Y.

Structural Features of New Concrete Recreation Pier at Albany, N. Y.

Attention to water front improvements of exceptionally attractive character is being given by a number of cities located on inland rivers. This is an opportunity which American cities have quite generally neglected in the past and interest naturally attaches to the designs and details of specific examples. The accompanying illustrations show such an example. This is the new recreation and boat pier being constructed at Albany, N. Y., after designs by Mr. Walter Melius, City Engineer.

The new pier replaces an old pier and is located parallel with the city's water front and separated from the shore by a stretch of water known as Albany Basin. State Street, of the city, extended, would intersect the pier about midway of its length and the pier is connected with the shore by a bridge on the line of that street. In plan the new pier is a rectangle 898 ft. long and 84 ft. wide; its length is 100 ft. less than that of the old pier and this 100 ft. of old pier will be removed. The pier runs north and south and there are boat landings at both ends, and four others on the river side of the pier. The tops of the pier will be concrete pavement with grass plats, shelters and drinking fountains at intervals and a lavatory, all of concrete. An idea of the character of the ornamental design throughout is given by Figs. 1, 2 and 3, which show plans and sections of the boat-landings at the ends of the pier. The boat-landings on the river side of the pier are generally similar in design.

Aside from the boat-landings the pier construction consists of a plain concrete bulkhead wall supported on piles and filled behind with earth. Figure 4 is a plan and Figs. 5, 6 and 7 are sections of the bulkhead wall, showing different features of the construction. As will be seen the toe of the wall is supported on a row of round piles cut off at mean low water level and having waling on both sides. Back of the inside waling and close

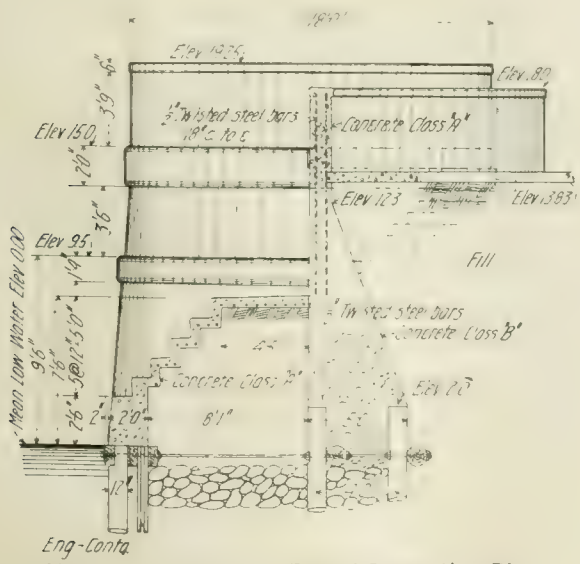

Fig. 2—Section B C of End of Recreation Pier.

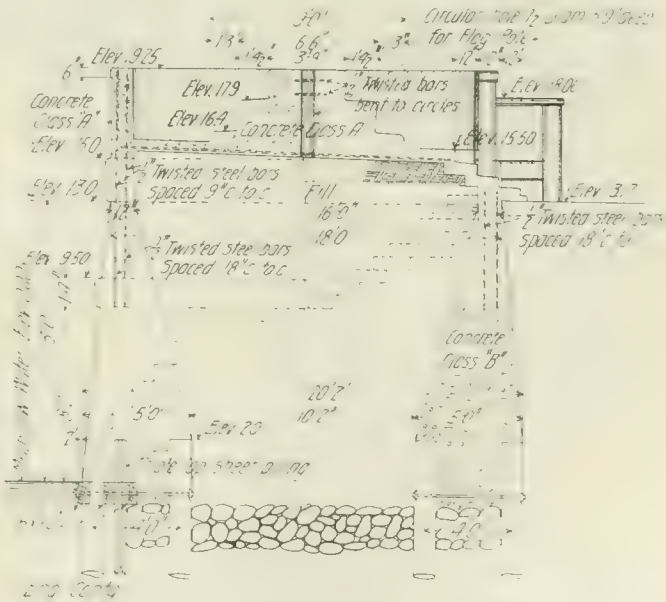

Fig. 3—Section A B of End of Recreation Pier.

against it is a row of sheet piling driven to a depth of 22 ft. below mean low water level. Each sheet pile consists of three 2-in. planks not less than 8 ins. wide, nailed together to form a tongue and groove. A waling timber extends along the top of the sheeting at the back, and, as will be noted, the sheeting, waling timbers and front bearing piles are drawn up tight at the top by a 1-in. bolt at every bearing pile. It will also be noted that every other front bearing pile is tied back to its opposite bearing pile under the heel of the wall. The system of further anchorage of the wall bearing piling consists of a row of anchor piles and waling and of a series of concrete anchor blocks; these are shown clearly by Figs. 4, 5 and 6.

The wall construction pr per is also shown by Figs. 4 to 7. As will be seen, the wall is of gravity section with both front and rear face battered and having at the back buttresses every 15 ft. The toes of these buttresses embrace the tops of the anchor piles. Structurally, the wall is divided into sections 40 ft. long, separated by expansion joints. An interesting detail is the provision of a ladder recess at each expansion joint which effectually conceals the joint. Figure 7 shows the construction of this joint. The coping as shown by Figs. 5 and 6 is separately molded and placed, being anchored to the wall proper by twisted burs 18 ins. apart. The illustrations also show the location of and manner of attaching ring bolts and snubbing posts.

Two grades of concrete will be used: Class A for steps, coping on pier walls and other places where the sections are small, and, Class B for the main body of the work. The proportions are the same for both classes, viz. 1 bag of cement, 3 cu. ft. of sand and 5 cu. ft. of broken limestone, but 1-in. stone will be the maximum size for Class A concrete while 1½-in. stone may be used for Class B, and in addition it may contain embedded rubble stone if they are not larger than 1 cu. ft. and are not placed closer than 4 ins. to each other or than 9 ins. to faces of work. It is interesting to note that the engineer specifies that a "bag of cement shall contain 94 lbs. net of cement," that "1 cu. ft. of cement shall be assumed to weigh 100 lbs.," and makes the bag the unit of measurement in proportioning. According to the specifications, then, a bag of cement is 0.94 cu. ft. of cement and the proportions as given above are by volume 0.94 : 3 : 5, not 1 : 3 : 5. In this same connection the specifications state: "For each batch the cement shall be weighed and the sand, crushed limestone and water separately measured before placing in the mixer."

The specifications require the concrete to be deposited in 6-in. layers and compacted by spading and ramming until the water comes to the surface. The finishing will consist in spading and in drawing back the stone from the forms so as to give a surface of fine material.

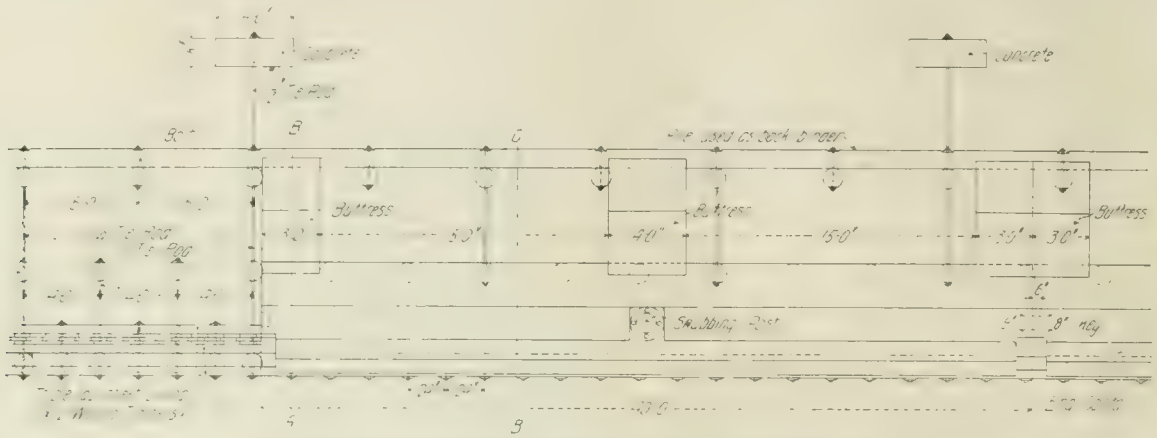

Fig. 4—Plan of Wall Construction for Recreation Pier.

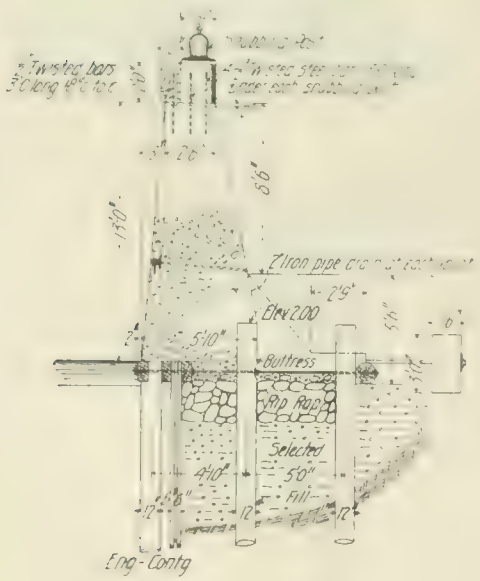

Fig. 5—Section B C of Recreation Pier Wall.

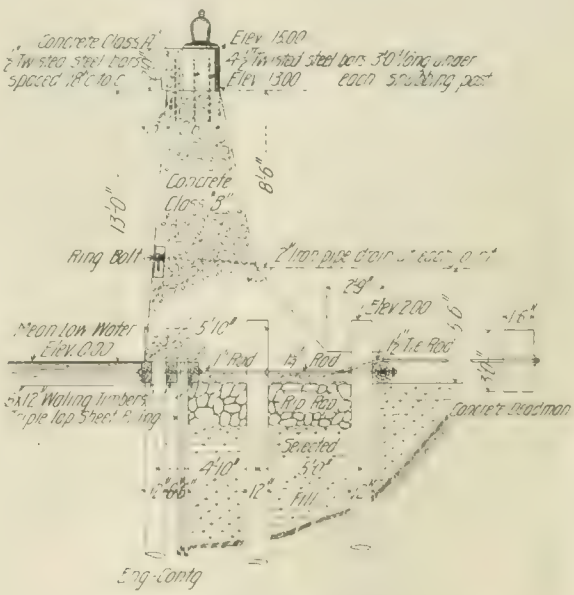

Fig. 6—Section A B of Recreation Pier Wall.

Cornelius Vanderbilt was elected to the board of directors of the Missouri Pacific, and Kingdon Gould to the board of the St. Louis, Iron Mountain & Southern, at the annual stockholders' meeting in St. Louis. Mr. Vanderbilt succeeds H. B. Henson of New York and Mr. Gould takes the place of A. G. Cochran of St. Louis. The Missouri Pacific board is constituted as follows: Geo. J. Gould, Edw. T. Jeffery, Fred T. Gates, Kingdon Gould, Cornelius Vanderbilt, R. M. Gallaway, C. S. Clarke, O. L. Garrison, W. K. Bixby, M. C. Markham, C. H. Middleton, S. B. Pryor and S. H. Kilgore. Eighty-five per cent of the stock was voted. The Iron Mountain board is constituted as follows: Geo. J. Gould, Kingdon Gould, Edw. T. Jeffery, J. J. Slocum, Benj. Nicoll, John T. Terry, C. S. Clarke, B. F. Edwards, C. A. Pratt, M. C. Markham, C. H. Middleton, G. A. A. Deane and J. G. Hollenbeck. Ninety per cent of the stock was voted. Both boards adjourned to meet Friday in New York. No changes will be made among the active executive officers.

The directors of the Gould lines, Missouri Pacific and St. Louis, Iron Mountain & Southern met last Friday at the New York offices and elected officers for the ensuing year. Vice President C. S. Clarke, M. C. Markham and C. H. Middleton, assistants to the vice president, and General Purchasing Agent S. F. Pryor were present at the meeting from St. Louis. E. C. Simmons of St. Louis was elected a member of the Iron Mountain board and Kingdon Gould, son of President George Gould, was likewise elected a member of the board and the executive committee. Cornelius Vanderbilt, who was elected a director of the Missouri Pacific at the St. Louis meeting of stockholders on Tuesday, was placed on the executive committee of that company. Fred T. Gates represents the Rockefeller interests on that committee. General Purchasing Agent Pryor of St. Louis was elected on Tuesday a member of the Missouri Pacific board. Vice President Clarke was elected a member of the executive committee. B. F. Edwards of the Bank of Commerce and C. S. Clarke were elected members of the Iron Mountain board. The organization was perfected as follows:

Missouri Pacific—Directors: George J. Gould, E. T. Jeffery, Fred T. Gates, Kingdon Gould, Cornelius Vanderbilt, R. M. Gallaway, Edwin Gould, C. S. Clarke, O. L. Garrison, W. K. Bixby, J. J. Slocum, Howard Gould, S. F. Pryor; executive committee: George J. Gould, E. T. Jeffery, Fred T. Gates, Cornelius Vanderbilt, Kingdon Gould, C. S. Clarke J. J. Slocum. St. Louis, Iron Mountain & Southern—Directors: George J. Gould, E. T. Jeffery, J. J. Slocum, Kingdon Gould, Benjamin Nicoll, John T. Terry, C. S. Clarke, B. F. Edwards, C. S. Whelen, Jay Gould, H. B. Henson, E. C. Simmons, Howard Gould; executive committee: George J. Gould, E. T. Jeffery, Kingdon Gould, J. J. Slocum, Jay Gould, John Terry. Officers for both companies were selected as follows: George J. Gould, president, New York; C. S. Clarke, first vice president, St. Louis; Martin L. Clardy, vice president, and general solicitor, St. Louis; J. M. Johnson, vice president in charge of traffic, St. Louis; Kingdon Gould, vice president, New York; O. B. Huntsman, vice president, New York; Frank Jay Gould, vice president, New York; A. H. Calef, secretary and treasurer, New York; F. M. Hickman, local treasurer, St. Louis; F. W. Irland, assistant secretary, St. Louis.

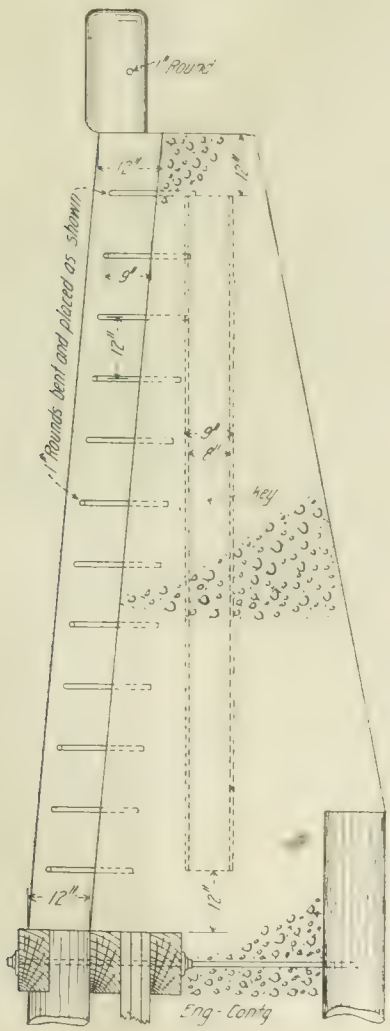

Fig. 7—Section of Pier Wall at Expansion Joint.

An investigation regarding the use of granolithic and other floors in manufacturing plants has been recently undertaken by the Aberthaw Construction Co., Boston, Mass. The results will be embodied in a special report which is now in process of preparation. It is understood that the above named company will be very glad to receive information from various sources regarding experience with granolithic floors as to cost, durability, hygienic effect, and general convenience.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Some Records of Work With a Scraper Bucket Excavator On the New York Barge Canal.

The following records relate to scraper bucket excavation work on the New York Barge Canal contract of the Thomas Crimmins Contracting Co. of New York, N. Y. The section of the canal on which the work recorded is located is in that part of New York state so famous for Medina sandstone and this sandstone is covered with a very hard material composed of sand, loam and clay which is widely known as "red horse." This "red horse" is so tightly compacted that it can be picked only with the greatest difficulty. Specifically the material excavated in the work recorded consists of about 1 ft. of silt over the whole prism of the canal and of "red horse" underneath or, say, of about 10 per cent mud and 90 per cent hard material.

The excavator used is shown by the accompanying illustration. It is a Class C, Lidgerwood-Crawford scraper bucket excavator built by the Lidgerwood Manufacturing Co., Chicago, Ill. Briefly, the excavator consists of an upper frame mounted on a turntable which rides on a lower frame carried on trucks. From the upper frame there rises an A-frame thoroughly guyed, and to its front end is hinged a boom, the outer end of which is rigged with topping lines to the A-frame. The upper frame carries the power plant which consists of a double-cylinder, double-friction drum main engine, a 90 hp. Scotch boiler, swinging engine, boom winch, water tanks, pump and accessories. A notable feature of this plant is the convenience and ease of its operation. The steam, reverse and brakes are all controlled by one lever. The frictions on main engine and the swinging engine are operated from the front of the engine platform by the "Crawford" pneumatic control. The exertion required to handle the frictions and swinging engine by this compressed air control is confined to moving a lever 8 ins. long, forward and back, a total distance of 8 ins. When this 8-in. lever is thrown forward the bucket is filling and when thrown back the bucket is hoisting. The moving of a lever on another similar controller starts the swinging engine the moment the bucket is clear of the ground. It is then conveyed to a point where the dumping is performed by the operator removing his foot from the brake of the lower drum. Another convenient feature is the connection of the pump with a suction pipe which runs down through the center spider of the turn table and which has a ball and socket joint. The boom in the machine illustrated is 85 ft. long; the bucket is a 2-cu. yd. Page bucket. The total weight of the machine is 110 tons.

The excavator is operated on a steel rail and timber track built in 15 ft. sections. The excavator grades its own roadbed and shifts the 15 ft. sections of track from rear to front as needed.

Table I is a record of work with the machine illustrated which covers the period from March 25 to April 14, 1909, inclusive. The excavator was operated three 8-hour shifts per day as follows: Shift 1, 4 a. m. to 12 noon; shift 2, 12 noon to 8 p. m.; shift 3, 8 p. m. to 4 p. m. On each shift there was the following gang: 1 operator, 1 fireman, 1 foreman and 4 pit laborers, or 7 men in all on the excavator proper. The duties of the several men were as follows: The operator had the entire operation of the excavator; the fireman tended the fire, oiled the working parts and kept an eye on the machinery for his operator. The foreman had complete charge and directed the movements of the machine. His most important function, however, was to direct the bucket. This he did by standing in the cut and signalling the runner when and how deep to dig. It was found that directing the work in this manner saved much time and expense; there was no excavation below grade nor was material above grade left on the banks and bottom. The 4 laborers attended to setting the track, put on coal and kept the lights in shape.

Fig. 1—View of Lidgerwood-Crawford Scraper Bucket Excavator at Work on New York Barge Canal.

TABLE V.—RECORD OF '21 DAYS' OPERATION OF A SCRAPER BUCKET EXCAVATOR ON THE NEW YORK BARGE CANAL.

	Distance moved, ft.	Yardage handled, cu. yds.	Hours time lost out of 24 hrs.
March 25	60	817.5	2 (delay)
March 26	90	1,179	.....
March 27	60	786	11 "
March 28	75	982.5	4 "
March 29	90	1,179	1 "
March 30	95	1,252.36	1½ "
March 31	75	982.5	1 "
April 1	75	982.5	3½ "
April 2	110	1,467.2	.....
April 3	90	1,179	.....
April 4	45	589.5	9½ "
April 5	80	1,048	4 "
April 6	105	1,260	.....
April 7	75	900	.....
April 8	105	1,260	.....
April 9	90	1,080	1½ "
April 10	30	360	14 "
April 11	15	180	16 "
April 12	120	1,440	.....
April 13	90	1,080	.....
April 14	60	720	.....

The 7 men mentioned were all the men em-

ployed with the exception of two "dinkey" runners who brought up coal and water to the machine. They worked from 4 o'clock in the morning till 8 o'clock at night. Each shift took water three times, stopping 20 mins. each time for this purpose and while the machine was standing idle for water the coal was put on. The machine operated when there was no break-down, 20 hrs. out of the 24-hrs. The coal used was a medium class bituminous, and the machine required about 1 ton per shift.

Referring to the table it will be seen that the machine worked 21 days, advanced 1,635 ft. and excavated 19,725 cu. yds. Of the third column, recording delays, it may be noted that all repairs which could be postponed till then were made during the shift from 8 p. m. to 4 a. m. Out of the 69 hrs. lost time, 46 hrs. were for broken shafts. These were broken on the drag line drum and were chiefly the fault of the operators. The remaining 23 hrs. lost time were because of cable and bucket breaks.

The information contained in the table and most of the other data given have been sent us by Geo. S. Taylor, The Crimmins Contracting Co., Knowlesville, N. Y., who also writes as follows concerning the excavator:

The great advantage of these machines rests in their flexibility. They revolve upon a track set upon dolly wheels making a complete revolution from right to left. In addition to this their power is increased by their great reach. Their boom, which is a firmly constructed framework, can be lowered to give a radius of 89 ft. The saving is at once seen. Material can be picked up out of a cut and dumped 89 ft. on either side of the machine, which makes a total distance of 178 ft. This often does away with the handling of material twice as by dump cars or conveyors. However, if it is necessary to haul material from her it is as readily loaded into cars as by a steam shovel. Furthermore, from this advantageous reach the hauling track may be either on a level or higher or may be kept close or at a distance from the machine according to whatever conditions require.

These powers give the machine great advances over other shovels. For example, in all drainage work, such as canal digging, the machine can be placed in the bottom of the cut and excavating the material, deposit it on either side. Likewise if it is undesirable to set the excavator in the cut, when there is quicksand or water to contend with she may be kept up on dry land and be worked to almost as great an advantage.

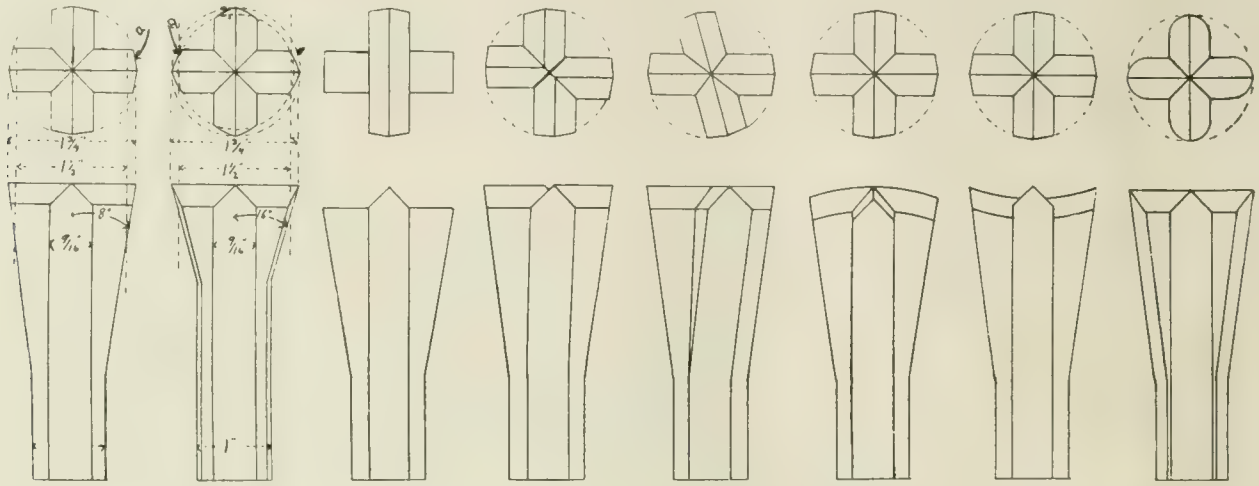

Fig. 1. Fig. 2. Fig. 3. Fig. 4. Fig. 5. Fig. 6. Fig. 7. Fig. 8.

Shapes of Drill Bits in Use with Comments on Efficiency and on Sharpening and Tempering.*

The success of almost every drilling operation depends on the selection and treatment of the bits. Too much attention cannot be given this important part of the work. If the bits have been properly formed, sharpened, and tempered for the work, and if they are changed just as soon as their edges and gauges are worn, the result will be found to be most economical. The power-drill sharpener has removed many of the shortcomings attendant upon the hand-sharpening process, with the result that where these machines are used it is possible to accomplish from 25 to 100% more drilling than under the old methods. The reasons for this are that the power sharpener turns out a much better bit. The saving in the blacksmith's wages should be a secondary consideration. The superior quality of the bits made in a machine will increase the capacity of the drilling machines sufficient to pay handsome dividends on the cost of the power sharpener.

For the guidance of those unfamiliar with the forms of drill-bits used in the different sections, I have prepared a few drawings of those in use. Fig. 1 represents the square cross-bit adopted as the standard for American mining practice. It is made from either round, octagon, or cruciform steel. In the copper mines of Michigan, it is usually made of a round steel. In the iron mines of Michigan and Minnesota and wherever this form of bit is used east of the Rocky Mountains, octagon steel is preferred, but in the Rocky Mountain and Pacific States cruciform steel is used. The reason for the adoption of this form of bit as a standard will be appreciated when the three requirements of a rock-drill bit are recalled. These are, "to chisel out a hole in the rock," "to keep this hole round and free from rifles," and "to mud freely." There is really a fourth requirement, which is "to do as much drilling as possible before being resharpened."

The different kinds of rock to be drilled affect the wear of the bit. Very hard rock will blunt the chisel and reaming edges. The softer rocks do not blunt these edges, but wear the outer sides so that it loses its gauge and size, still appearing to be quite sharp. For this reason a bit that is made with a square edge and a clearance angle of 8 deg. will drill about four times as long in soft rock as a bit with round edges and a clearance angle of 16 deg., before being reduced to the size of the next bit that is to follow. Referring to Fig. 1 and Fig. 2, the latter being a round-edge bit with a clearance angle of 16 deg., it will be seen that in Fig. 1 the corners of the bit at the

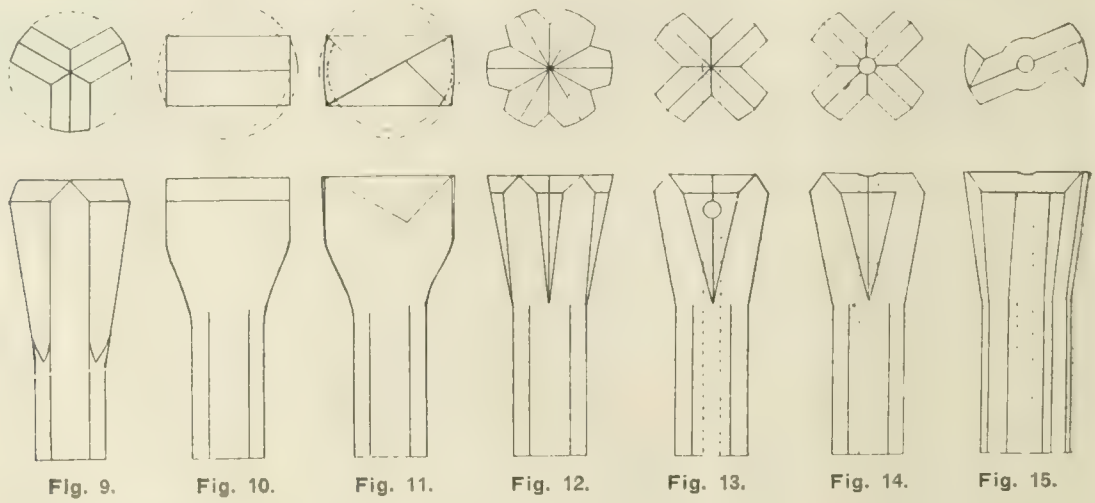

Fig. 9. Fig. 10. Fig. 11. Fig. 12. Fig. 13. Fig. 14. Fig. 15.

*From an article by T. H. Proske in "Mining and Scientific Press" for March 5, 1910.

base of the bevel describe a circle that is equal to the circle that the chisel edges describe. This is as it should be, as it is impossible for the chisel edge to cut out all of the rock. The reaming edge, which is that part of the bit extending from the chisel edge to the base of the bevel, marked "A" in both Fig. 1 and Fig. 2, must ream the outer edge of the hole and keep it round and free from rifles. In Fig. 2 it will be noted that the circle described by the corners of the bit at the base of the bevel is much smaller than the circle described by the chisel edges. This causes an excess of wear on the corners of the chisel edges, the bit rapidly loses its guage, as well as it efficiency, and it is almost impossible to keep the hole round. Rifles form, and these cause the rotation parts of the drilling machine to break, often resulting in the loss of the hole.

Fig. 16. Fig. 17. Fig. 18. Fig. 19. Fig. 20.

The angle of the bevel of the face of the bit has to do with its life as well as with the property of "mudding" freely. It is generally accepted that if this angle be 90 deg. it gives strength and permits the bit to "mud" or throw back the cuttings from the face of the bit when the drill is pointed downward. Bits made like Fig. 19 and Fig. 20 will not "mud" freely. Another reason why bits such as is shown in Fig. 1 are preferable to those illustrated by Fig. 2, is that having a long wing they are stronger and will not break so readily as does a short bit.

The Simmons bit, used at the Champion mine at Beacon, Mich., is shown in Fig. 3. In it two of the wings are devoted entirely to reaming and keeping the hole round and free from rifles. Some tests made several years ago in jasper, the hardest rock found in the Champion mine, using a 2¾-in. Rand drill with 60-lb. air pressure at the compressor, showed an average speed per minute of 0.28 in. for the ordinary cross-bit, and 0.659 in. for the Simmons bit. Both forms were hand-sharpened.

The Brunton bit, the invention of the well known mining engineer, D. W. Brunton, is extensively used in Idaho and Montana. It is shown in Fig. 4. The object of this bit is to obtain the advantages of the X-bit without the attendant difficulties of re-sharpening. With this bit, as in the case of the X-bit, the piston must revolve a half turn before the cutting edges will strike in the same place a second time. It is as easily re-sharpened as the regular square cross-bit. The X-bit itself is shown in Fig. 5. Since the invention of power-drill sharpening machines, this bit is fast disappearing. The reason will be understood when a comparison is made with the regular square cross-bit, as made with the power-sharpener, and the cross-bits as they are re-sharpened by hand, shown in Fig. 18, Fig. 19, and Fig. 20. The X-bit is designed to prevent rifles. This the hand-sharpened cross-bit would not do, but the machine-sharpened cross-bit effectually accomplishes. Figure 6 shows what is commonly termed the high-centre bit. This was for many years accepted as the proper form. It is still used in the mines of Cornwall and where Cornish customs prevail. Since the introduction of hammer-drills this bit is again finding favor. It is of especial advantage in starting a hole, the high centre immediately making an impression on the rock, whereas the square-faced bit requires a flat face for ready starting. For a starting bit in hammer machines it has no equal. Here, however, its advantages over the square bit end. Used as a bit to follow the starter, it is liable to follow slips and seams in the rock, causing crooked holes, which are sometimes lost before being finished. This the square bit will not do. Figure 7 shows a bit where the corners are in advance of the centre. This is a fast cutting bit. The corners break up the rock in advance of the centre and leave little for the centre to do; this causes the corners to wear fast, but still not to excess when it is considered that they do most of the work. This drill will not follow slips and seams, will drill a round hole, and is easy on the drilling machine. The weak point of this form is that the leverage is so great on the corners that they are liable to break off if tempered too hard. Figure 8 shows the round-edge bit, which is a favorite with some. In soft rock this is good, but in hard rock it permits rifles to form in the hole because there are no reaming edges.

The Y-bit shown in Fig. 9 gives the advantage of plenty of room for the cuttings to essape. It is, however, quite difficult to make and re-sharpen by hand. With the power-sharpener it can be made as easily as any other form. Figure 10 shows the 'bull' bit in use in the lead and zinc mines of the Joplin, Missouri, district, before the introduction of the power-sharpener. The extreme hardness of the limestone and flint in the sheet-ground of that district, caused the ordinary cross-bit as made by hand to wear too fast. This dull bull-bit therefore had to be adopted. Drilling here was not a matter of cutting the rock, but of shattering it by impact. The power-sharpener has changed all this, and the American standard cross-bit as made in these machines is now used. As a result the capacity of the drills has been materially increased. In mines where hand-sharpening is still done the bull-bit is yet in use. Figure 11 shows the Z-bit used in hand-sharpening in the south-east Missouri lead district. This bit is also used quite extensively in Germany. In both places, however, the advantage of the standard square-cross-bit as made with the power-sharpener is fast causing it to be displaced.

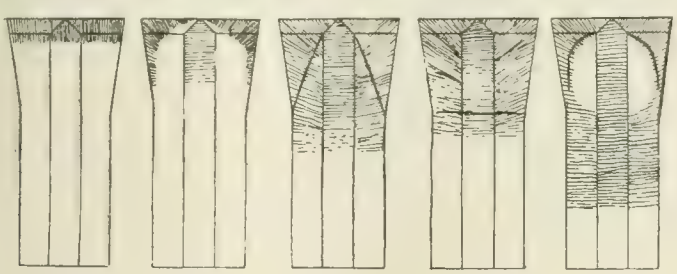

Fig. 21. Fig. 22. Fig. 23. Fig. 24. Fig. 25.

Figure 12 shows the 'six-wing rosette' bit as made in the power-sharpener in use at the Penarroya mines in Spain. It is used in hammer drills only. Of all the rosette forms of bit this has been found to be the most satisfactory. Figure 13 shows the square cross-bits when made up for hammer drills where a hole for the introduction of air or water to remove the cuttings apexes at a point back from the bevel of the bit in one of the recesses between the wings. Figure 14 shows the same form where the hole ends in the centre of the cross of the cutting edges. This form of bit is extensively used. Its faults are that a core is formed by this hole; this core fills the hole, and causes a stoppage of air or water. These cores have been known to become as much as 8 in. long, and are quite difficult to remove. To clear them away the core must be burned out by heating the steel the full length of the core in a slow fire; a sometimes slow and tedious process. This difficulty is entirely overcome by the use of the bit shown in Fig. 13, The Z-bit, Fig. 15, is extensively used in Germany. In hammer drilling machines, the steel is formed in bars having a Z shape. While I show this bar straight, it is usually twisted to form a spiral. It is an easy matter to form a Z-bit on the end of such a bar. The results obtained are excellent. Holes to a depth of 16 ft. horizontal have been drilled with this form of steel. The spiral draws out the cuttings much the same as an auger. Figure 16 to Fig. 20 are given to show the evolution of the cross-bit where hand-sharpening is employed. There are two system of hand-sharpening. One is known as the set-hammer system. In it the steel is hammered by placing a set-hammer on the bevels and driving the steel back. The results of this method are illustrated in Fig. 16 to Fig. 19. Fig. 16 shows a bit made by cutting the bevels with a chisel and is as it should be in form. Figure 17 shows this bit after about the third sharpening. Figure 18 is the same bit after about the sixth sharpening, and Fig. 19 is the same bit at about the time that the original cross that was formed on the bar of octagon steel has become exhausted. The other system of hand-sharpening is known as the fuller and dollie system. By this system the stock is first drawn sharp at the corners as shown in Fig. 20 with the fuller, after which it should be set back in the centre with the dollie. Unfortunately the man swinging the sledge hammer gets tired before the bit is set back enough, the result is that the bit, partly finished, is left as shown in Fig. 20. It is because the power-sharpener has the staying power, and because it readily finishes a bit perfectly, that inferior bits like these are not to be found where machine sharpening is employed.

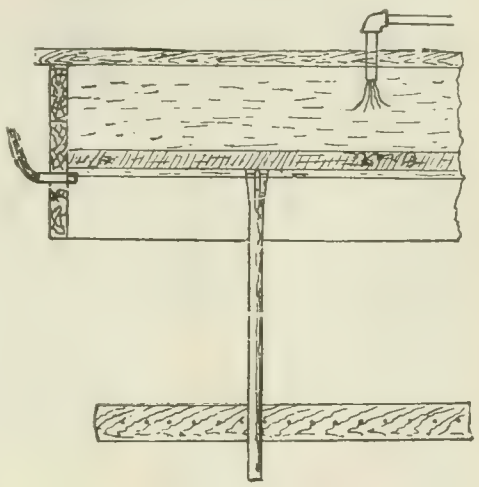

Fig. 26.

After a bit has been forged, it should be properly tempered as in Fig. 21. Figure 22 shows the result of the common method of tempering. The centre of the bit is soft, while the corners are hard. When the bit is immersed in the water about an inch the large mass of metal in the centre cools more slowly than the corners since the corners have three sides exposed to the water. Perhaps the centre had not chilled at all when the bit is withdrawn for annealing, and the final result is a soft-centre bit, which will flatten and retard the work of drilling. Figure 23 and Fig. 24 show the result of trying to temper the bit with the forging heat, by plunging the

whole bit into the water as soon as it is sharpened. The line of tension induced by cooling is indicated. At this place the drill will break. Figure 25 shows the checking caused by first chilling the steel back of the bit and then plunging with the forging heat.

For the purpose of tempering a bit as shown in Fig. 21 a tank should be provided, such as shown in section in Fig. 26. This should be about 12 in. deep by 12 wide, and of sufficient length to accommodate whatever number of drills are to be sharpened in a day with the machine. The water inlet should be at the bottom, and the outlet should be placed about ¾ in. above a grate which itself should be about 8 in. above the bottom. This permits the bit to be immersed to a depth of about ¾ in. With a temperating tank of this construction the bit can be hardened to any desired degree. This depends on the temperature of the bit when placed on the grate. It is essential that the drill stand in a vertical position. To lean either way would cause it to harden to a greater depth on one side than on the other, causing a tension that might lead to breaking of the wings. It is best to provide a rail around the tank about the distance above required to hold the shortest drill, and to drive pins about 3 in. apart in this rail. By placing the drills between these pegs they can be kept in a vertical position. When using this tank a small flow sufficient to displace the water heated by the cooling of the bits should be turned on to keep the supply always cool.

Best Woods for Piling.—At the Oct. 1909, Convention of the American Railway Bridge and Building Association the following facts were brought out on the subject of wood for piling. Mr. W. T. Powell, Colorado & Southern Ry., Denver, Colo., reported that untreated long leaf yellow pine had a life of about six years and the use of this material was abandoned in favor of oak about two years ago. The oak procurable by his road is small and crooked so the use of treated short leaf yellow pine will be resorted to although the life of good oak piles is placed at approximately sixteen years. Mr. J. T. Parker, Santa Fe Coast Lines, San Bernardino, Calif., stated that his line use mainly Oregon pine for piles but in recent years this is inferior in quality to that received ten to fifteen years ago. White cedar has given the best service, lasting from eight to fifteen years, depending upon soil and other conditions. Second cuts do not last so long. Good Oregon pine has given nearly the same length of service under like conditions. Mr. L. D. Smith Southern Pacific Co., San Francisco, reported the use of Oregon pine and Washington fir treated with ten pounds of creosote per cubic foot at the company's plant. In Texas on the El Paso & Northeastern R. R., Mr. B. J. Mustin, said Texas pine creosoted is used in all pile bridgework. Mr. A. H. King, Oregon Short Line R. R. reports success with saltwater, the piles of Oregon fir being submerged a year or longer in the waters of the Great Salt Lake. As long as the saline coating remains on the timber the crust proves a very valuable preservative, and piles driven 25 to 30 years ago in the lake are in perfect condition, but as yet he is unable to say what the results may be with piles thus treated, and used in other places, remote from the lake.

A national convention of inventors is to be held at Rochester, N. Y., June 13 to 18, 1910, under the auspices of the International Congress of Inventors, an organization established four years ago to work for the reform of patent law and procedure and the better protection of inventors' rights. Arrangements for the convention are in the hands of Alexander B. Lamberton, president of the Board of Park Commissioners of Rochester.

The Louisville & Nashville R. R. has bought the 25-mile line belonging to the Cullman Coal & Coke Co., of Cullman, Ala., and will complete it and operate it.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Some Methods and Costs of Oiling Roads in St. Louis with a Description of a New Construction Employing Molded Slabs of Bitumen and Aggregate.

In St. Louis Mr. Jas. C. Travilla, Street Commissioner, ably assisted by Mr. W. L. Hempelman, chemist for the Department, has been doing much advanced work along experimental lines, in the use of oils and bitumens for the preservation of road surfaces. A careful study has been made of all current literature on the subject and of experiments being conducted elsewhere so that each experiment made in St. Louis is rather in advance of previous work instead of a duplication.

Fig. 1—Tank Wagon for Heating and Mixing Oil-Asphalt Compounds.

The following specifications for residuum oils for road treatment have been in use the past season. The use of No. 1 oil will be abandoned this season since this oil is too light, its use producing but temporary results at best. Specifications for No. 2 and No. 3 oil will be slightly modified for the coming season and a new grade introduced between them.

NO. 1 OIL.

The specific gravity of the oil shall be not less than 0.075 (30° Be) at 60° F. (15.5° C.). Evaporation loss upon heating a 20 gr. sample in a vessel 2¼ ins. in diameter and 1½ ins. high, with vertical sides, for six hours:

At 212° F. (100°.C.) not to exceed five per cent (5%).

At 325° F. (163° C.) not to exceed fifteen per cent (15%).

At 400° F. (205° C.) shall not exceed twenty-eight per cent (28%).

The oil shall be steam refined, and shall be free from insoluble or suspended matter. Information in writing concerning the source of the oil, with a ½ gal. sample of same, must be submitted with each bid.

NO. 2 OIL.

The specific gravity of the oil shall be not less than 0.931 (20.4° Be.) at 60° F. (15.5° C.). Evaporation loss upon heating a 20-gr. sample in a vessel 2¼ ins. in diameter and 1½ ins. high, with vertical sides, for five hours at 325° F. (163° C.) shall not exceed 4 per cent. The oil shall be steam refined and when evaporated at a temperature not to exceed 500° F. (260° C.) it must give a residue of not less than 60 per cent, having a penetration of 10 millimeters at 77° F. in 5 seconds, under a weight of 100 grs. using a No. 2 needle. The oil shall be free from insoluble or suspended matter. Information in writing concerning the source of the oil, with a ½ gal. sample of same must be submitted with each bid.

NO. 3 OIL.

The asphaltum oil shall have the following characteristics: It shall have a density of not less than 0.982 (12.6° Be.) at 15.5° C. (60° F.). It shall be free from water and the evaporation loss upon heating a 20-gram sample in a vessel 2¼ ins. in diameter and 1½ ins. high, with vertical sides for five hours at 400° F. (204.5° C.) shall not exceed 2½ per cent. It shall not yield more than 6 per cent fixed carbon on ignition. It shall be of such a consistency that it will pour at 95° F. It shall be steam refined and free from insoluble or suspended matter. It shall not flash below 400° F., closed oil-tester, when temperature is raised at rate of 20° F. per minute. It shall be delivered in barrels of about 400 lbs. capacity. Information in writing concerning the source of the oil, with a ½

For mixing and heating the oil-asphalt compounds the machine shown in Fig 1 has been used by Mr. Travilla.

Card Fig 2 is used where the oil, heated in the tank car, is pumped directly into the distribution wagon; card Fig 3 is used in connection with the oil-asphalt heater. These two cards are furnished in block form, while that represented by Fig 4 is a postal-card. Figure 5 is a 4x6 in. permanent laboratory record card, of good quality. Cards Figs. 2 and 3 make it possible to allow for the expansion of the oils, due to the high temperature to which they are heated before distribution on the road. It will be seen from card Fig. 4 that the cost per yard per day for all roads oiled can be easily determined.

Fig. 3.

The plant consists of a melting and agitation kettle, a storage compartment, air-pump for furnishing compressed air for agitating the oil-asphalt mixture and for forcing the same from the pressure or storage compartment to the distribution wagon, also a steam pump as an auxiliary for pumping heavy oil from the tank car to the melting kettle, and a steam boiler for the operation of the air-pressure and steam pumps.

The heater has a capacity of 1,350 gals. and is divided transversely into two equal parts. Both sections are provided with air-agitation pipes the open compartment being used for melting and thoroughly agitating the oil-asphalt mixture, the other closed compartment for receiving the mixture previous to forcing it into the distribution wagon.

The method of operation is as follows: The oil-asphalt compound, in the kettle or open compartment, is melted and is agitated by means of air pressure. When the desired temperature and consistency of the mixture has been obtained, it is drawn into the closed compartment and then by air-pressure is delivered to the distribution wagon. In the mean time another charge is being heated and mixed in the open compartment.

The cards shown by Figs 2 to 5 have been devised for keeping track of the oil used. In all places heretofore giving accounts of work done the records have not been very exact but by using cards, Fig 2 and Fig 3, for each load, all necessary information will be obtained. One feature worthy of notice is that the exact number of gallons used and the area covered per day is recorded.

Fig. 5.

Sunday in good weather from 1,500 to 2,000 automobiles pass over this section which is 1,840 ft. long and 25 ft. wide, a total of 5,110 sq. yrs. The Good Roads convention in November, 1910, it is expected will be much interested in this work. The following data were obtained on cost of labor and material, exclusive of preparation of base.

Section A: 975 sq. yds.; old park road broomed clean, oiled with No. 3 oil and covered with gravel and sand; 14c per sq. yd.

Section B: 400 sq. yds.; new macadam rolled, voids partly sand-filled, then No. 3 oil, sand and limestone dust; 28c per sq. yd.

Section C: 136 sq. yds.; new macadam, voids partly sand-filled, tar painted, sanded, coating A. C. and sand. The A. C. mixture—2 parts No. 3 oil and 1 part asphalt; 30c per sq. yd.

Section D: 400 sq. yds.; new macadam rolled, tar painted, slabs, flush coat, sand or torpedo gravel; 32c per sq. yd.

Section E: 533 sq. yds.; new macadam with limestone screening broomed in, No. 3 oil, light coat screenings, flush coat No. 3 oil, then ½ in. screenings rolled. Dust to take up excess of oil; 28c per sq. yd.

Section F: 140 sq. yds.; new macadam covered with asphaltic concrete 1 in. thick. Prepared at plant; 30c per sq. yd.

Section G: 420 sq. yds.; park road resurfaced, covered with No. 2 oil and coating of screenings and sand; 8c per sq. yd.

Section H: 550 sq. yds.; new macadam. Tarvia treatment.

Section I: Old park road oiled in 1908 and again treated with No. 2 oil in 1909, covered with sand; 5c per sq. yd.

These tests give valuable information. Particular interest attaches to Section D of malleable slabs because of the ingenuity displayed in overcoming the accidents of exposure, frost, moisture, excess of bitumen, etc., and dispensing with a portable plant for mixing the aggregate and cement.

Fig. 6—Isometric View of Special Road Construction, St. Louis, Mo.

In Forest Park last August, with the permission of Mr. Philip Scanlan, Park Commissioner, a stretch of experimental road was constructed and is now under test. On each Sunday in good weather from 1,500 to 2,000 automobiles pass over this section which is 1,840 ft. long and 25 ft. wide, a total of 5,110 sq. yrs. The Good Roads convention in November, 1910, it is expected will be much interested in this work. The following data were obtained on cost of labor and material, exclusive of preparation of base.

Figure 6 is an isometric view of the struc-

Fig. 7—View Showing Application of Bitumen to Broken Stone Foundation.

ture of the road and Figures 7, 8 and 9 are views showing different stages in the process of applying the wearing surface.

In applying a bituminous sand or gravel wearing surface possessing the necessary cementing properties, it has been considered essential to haul the "hot stuff" from the plant, to rake it to a uniform depth and to roll it while hot to obtain good results.

Mr. Travilla has used slabs made of a lightly compacted mixture, consisting of a selected sand or Torpedo gravel and bitumen, in such proportions that the slabs will maintain their shape while being handled and transported, but will be sufficiently plastic under ordinary atmospheric temperatures that it is unnecessary to heat them on the road.

The slabs are 12 in. square and 1 in. thick, containing about 10 per cent of bitumen. Before piling them up, the slabs are dusted with limestone dust, to keep them from sticking together.

The base for the roadway is rolled macadam, upon which was spread about 3 in. of clean stone, ranging in size from 1½ in. to 2½ in., lightly rolled into position. The surface of the stone, when perfectly dry, was painted with bituminous cement and the slabs laid thereon and given preliminary compression sufficient to force the bituminous mixture of the lower portion of the slabs into the interstices of the sub-structure. A flush coat of bituminous cement was then applied to more effectually waterproof the surface and to co-operate in the welding of the slabs, after which the surface was covered with grit and thoroughly rolled, until ultimate compression was obtained; thus providing a firm wearing surface of from ¼ in. to ¾ in. in thickness.

The coating of the macadam with bituminous cement, protects the slab surface from moisture from below; the impervious top with the proper crown to the roadway, insures proper surface drainage and a lasting roadway.

It is considered that this method does away with all the difficulties heretofore experienced in building roads with a bituminous wearing surface and is patented, Mr. Travilla believing that the supervision by men interested in the process, rather than in the job, will insure good work.

In commenting on road construction, Mr. Travilla claims that the life of a macadam pavement depends largely on the hardness of the stone in the 1 in. wearing surface and that by this method of road construction, a selected material may be used and since the slabs are of uniform size and thickness, the application thereof, is rapid and without the need of any particular skill. The slabs also form a mechanical interlock with the macadam, which prevents the creeping of the surface layer and binds the stone together. The bituminous mixture which originally consisted of a multiplicity of slabs, becomes ultimately a continuous, hard and smooth layer of substantially uniform thickness and makes a comparatively inexpensive pavement, which is resilient, durable, water-proof and dustless.

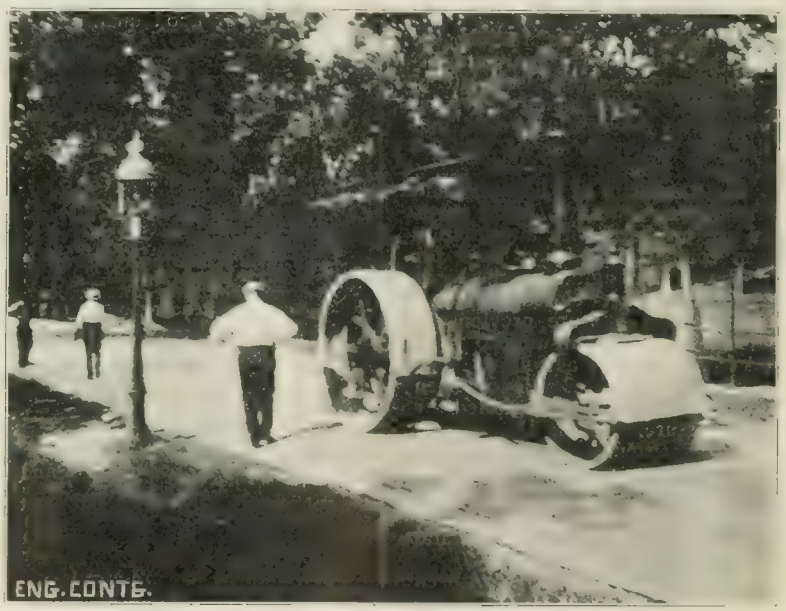

Fig. 9—View Showing Bituminous Slabs Being Rolled into Continuous Sheets.

Fig. 8—View Showing Placing of Bituminous Slabs on Foundaton Stone.

The United States Civil Service Commission announces an examination on April 20, 1910, to secure eligibles from which to make certification to fill a vacancy in the position of engineer in wood preservation. District No. 2, Forest Service, at $1,300 per annum, and vacancies requiring similar qualifications as they may occur.

Suggested Standard Practice for Pavement Bonds and Guarantees and Suggested Specifications for Asphalt and Bituminous Pavements.

In addition to the subjects mentioned in our issues of March 9 and 16, the Organization of City Officials for Standardizing Paving Specifications at its first convention at Chicago, Febraury 21 to 26, also considered the questions of securing a uniform practice in regard to pavement bonds and guarantees and the securing of standard specifications for asphalt and bituminous pavement.

The committee on uniform practice on pavement bonds and guarantee consisted of the following: W. J. Hardee, Chairman, City Engineer, New Orleans, La.; Henry C. Allen, City Engineer, Syracuse, N. Y.; George H. Norton, Deputy Engineer Commissioner, Department Public Works, Buffalo, N. Y.; Chas. A. V. Standish, Secretary Board of Local Improvements, Chicago; A. C. Kugel, Chairman

Paving Committee, Omaha, Neb.; Chas. E. Norton, Member Board Public Works, Grand Rapids, Mich., and Robt. W. Goodnow, Secretary Board of Public Works, Kansas City, Mo. This committee found that the practice of providing for the maintenance of pavements upon completion and requiring a guarantee to insure the faithful execution of the obligation is common to all cities The committee further found that the period of such maintenance and the methods of guarantee are widely different. Ten years of maintenance are still insisted upon in some cities for all classes of pavements, five years for soft pavements and three years and one year for the hard pavements are required in others, and in one city, Baltimore, City Engineer B. T. Fendall has recommended to his City Council, without the prospects of adoption, that maintenance periods be eliminated altogether from their contracts, because he believes that unnecessary amounts are being paid out for maintenance and that it is practicable to establish and operate a system of inspection that will afford every reasonable and necessary assurance that the contract in all respects, both as to materials and labor, has been properly executed.

The usual practice to insure the faithful performance of the contract to maintain the pavement for a given period is to resort to a guarantee bond. In the majority of cases this bond is required to be that of a bonding company, although since the bonding companies have declined to write ten-year risks, those cities asking for ten-year guarantees have been obliged to accept personal bonds for five years of the period.

Until recently this practice was general, but experiences related by several of the cities have led to the adoption in some cases of a further safeguard to insure the maintenance of the pavements. This further safe-guard is the requirement that at the close of the construction work there shall be left with the city a cash deposit or its equivalent, which may be used for the purpose of making repairs, in case the contractor fails from any cause to meet his obligation during the life of his contract. The money is to be returned during or at the expiration of the period, provided the contract has been fulfilled.

In some cases, in fact in the majority of cases brought to the committee's attention, both the cash reserve and the guarantee bond are required to be given, with the object of doubly insuring the proper maintenance. In New Orleans alone for the past year and a half the use of maintenance bonds has been abandoned because in every case of default it was not possible to recover on the bond, and instead a cash reservation, equal to 15 cts. per square yard in the residential districts and 25 cts. per square yard in the business districts, has been made to guarantee the maintenance. Taking into consideration all the facts brought to its attention, the committee concluded to make the following recommendations: (Suggested Standard Practice for Pavement Bonds and Guarantees.)

(1). That all pavements, any portion of which is constructed of materials of a perishable nature, among which we would include asphalt, bitulithic or bituminous macadam and wood block, or other pavement requiring special equipment to lay and maintain, and also such pavements as are of a patent or proprietary nature, new or more or less experimental in character, shall be required to be maintained for a period of five years from the first day of July next following completion.

(2). That all pavements composed of materials more durable in character, among which we would include stone block, vitrified brick, and well-established Portland cement concrete pavements, shall be required to be maintained for a period of one year from the first day of July next following the completion.

(3). That in the case of all pavements, a cash deposit, or its equivalent, of 10 per cent of the contract price per square yard for each square yard of pavement be retained for the whole of the maintenance period, said sum with its accumulations, if any, to be paid in full to the contractor if he fulfills the terms of his guarantee. The reservation is to be subject, however, during the maintenance period, for use by the city in making such repairs as are necessary and have been neglected or ignored by the contractor. In the latter case the balance of the fund, if any, shall be returned to the contractor at the end of the maintenance period.

(4). We further recommend that if the bonding companies will offer a uniform and standard form of guarantee, satisfactory in form and cost to the cities, members of this Association, which will protect the cities as amply and accomplish the purpose of keeping the pavements in repair as fully as may be done by the cash reserve plan, a guarantee bond in twice the amount of the established cash reserve be accepted in lieu thereof.

(5). In case of the satisfactory adjustment in the guarantee bond plan, and its adoption by this Association, it is further recommended that any default on the part of any bonding company in any of the cities of this Association shall be reported to its Secretary, and it shall be his duty to report to each of the said cities on account of such default.

Our conclusions with respect to the period of maintenance for pavements like asphalt are based on the theory of the execution of the construction under specifications permitting the contractor to use his own judgment between certain limits in manufacturing the pavement, thus assuming to himself the responsibility and risk of its success, and relieving the city therefrom.

If it is the determination of the Convention to adopt close drawn specifications for asphalt and similar pavements, taking over to the city the full responsibility for the manufacture and construction of the pavement, our views upon this subject will have to be modified.

ASPHALT AND BITUMINOUS PAVEMENTS.

The committee on standard specifications for asphalt and bituminous pavements consisted of Geo. W. Craig, Chairman, City Engineer, Omaha, Neb.; Linn White, Chief Engineer, South Park Board, Chicago, Ill.; Geo. W. Tonson, Chief Engineer Department Public Works, Toledo, O.; W. R. Benson, Chief Bureau of Highways, Philadelphia, Pa.; J. M. Burrows, Assistant City Engineer, Des Moines, Ia.; E. P. Babcock, First Assistant Engineer, Buffalo, N. Y.; L. W. Rundlett, Commissioner of Public Works, St. Paul, Minn.; L. Kirachbraun, Asphalt Chemist, Chicago; Geo. F. McGonagle, City Engineer, Salt Lake City, Utah, and L. W. Anderson, City Engineer, Grand Rapids, Mich. In its report the committee stated "in preparation of specifications such as these, where there is such a rapid progress being made in the use of asphalt and kindred pavements, it is impossible to make a general specification that will answer all of the requirements for a length of time. A specification that might be made today, could be revised tomorrow, due to the rapid progress that is being made along these lines should be so considered. In preparation of the specifications we had this one thought in mind, realizing in any way discourage the use of the materials that we term as experimental, for what might be an experimental pavement today might be considered in the other class a year hence and that this committee or any other committee that may be selected by your honorable body for the preparation of specifications would be glad to admit of them. They are therefore of necessity more or less tentative and some materials are excluded until such times as further developments in the sciences and technology of their manipulations make their use safe. They are open enough to admit of the use of such range of materials as have proven to be beyond the experimental stage, yet they are sufficiently conservative to insure with skilled supervision and expert direction the laying of a durable pavement. Reiterating again, we are cognizant of the rapid development of the paving industry and we anticipate that in the near future that it may be advisable to extend the range of these specifications.

"In the preparation of the specifications for Bituminous Concrete the committee do not assume to pass on the validity of the patents that may have been issued for certain paving mixtures and methods, and the various municipalities that may adopt these specifications are advised by the committee to determine their own policies as to the recognition of these patents."

SPECIFICATIONS FOR SHEET ASPHALT PAVEMENT.

Sub-drainage—When the soil is of such a character that it retains an excessive amount of moisture, such as clays subject to swelling or heaving under the action of frost, or sands similar to quick sand that do not afford a ready natural drainage, subdrains should be provided.

Subdrains may be of two general kinds, first, tile drains of open porous material or vitrified tile laid with open joints, second, trenches filled with broken stone, gravel, cinders or other similar material.

In some cases it may be sufficient to construct a line of tile or a trench filled with broken stone, cinders or gravel, on each side of the roadway at or near the lines of the gutters, but when the soil is of a very wet nature, it may be advisable to lay additional lines of drains which may be in or near the middle of the roadway. This system of drains may be varied by diagonal lines of drains running from near the crown of the roadway to the gutters.

In all cases the drains should have connections with the existing sewers, catch basins or inlets.

Foundations of an Asphalt Pavement—The contractor will be required to do all of the grading necessary to bring the surface to the proper sub-grade as determined by the lines and grades given by the engineer. If the material at sub-grade shall be of an unstable character and unfit for foundation the contractors will make such additional excavation as may be determined by the engineer and refill with suitable material approved by the engineer. Should the sub-grade require draining, such provision shall be made as the local conditions will require, as determined by the engineer and provided for in the specifications for that particular locality. After all necessary grading has been done to bring the surface to sub-grade, the street shall be thoroughly rolled with a steam roller weighing not less than ten tons. If settlement occur the depression shall be filled and then rolled until the surface is solid and uniform. All filling shall be free from animal or vegetable matter and of a character approved by the engineer. Should the foundation be of sand, which would be impracticable to roll, the entire roadway from curb to curb shall be thoroughly puddled by flooding with water one or more times if found to be necessary. The contractor shall furnish all water and hose for puddling and all necessary labor to properly perform the work.

Asphalt Surfacing Mixture; Refined Asphalt—The refined asphalts to be used for paving mixtures herein required shall be derived in the following manner:

(1). By heating, if requiring refinement, crude, natural solid asphalt, to a temperature of not over 400° F. until all the water has been driven off. Crude, natural, solid asphalt shall be construed to mean any natural mineral bitumen either pure or mixed with foreign matter, from which, through natural causes in the process of time the light oils have been driven off until it has a consistency harder than 100 penetration at 77° F. At least 98½ per cent. of the contained bitumen in the refined asphalt which is soluble in cold carbon disulphide, shall be soluble in cold carbon tetra chloride. Such asphalt must melt readily upon the application of heat. In no case shall it be prepared at the refinery with any product not hereinafter provided for.

(2). By the careful distillation of asphaltic petroleum until the resulting residue has a consistency not harder than 40 penetration at 77° F.

(a). The solid residue so obtained shall be soluble in carbon tetra chloride to the extent of 98½ per cent.

(b). Its bitumen shall yield upon ignition not more than 15 per cent. of fixed carbon.

(c). When 20 grams of the material are

heated for five hours at a temperature of 325° F. in a tin box 2½ ins. in diameter, after the manner officially prescribed, it shall not lose over 5 per cent. by weight nor shall the penetration at 77° F. after such heating be less than one-half of the original penetration.

(d). A briquette of the solid residue having a cross section of one square centimeter shall have a ductility of not less than 30 centimeters at 77° F.

NOTE:—Combinations of asphaltic and semi-asphaltic residues having the ductility and other characteristics above named are admitted under Section 2.

(3). By combining at the paving plant in uniform and fixed proportions which shall be satisfactory to (proper city official) solid, natural asphalt and solid asphaltic residue as hereinbefore described. The refined natural asphalt shall be derived from the crude natural asphalt of the quality and in the manner specified before, except that the crude natural asphalt may have added to it, if desired, at the refinery, as a partial fluxing, an amount of asphaltic or semi-asphaltic flux of the character and within the limit specified elsewhere herein, such fluxing to be conducted under the supervision of (proper city official) when desired. In the use of these mixtures of refined asphalts or asphaltic cements, only asphaltic or semi-asphaltic fluxes shall be used, except in those cases where the solid natural asphalt is of such character that when mixed with parafine flux without the further addition of any other material, it will produce an asphaltic cement complying with the requirements hereinafter set forth under that head. In such cases any of the fluxes elsewhere herein specified may be used.

The preparation and refining of all asphalts admitted under these specifications shall be subject to such inspection at the paving plants and refineries as the (proper city official) may direct.

Flux—The fluxing material may be a parafine, a semi-asphaltic, or an asphaltic residue which shall be tested with and found suitable to the asphalt to be used. It shall be free from water or other impurities.

The residuums must have a penetration greater than 350 hundredths centimeters, with a number 2 needle at 77° F. under 50 grams weight for one second.

A natural Maltha may be used if it passes the heat and flash tests specified under "a" and all fluxes must furthermore remain soft after heating for five hours at 400° F.

All residuums shall be soluble in cold carbon tetra chloride to the extent of 99 per cent.

(a). The parafine residuum shall have a specific gravity of .92 to .94 at 77° F. It shall not flash below 350° F. when tested in the New York State closed oil tester, and shall not volatilize more than 5 per cent. of material when heated five hours at 325° F. in a tin box 2½ ins. in diameter as officially prescribed. The residue after heating shall flow at 77° F. and shall be homogeneous and shall show no coarse crystals.

(b). Semi-asphaltic residuum shall have the same general characteristics as parafine residuum except that it shall have a specific gravity of .94 to .98 at 77° F.

(c). Asphaltic residuum shall have the same general characteristics as parafine residuum except that the specific gravity shall be not less than .98 nor more than 1.04 at 77° F. The asphaltic residuum after evaporation at 500° F. to a solid of 50 penetration shall have a ductility of not less than 30 cm.

Asphaltic Cement—The asphaltic cement prepared from materials above designated shall be made up from the refined asphalt or asphalts, and the flux where flux must be used, in such proportions as to produce an asphaltic cement of a suitable degree of penetration. The proportion of the refined asphalts comprising the cement shall in no case be less than 40 per cent by weight.

When weight of flux in the asphaltic cement prepared from solid natural asphalts exceeds 25 per cent thereof, asphaltic or semi-asphaltic flux shall be used. Semi-asphaltic flux in such case, must have a gravity of not less than .95 at 77° F.

Refined asphalts and flux comprising the asphaltic cement shall, when required, be weighed separately in the presence of the authorized inspectors or agents of (proper city official).

Refined asphalt and flux used in preparing the cement shall be heated together in a kettle at tempertures ranging from 250° to not over 375° F., and be thoroughly agitated when hot by air, steam or mechanical appliances, until the resulting cement has become thoroughly mixed into a homogeneous mass. The agitation must be continued during the entire period of preparing the mixtures. Cement shall always be of uniform consistency, and if any portion should settle in the kettles between intervals of using the same, it must be thoroughly agitated before being drawn for use.

The asphaltic cement shall have a penetration of from 30 to 100 which shall be varied within these limits to adapt it to the particular asphalt used in the paving mixture and to the traffic and other conditions of the street.

(a). When 20 grams of the asphaltic cement of the penetration to be used in the paving mixture shall be heated for five hours at a temperature of 325° F., in an oven as officially specified, there must not be volatilized more than 5 per cent. of the bitumen present, nor shall the penetration at 77° F. after such heating be less than one-half of the original penetration.

(b). The bitumen of the asphaltic cement shall give upon ignition, not more than 15 per cent. of fixed carbon.

(c). A briquette of the pure bitumen of the asphaltic cement of the penetration to be used in the paving mixture, having a cross section of one square centimeter, shall elongate to the extent of not less than ten centimeters nor more than one hundred centimeters at 77° F.

Sand—The sand shall be hard-grained and moderately sharp. It shall be free from loam or any other foreign material, and shall be so graded as to produce, in the finished surface mixture, the mesh requirements elsewhere herein specified. It shall contain not to exceed 6 per cent of sand that will pass a No. 200-mesh sieve.

Binder Stone—Stone or gravel to be used for asphaltic concrete binder shall be hard and durable, free from all foreign substances, and of varying sizes, from one inch down.

Preparation of Asphaltic Concrete Binder—Asphaltic concrete binder shall be made as follows:

The binder stone and sand as above specified shall be heated to from 200° to 325° F. in suitable appliances. Stone and sand shall be measured off separately and then be mixed with sufficient asphaltic cement prepared as heretofore specified, in such proportions that the resulting aggregate will contain by weight material passing a No. 10 mesh screen, between 30 and 40 per cent, and bitumen in quantity from 5 to 8 per cent. of the entire mixture. Concrete thus prepared shall be a compact mass containing a minimum of voids. If the permission of (proper city official) were available, old asphaltic surface paving mixtures may be used in combination with the binder stone, such mixtures having been previously crushed or disintegrated and augmented with at least 1 per cent. of fresh asphaltic cement, so that when combined the resulting concrete shall form an equally compact mass and correspond as to aggregate passing a No. 10 mesh screen and it contained percentages of bitumen with the requirements for the mixture previously specified.

NOTE: Inasmuch as the percentage of bitumen in the binder will depend upon the grading of the aggregate, the proportions of the materials used in the above may be varied by (authorized city official), but only within the limits designated.

Laying Asphaltic Concrete Binder—The asphaltic concrete binder shall be brought to the work in wagons, covered with canvas or other suitable material, and upon reaching the street shall have a temperature of 200° to 325° F. It shall be placed upon the street and raked to a uniform surface to such depth that, after being rolled and thoroughly compacted, it shall have a thickness of ... ins. The surface, after compression, shall show at no place an excess of asphaltic cement, and any spot covering an area of 1 sq. ft. or more showing an excess of asphaltic cement, shall be cut out and replaced with other material. Smaller spots may be dried by the use of stone dust and smoothers. Any asphaltic concrete binder broken up during the process of laying must be removed and replaced with new material. Asphaltic concrete binder shall be followed and covered with wearing surface as soon as is practicable in order to effect the most thorough bond between the binder and the wearing course.

Asphaltic Surface Mixture or Wearing Course—The committee in presenting two kinds of mixtures for wearing surface, one having as filler Portland cement and one with a stone dust filler, considers that the adopton or application of either would be a matter of local conditions and accordingly should be left to the discretion of the engineer in charge of such paving construction.

The surface mixture shall consist of asphaltic cement, Portland cement, (stone dust) and sand proportioned by weight so that the resulting mixture will contain average proportions of the whole mixture as follows:

	Mixture A. Per Cent.
Bitumen soluble in cold carbon disulphide	11.0 to 13.5
Portland cement passing a No. 200 sieve	10.0 to 15.0
Sand passing a No. 80 sieve	18.0 to 36.0
Sand passing a No. 40 sieve	20.0 to 50.0
Sand passing a No. 10 sieve	8.0 to 20.0
Sand passing a No. 4 sieve	up to 10.0

	Mixture B. Per Cent.
Bitumen soluble in cold carbon disulphide	10.5 to 13.5
Stone dust passing a No. 200 sieve	10.0 to 15.0
Sand passing a No. 80 sieve	18.0 to 36.0
Sand passing a No. 40 sieve	20.0 to 50.0
Sand passing a No. 10 sieve	8.0 to 20.0
Sand passing a No. 4 sieve	up to 10.0

The item designated as "Portland cement (stone dust) passing a No. 200 sieve" within the limits named herein, includes in addition to the Portland cement (stone dust) fine sand passing a No. 200 sieve not exceeeding 4½ per cent of the total mixture, and such 200-mesh mineral dust naturally self-contained in the refined asphalt.

Sand and asphaltic cement shall be heated separately to about 300° F. The maximum temperature of the sand at the mixers shall in no case be in excess of 375° F. and the maximum temperature of the asphaltic cement shall not exceed 325° F. at the discharge pipe. The Portland cement (stone dust) shall be mixed with the hot sand in the required proportions, and then these shall be mixed for at least one minute with the asphaltic cement at the required temperature, and in the proper proportions in a suitable apparatus so as to effect a thoroughly homogeneous mixture.

The proportion of asphaltic cement shall at all times be determined by actual weighing with scales attached to the asphaltic cement bucket.

The Portland cement (stone dust) and sand must also be weighed unless a method of gauging approved by the (authorized city official) shall be used.

The contractor shall furnish every facility for the verification of all scales or measures.

The sand gradings and bitumen may be varied within the limits designated in the discretion of (proper city official).

Laying the Wearing Surface—The asphalt wearing surface shall be hauled to the work in wagons provided with a canvas or other suitable cover. It shall leave the plant at a temperature between 250° and 325° F. as suitable for the asphalt used. Upon arrival at the street it shall be dumped at such distance from the work that all of the mixture must be turned and distributed to the place where it is to be raked. It shall be spread, while hot, to such depth upon the Asphaltic Concrete Binder, which must be thoroughly dry, free from leaves or other foreign matter, that after receiving its ultimate compression by rolling, it shall have a thickness of ... ins. The initial compression may be effected by means of a small roller, after which a small amount of mineral dust shall be swept over the surface. The final compression shall be

effected by a 10-ton roller, or the equivalent of not less than 250 lbs. per running inch width. Rolling must be steadily kept up and continued until all roller marks shall disappear and the surface shall give indication of no further compressibility.

NOTE: All tests herein provided must be conducted according to official methods on file in the office of (proper official).

All penetrations indicated herein, unless otherwise specified refer to the depth of penetration in hundredths centimeters of a No. 2 needle weighted with 100 grams at 77° F. acting for five seconds.

SPECIFICATIONS FOR BITUMINOUS CONCRETE PAVEMENT.

Foundation—The foundation upon which the pavement is laid may be either concrete or macadam. If of concrete it may be laid according to the standard specifications for concrete foundation, the surface being made rough and grainy so the paving material may get a proper bond or grip on the concrete. If the pavement is to be laid on a new macadam foundation the macadam shall be built according to the standard specifications except the upper ½ in. shall not be completely filled and bonded, the intention being the same as with the concrete foundation, viz.: to produce a somewhat rough, grainy surface into which some of the paving mixture will be forced by the roller. For heavy traffic 8 ins. of well-compacted macadam may be considered equal to 6 ins. of concrete, and for light or ordinary traffic 6 ins. of macadam equal to 4 or 5 ins. of concrete. If the pavement is to be laid on an old macadam base, the surface shall be thoroughly swept and cleaned of all fine material that may be either caked upon the surface of the stone or lying loose as dust, thereby exposing the clean stone in the surface for the reception of the paving material. If the old macadam is not in suitable condition or proper grade after cleaning it shall be spiked up and redressed to the proper crown and grade, the coarse stone being left at the top, or new stone added when, in the opinion of the engineer, it is needed to give the desired grainy surface or thickness of foundation. It shall then be thoroughly rolled with the use of as little water as possible so the macadam does not finish smooth.

When it is not practicable to secure a foundation, either macadam or concrete, with sufficient grain in the surface to give the desired bond or key between the foundation and the paving material, the adhesion between the two may be increased by sprinkling the foundation with the bituminous cement before the paving mixture is spread, using not exceeeding ¼ gal. per square yard.

An old brick or granite block pavement, if in the opinion of the engineer it is well supported and stable, may be used as a base for the bituminous concrete pavement by thorougly cleaning the old pavement and sprinkling its surface with the bituminous cement.

Wearing Surface—On the foundation as heretofore specified shall be laid the bituminous concrete wearing surface, which shall be composed of carefully selected, sound, hard, crushed stone and sand mixed with bituminous cement and laid as hereinafter specified. This wearing surface shall have a thickness of ... inches after thorough compression with a 5-ton tandem roller.

Mineral Aggregate—The mineral aggregate shall consist of broken stone or broken stone and sand of a fairly uniform grading from the largest to the smallest particles in such proportions as to give the mixture a maximum degree of density and low percentage of voids. The maximum size of stone used may range from that passing a screen having circular openings ¾ in. in diameter up to 1¼ in. in diameter. Crusher run of stone between 1 in. and screenings passing a ¼-in. mesh screen may be used if found to be fairly evenly graded. Coarser stone when used shall be graded and remixed in proper proportion. (The screenings passing the ¼-in. mesh screen may be used when the bitumen is refined coal tar or an asphalt not having a less ductility.) Coarse and fine sand having proper grading shall be added in such proportions as necessary to secure the dense aggregate specified above. Stone dust or hydraulic cement may be added as needed when the character of the bitumen used requires it.

Bituminous Cement—The bituminous cement may be either refined coal tar or asphaltic cement.

Coal Tar—The coal tar must be the residue of the distillation of coal tar only and be specially refined for the purpose. No admixture of hard pitch with the lighter oils of coal tar will be permitted. The cement shall conform to such physical and chemical tests necessary to satisfy the (local officials) as to its suitability.

(The committee does not find available sufficient data enabling the preparation of more detailed specifications at this time. We recommend careful experiments and collection of data for future consideration.)

Asphaltic Cement—The asphaltic cement may be prepared: (1) from refined natural asphalt; (2) from the residue obtained in the oxidation or distillation of asphaltic or semi-asphaltic petroleum; (3) from any uniform combination of the preceding materials together with a suitable flux, if flux be necessary, such combination being subject to the approval of the engineer.

Each bidder must state the nature and origin of the bitumen to be used by him, and further, shall submit samples of the bitumen with his proposal.

The asphaltic cement shall pass the requirements designated below:

(1). The asphaltic cement shall have a penetration of 30 to 100 hundredths centimeter at 77° F. Dow Standard, which shall be suitable to the nature of the material used and to the traffic and other conditions of the street.

(2). When 20 grams of the cement are maintained at a temperature of 325° F. for five hours in a tin box 2½ in. in diameter, there must not be volatilization more than 3 per cent by weight of the bitumen present, nor shall the original penetration be reduced thereby over one-half.

(3). The bitumen of the asphaltic cement shall give upon ignition not more than 15 per cent of fixed carbon.

(4). Ninety-eight and one-half per cent of the bitumen of the asphaltic cement which is soluble in carbon disulphide, shall be soluble in carbon tetra chloride.

(5). At 32° F. the bitumen of the cement shall have a penetration of not less than 10 when tested one minute with the needle weighted to 200 grams, and at 115° F. when weighted to 50 grams for five seconds, shall have a penetration of not more than 280.

(6). The cement shall not flash at a less temperature than 350° F., New York state closed oil tester.

Method of Mixing—The aggregate shall be thoroughly dried in properly designed driers before mixing with the bitumen. The driers shall be of the revolving type, thoroughly agitating and turning the materials during the process of drying. When the aggregate is thoroughly dried and heated to a temperature of from 200 to 350° F. depending on the bituminous cement used it shall be immediately, before cooling or exposing to moisture, mixed with the hot bituminous cement as hereinafter specified.

The bituminous cement shall be melted in a tank arranged so the heat can be properly and easily controlled and regulated. When melted and raised to a temperature of from 200 to 350° F. depending upon the bituminous cement used, it shall be combined in proper proportions with the hot aggregate and immediately mixed in a properly designed mixer with revolving blades until a thorough and intimate mixture of the ingredients has been accomplished, and the particles composing the aggregate evenly and thoroughly coated with the bituminous cement. The mixer shall not be exposed directly to the action of the fire.

Laying—While still hot from the mixer, the paving mixture shall be spread evenly on the foundation with hot iron takes or shovels or both, so that when compressed with the roller it shall have the thickness specified above, with the surface even and true to grade. Along the curb and around manholes, catch basins and other obstructions in the street where the roller cannot reach, the compression shall be secured by the use of hot iron tampers. The tamping shall be done as quickly as possible after the material is spread, while still hot and pliable. When the paving mixture is hauled on the street in dump wagons it shall be kept covered with canvas to retain heat, dumped on platforms and shoveled into place and raked to secure the proper grade. As soon as the temperature will permit, the paving mixture shall be rolled with a tandem steam roller weighing at least five tons and the rolling continued, working lengthwise and diagonally of the street. Rolling must be steadily kept up and continued until all roller marks shall disappear, and the surface gives indications of no further compressibility.

The paving shall be done continuously, so the number of joints between the hot and cold material shall be reduced to the minimum. When it is not practicable to lay it continuously and a joint is unavoidable the edge of the cold material shall be trimmed down to a rough feather edge, and the surface, where the joint is to be made, painted over with bituminous cement, the hot material raked over the feathered edge and thoroughly rolled. Instead of trimming the cold material joint strips may be used consisting of strips of canvas about 18 ins. wide with three parallel lines of ¾ in. ropes sewed on the under side about 3 ins. apart. The joint strips shall be laid on the feather edge of the freshly raked material with the upper rope at the line where the thickness begins to decrease and the rolling completed on top of the canvas as for finished pavement. The faces of the curb and gutter, iron castings, etc., shall be painted with the bituminous cement before the paving mixture is laid.

Surface Finish—As soon as possible after the rolling of the mixture is finished, and while the surface is still fresh and clean, and if possible while warm, a skin coat of bituminous cement of proper consistency to be flexible when cold shall be spread over the surface. It shall be spread on while at a temperature of from 200 to 350° depending on the bituminous cement used, and evenly spread with rubber squeegees. Only a sufficient coat shall be spread to flush the surface voids without leaving an excess. Immediately over this a top dressing of torpedo sand, fine gravel or stone, chips free from dust, which must be thoroughly dry and heated in cold weather, shall be spread and thoroughly rolled into the surface. A small surplus shall be left to be worn in or worn away by the traffic.

After the sand or stone chips have worn in to the surface the street shall be swept, all excess of surfacing material removed and the street left clean.

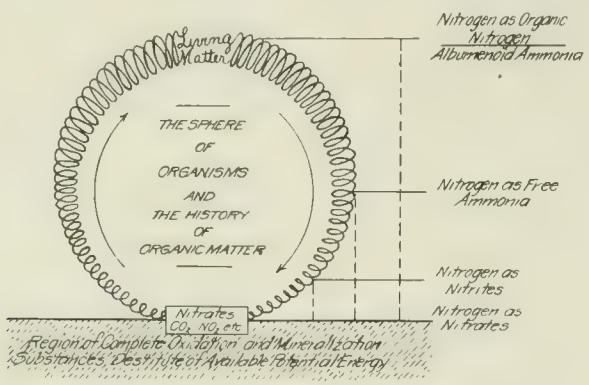
Water Power Plant.—The Keokuk & Hamilton Power Co., of Quincy, Ill., has perfected a plan for water improvements of considerable magnitude. The company intends to develop the power of the Des Moines rapids of the Mississippi river at Keokuk, Ia., and Hamilton, Ill. It will construct a dam across the river at the foot of the rapids, and a powerhouse immediately below the dam and parallel with the stream on the Keokuk side. The dam, including abutments, will be 4,700 ft. long. On top of the spillway will be placed 116-ft. flood gates, supported by concrete piers. These piers will be built integral with the dam, being carried down to bedrock. The piers will support an arched bridge, from which the gates will be operated by electric hoists. The dam will be constructed entirely of concrete and locked firmly into the rockbed of the river. The powerhouse will be 1,400 ft. long and 123 ft. wide. The substructure will be concrete, in which will be molded the water passages and waterwheel chambers. On top of this will be built the superstructure—a house of concrete, brick and steel 133 ft. high. The machinery will be capable of developing 250,000 H. P.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

The Sanitary Examination of Water.*

That pure water is one of the factors making for good health, few deny; but in a strict sense the mention of pure water is speaking of something that rarely exists, for even the distilled water of our laboratories is not pure in the chemist's sense; that is, it does not consist entirely of the elements, hydrogen and oxygen, chemically combined. Water is so readily a solvent of all kinds of matter, gaseous as well as solid, that unless extreme caution is taken, it is never chemically pure. When so prepared, as it may be occasionally, for experimental purposes it is to the scientist worth any price.



Nitrogen as Organic Nitrogen Albuminoid Ammonia
Gamma Matter
THE SPHERE OF ORGANISMS AND THE HISTORY OF ORGANIC MATTER
Nitrogen as Free Ammonia
Nitrogen as Nitrites
Nitrogen as Nitrates
Nitrates CO2 NO3 etc
Region of Complete Oxidation and Mineralization Substances Destitute of Available Potential Energy

Fig. 1—Diagram Illustrating the Sphere of Organisms and the History of Organic Matter.

But what we intend to say, and what we desire is not a pure water but a safe water,—one not likely to injure health. Such water we can find quite readily; and it is with this object in view, to prove the safety and guard against its pollution, that examination of water is made. The examination of water is made generally for two purposes: to determine its fitness as a potable water, i. e., for use for household or domestic needs; and its use for industrial purposes.

The Examination of Water.—The examination of water for the first class is called the sanitary water analysis; and of the second class, industrial water analysis.

The examination of these two classes is not distinct. The sanitary analysis includes the total amount of mineral matter held in solution, and the amount of that matter which causes "hardness," i. e., the precipitation of soap preventing formation of a lather. Industrial analysis includes this, but it determines also the particular substances which cause scale or corrosion.

The specific mineral contents are often determined in so called mineral waters, but rarely with the exception of "hardness," in sanitary analysis.

The sanitary examination of water includes the physical, chemical, and microscopical analysis, and the bacteriological examination. The object, as stated before, is to find out the quality of the water. Is the water at present receiving pollution of any kind? To what extent? Has the water at any time somewhat remote received pollution; if so, what is the origin of this pollution, animal or vegetable? Is the water hard or soft? Are there any vegetable organisms which by growth and decay are likely to cause nuisances due to odors? All these questions and others, the chemist has to answer from his sanitary examination.

In our laboratory work we shall devote the time to physical and chemical examination, and shall only learn of the methods of the microscopic and bacteriological.

Sources of Water.—The sources of our water are the dew, rain and snow which fall upon the earth's surface. The process by which this takes place is exactly similar to that of distillation and condensation, as conducted in the laboratory. The evaporation takes place from the ocean and larger lakes aided by the sun's rays and the winds. This moisture carried into the atmosphere remains until, by a change of temperature, condensation occurs and the moisture is precipitated, as rain or snow, depending upon the temperature. This precipitation is at first practically distilled water, but even in its passage through the atmosphere it absorbs gases, as carbon dioxide, ammonia, oxygen, and in the neighborhood of towns and cities sulphur dioxide, soot, and dust particles, both mineral and organic. It is quite high in ammonia.

Rain water is a "soft" water, and contains little mineral matter in solution; but when it reaches the earth it begins at once to dissolve the mineral salts, carbon dioxide, and "albuminoid" ammonia, of which latter we shall have much to say. The water thus enriched is capable of greater solvent action on rocks and soils. The water collects and may form rivulets and brooks, enlarging later into ponds and rivers, or it may sink deeper into the ground and then emerge as springs or become our wells. The rivers and ponds,—so-called surface waters, pass through the fields and forests where they take up considerable vegetable matter, such as leaves and peaty material. The color of the water is changed by this; and from the colorless water of the rain (that away from towns, at least) as viewed by looking through a considerable layer upon a white surface, as in Nessler tubes, it changes to a yellow or a brown color. This depends upon the amount dissolved, the color deepening with increasing amounts, similar to the steeping of tea. This vegetable coloring is organic matter. It is a highly complex molecule containing the elements carbon, nitrogen, oxygen, hydrogen, and is called by the name of "albuminoid ammonia." The estimation of the amount of albuminoid ammonia is important, but we must take into consideration its origin. If this be leaf or peaty matter, it is harmless, but if it be household and city wastes, which we may designate by the term sewage, it is objectionable and likely to be highly injurious. Our analysis of albuminoid ammonia does not point out its source.

The water which sinks into the earth will take up a large amount of mineral matter, but there is much less organic matter, peat or leaves. This water should be practically colorless. In distinction from the water which flows over the surface of the earth, surface waters, we designate wells and springs, as ground waters.

Water Pollution.—Up to the present we have assumed that the rain fall which we have followed in its collecting together, either as a surface or ground water, has not come in contact with the "wastes of human life." Such a condition could not long be maintained except in the virgin forests far away from habitation of man. Far up on the hillside it may be, a lonely farm house has diverted a little stream for drinking purposes. It flows through a sunken trough, where it may be dipped up both for family and barnyard use. A little way below this trough the flow from the kitchen sink finds its way into the brook. This it may do by directly flowing along the surface or sinking into the ground, emerging again into the brook, with less turbidity and other changes not so apparent to the eye. Again, the family cesspool, the barnyard with its manure heap, and the fertilized fields all have drainage outlets into the brook. This process of adding to the brook the "wastes of civilization" is repeated over and over again as the brook, increasing in size to the river, continues on its way. What the changes are which take place under the circumstances described, we will relate further on, but what we must remember is that along with the "household wastes" there may be disease germs, as typhoid. Of course, there are chances of purification. Seeds of tiny plants sprout and grow in the water, feeding upon the products of organic decay which have entered the water.

A part of the water sinks into the sand, and by this filtration becomes freed from suspended matter and disease germs. By running over rocks and minute waterfalls oxidation by the oxygen of the air takes place. Another purifying process is its storage by which suspended matter settles, and oxidation slowly goes on.

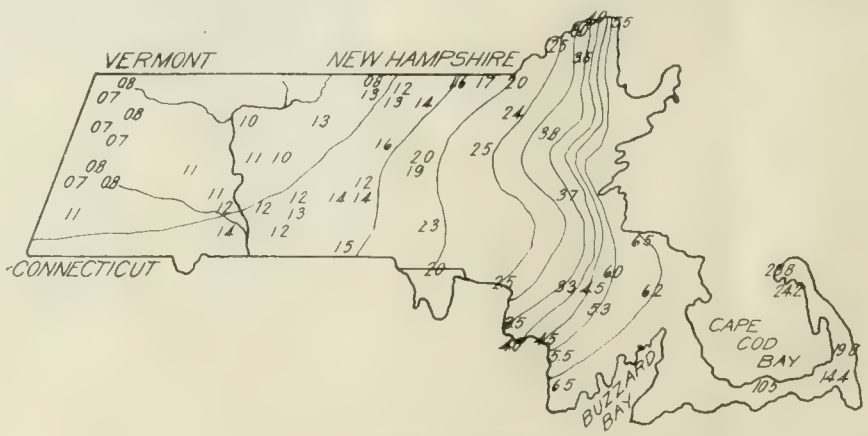


Fig. 2—Diagram Showing Normal Chlorine in Parts per Million in Surface Water in Massachusetts.

Organic Matter in Water.—We have named the elements of organic matter as carbon, hydrogen, oxygen, and nitrogen, the latter being

*A paper by L. K. Russell in the "Clarkson Bulletin" for January, 1910.

the essential element of animal life, and by its quantitative estimation we may judge the pollution of the water. This may be present in at least four combinations, and our sanitary examination includes these four determinations, viz: albuminoid ammonia, free ammonia, nitrates and nitrites.

The term albuminoid ammonia includes all the highly organized, complex forms in which the nitrogen may exist as organic matter, and is the form in which the latter enters into the water. As previously explained, we cannot distinguish by this fact alone, the source of the nitrogeneous matter, whether harmless vegetable matter, or the extremely harmful animal refuse. But once in the water, decomposition sets in, aided if not caused by the minute organisms, known as bacteria; and organized nitrogen passes from the form of albuminoid ammonia to free ammonia, remaining in this form in solution. In passing, we may remark that the animal refuse will more quickly pass through the change noted than vegetable matter. Nitrogen as free ammonia next passes by bacterial action to form of nitrites, and finally into form of nitrates. Our surface waters are high in albuminoid and free ammonia, and the ground waters in nitrates and nitrites, especially the former. In fact, the forms of free ammonia and nitrites are transition forms, while the nitrates are a permanent form, and are not decomposed by bacteria, but only by chlorophyll or green-growing plants. We judge of the nearness or of the remoteness of the pollution by the form in which we find the nitrogen present. A water high in albuminoid with some free ammonia, and nitrites, but low in nitrates, has received pollution within a short time. If these are low and nitrates high, pollution took place at a period somewhat remote. If all are present, the water has received pollution not only at a remote stage but is also receiving it at present.

Changes in Water.—If what has been said about the changes of the nitrogeneous matter entering into the water, and the part played by the bacteria and green growing plants in these changes is carefully considered, we see we have a never-ending cycle. This cycle is best illustrated by a diagram devised by Prof. Sedgewick, of the Massachusetts Institute of Technology. Fig. 1, is the diagram, as published in "Elements of Water Bacteriology," by Prescott and Winslow.

The left hand side of the diagram indicates the complex organic matter built up by the chlorophyll bodies of green plants in the sunlight from the mineral matter, i. e., nitrates, and the other half of the tearing down process carried out by the bacteria, with the accompanying changes, evidenced in our chemical examination. It is well to note that the change indicated by the left hand side of the diagram, viz: the building up of the nitrates into complex organic compound, does not take place in the case of well waters, since they are not reached by sunlight. Hence nitrates are high in ground waters.

Chlorine in Water.—Another accompaniment of animal refuse pollution is chlorine which enters the water as sodium chloride, or common salt. We must, however, take into consideration that all water has present in it some chlorides which it dissolves from the soil or which has blown into it from ocean fogs. So in our final decision of the quality of the water we must take into consideration its source and locality. Distance from the ocean, the existence of mountains between the water and the sea will regulate the amount of sodium chloride carried along by the winds and deposited in the surface waters. One very important point must be noticed in regard to chlorine, once in the water it remains as it enters. There are no such transformations as is the case with nitrogen compounds. For this reason and the fact that it is present in sewage it is looked upon as helpful determination especially in surface waters, where any considerable amount over the normal for the region leads one to view the water with suspicion. So important have the Boards of Health in some states, notably in Massachusetts, New York, and Connecticut, considered the determination of normal chlorine present in surface waters, that they have been to considerable expense to determine the amount of chlorine present in surface waters known to be unpolluted, and have published maps showing this. By comparison with the normal chlorine map of the region we may obtain an idea of the pollution of the surface water we are examining.

The Total Solids Present.—The "total solid residue on evaporation," or as it is more often called "total solids" is determined. This gives a measure of the solid matter held either in suspension or solution; and when this residue is gently ignited, (heating the outside of the dish containing the residue with the flame of the Bunsen lamp) by which means the organic matter is charred and oxidized, and thus removed, we get a measure of the carbonaceous matter present; for a second weighing will detect this removal. This is reported as "loss on ignition," or volatile matter. The difference between the weight of total residue and loss on ignition is considered to be the mineral matter.

Another method which gives a measure of the carbonaceous matter present is that of "oxygen consumed." The water is heated with a known amount of oxidizing agent, as potassium permanganate, this giving up its oxygen in proportion to the amount of carbonaceous or easily oxidizable matter present. By analytical methods we can determine the amount of our reagent so decomposed.

WATER FROM POTSDAM WELLS.
In Parts Per Million.

	Total Solids.	Nitrogen as Albuminoid Ammonia.	Nitrogen as Free Ammonia.	Nitrites.	Nitrates	Chlorine.	Oxygen Consumed	Total Hardness.

I—Does not indicate pollution. II—Indicates pollution.

Summary of Results to Be Obtained by Analyses.—The "hardness" of water determines its fitness for domestic purposes, especially for washing, as very hard water increases soap bills and is rough on hands and clothes.

In addition to the chemical tests given, a physical examination is made to note odor, hot and cold, turbidity, sediment, and color.

Under the microscope an examination is made to detect such micro-organisms as would by their growth and decay cause unpleasantness to sight, smell or taste. In some cases special samples are taken to find out the number of bacteria per cubic centimeter.

In the ways mentioned by chemical, physical, microscopical, and bacteriological tests an accumulation of evidence is obtained, from which the water analyst passes judgment upon the desirability and safety of the water for potable purposes. This is not a simple task, as there is no hard and fast line up to which the amount of a substance may go and be safe, and above which the water is to be condemned.

The task before the water analyst is not like that of the assayer who reports definitely that the ore submitted to him contains a certain number of ounces of gold per ton, but rather it is that of the physician making his diagnosis from observed symptoms. The data we have collected tells us the past and present history of the water, and with a knowledge, if possible, of its surroundings we must advise whether or not it is best to use it.

Sugar Beet Cultivation on Sewage Farms.

Mr. J. Ashton at a recent meeting of the Association of Managers of Sewage Disposal Works of Great Britain suggested the cultivation of sugar beets and the erection of small beet sugar factories on sewage farms where a porous, well drained soil can be obtained. He stated that he had grown beets in such locations as an experiment and found he could grow from 12 to 20 tons per acre on heavy soil, and from 18 to 30 tons on lighter soil; the difference comes in the suitability of the soil and its richness—the richer the soil and the more porous it is, the greater will be the crop of beet. He stated that a crop of 43 tons to the acre has been registered on the Liverpool sewage farm. Mr. Stein, a Liverpool sugar expert, believed the idea of thus utilizing sewage farms was good, but stated that a small factory was too costly. He cited an instance of work done in Belgium, where beet roots were pulped and the juice was piped to a central factory, where it was worked up into sugar. Among the 4,000 sugar beet growing experiments he had conducted in the United Kingdom in every county, the most successful were those on the sewage farms, where the yield of roots per acre varied from 18 to 41 tons. The sugar in the roots averaged 16 per cent. Germany is the premier beet growing country in the world and the yield of roots per acre is 12 tons, with from 15 to 16 per cent of sugar in the roots. In regard to this subject we note that Mr. W. C. Easdale has written to the *Surveyor* calling attention to the fact that sewage farms are not all adapted to beet growing. In addition he was afraid that wherever the sewage works manager was very successful in his farming operations he would degenerate into a poor sewage works manager and the quality of the effluent is what he should look after. Mr. Easdale believes plants for making alcohol from the beets will be cheaper than sugar factories.

Method and Cost of Reforesting the Marginal Lands of the Wachusett Reservoir Metropolitan Water Works, Boston, Mass.*

In the early development of the plans for building on the south branch of the Nashua River, at Clinton, Mass., what is now known as the Wachusett Reservoir, in which to store water for the supply of Greater Boston, the Metropolitan Water Board, largely through the efforts of one of its members, Dr. Henry P. Walcott, appreciated the fact that, unless systematically and scientifically studied and developed, the marginal lands of this great inland lake, which aggregate 3,380 acres, and in places extend back for half a mile, would become waste and valueless, a detriment to the purity of the water supply and a menace to the life of the soil. A small part of this large tract was made up of arable and pasture land which could be used for farming and grazing purposes, but on account of the fact that manurial matters would result from such utilization, all idea of allowing cultivation and pasturage was abandoned as being even more of an injury to the purity of the water supply than the non-use of the land would be. There remained but one alternative—to reforest in some way the whole or a part of this reservation. To determine the kinds of trees to be used, methods of treatment and the various other questions of policy in this reforestation, the board secured the services of Prof. J. G. Jack of the Harvard Agricultural School, a recognized authority on sylviculture.

An outline of the general policy adopted in the reforestation of the marginal lands of the Wachusett Reservoir, comprising as they did 1,090 acres of arable, pasture and light sprout land, 280 acres of thick sprouts and young, thin timber land and 1,475 acres of heavy timber or forest land, was as follows: 1st, to establish two forest nurseries, one on each side of the reservoir, for the raising from seed of coniferous trees, mostly native white pines, to form the ultimate or final forest, and of deciduous trees to act as fillers and aid in the final development of the conifers; 2d, to plant all of the first mentioned class of land with a mixture of white pines and hardwoods; 3d, to underplant the second class with white pines, making what are hereafter termed "Improvement Thinnings in Young Pine Stands," as the growth of the pines demanded; 4th, to make "Improvement Thinnings in Original Timber Stands," as opportunity permitted; 5th, to clear and maintain a fire guard 40 ft. wide around the outside limit of the reservation, to serve as a protection against fires having their origin on abutting land; 6th, to

*Condensed from a paper by E. R. B. Allardice read before the Boston Society of Civil Engineers and printed in the Journal of the Association of Engineering Societies for January, 1910.

maintain some of the present and build necessary additional internal forest roads 15 ft. wide, making accessible all areas and acting as secondary fire lines, dividing the entire reservation into lots containing from 15 to 30 acres; and 7th, to clear and maintain a 50-ft. margin along the forested portion of the flow line of the reservoir, and to plant the inside half of it with white pine and arbor vitæ closely spaced, forming an effectual screen or hedge to keep the greater part of the foliage from adjoining forests from being blown into the reservoir.

NURSERIES AND CARE OF SEEDLINGS.

Early in 1898, or about eight years previous to the completion of the reservoir, work was begun upon the preparation of the nursery on the north shore, containing 4.3 acres, and about two years later upon the one on the south shore, containing 3.7 acres. In selecting the sites, attention was given to securing land comparatively level and well drained, composed of moderately fertile, sandy loam, free from weeds and stones. The nursery on the north shore was located on land formerly used for agricultural purposes and contained couch grass in large quantities, making it very expensive to prepare for and maintain as a nursery. The one on the south shore was located within the limits of a large area covered with a stand of fifteen year old white oaks and chestnuts in a rather backward state, due to the ravages of forest fires. To prepare this area for nursery purposes, it was necessary to clear, grub, plow and harrow at a cost of approximately $200 per acre.

Seed Planting.—As the methods adopted in the raising of coniferous and deciduous trees varied somewhat, they will be described here separately, first dealing with the white pines and other varieties of conifers.

During the month of May the area to be used was plowed to a depth of about 15 ins. and then leveled up by raking with heavy iron rakes. Beds were laid out 4 ft. wide by 40 ft. long, separated by paths 1½ ft. wide. The seed was prepared by soaking in warm water for about 48 hrs. and then covering with red lead to keep off birds and rodents. A "drill board" was used for shaping the drills in which the seeds were placed, consisting of a 1-in. board, 6 ins. wide and 4 ft. long (the same as the width of a bed), fitted with a handle on the upper side for convenience in handling, and with two grooved strips about 1 in. square running lengthwise of the under side of the board at each edge, the centers being 5 ins. apart and the groove about ⅝ in. deep. For convenience in spacing the drills, this tool had at each end an outrigger or gage, consisting of a short piece of lathe, through which was driven a small nail 5 ins. distant from the center of one of the grooves.

The seed-planting gang consisted of a foreman and four laborers, divided as follows: one drillman, two sowers, two coverers. The drillman formed the drills by forcing the molds or grooves of the drill board down into the soil and rubbing it endwise. The two sowers, one of whom was the foreman, worked from opposite sides of the bed. The seed was placed in bottles fitted with wooden stoppers having a hole of the proper size to permit of one seed passing out at a time. The seeds were dropped on the edge of the drill and fell into either channel. It was necessary to go over the same length three or four times in order to get a single continuous line of seeds. This method was found to be more economical than that of allowing the seeds to run freely from the bottle, which method sows too thickly. The sowers were followed by one of the coverers, who sifted loam over the seed through a common ash sieve of ⅜-in. mesh until the drills were filled to the general level of the bed. The other coverer completed the planting by consolidating the loam with a board which he laid over the drills and pressed firmly into the ground.

It requires from two to three weeks before the sprouts appear above the ground and during this time great care has to be exercised to give the seed the proper amount of moisture. No particular rule can be laid down for this treatment, as it of necessity varies with the climatic conditions. During particularly dry seasons it was found necessary to cover the seed beds with a mulching of leaves and to water this mulch in the late afternoon about every second day. When the beds are mulched, daily examinations are necessary after the first ten days to ascertain when the sprouts have been broken through, at which time the mulching should be removed. The ideal condition is that in which nature meets all the requirements and the beds or seeds demand no artificial treatment. Unfortunately, this condition rarely if ever continues for any length of time and it therefore becomes necessary to give almost constant attention to the beds from the time the seeds are planted until the sprouts break through the ground.

During the life of the seedlings in the seed beds (one year) they had to be given considerable care to prevent "damping off." This care consisted principally of screening and watering. Light lath screens about 4 ft. square supported on stakes about 1½ ft. above the surface of the ground were used, being manipulated as the weather conditions demanded. If the season was excessively dry, it was necessary to mulch the seedlings with dead leaves and water about three times a week.

Transplanting.—The seedlings having been in the seed beds one year, the next step was to transplant them into "transplant beds," where they were spaced about 4 ins. apart in rows 6 ins. apart and left from one to three years. In doing this work a gang composed of a foreman, one lifter, three sorters and counters, one pruner, one helper and eight planters was found convenient.

With a common garden spade the lifter removed the seed beds and they were sorted, counted, pruned and puddled. When the seedlings were taken from the seed beds they were first sorted, separating the strong and weak specimens. Then the long, fine, feathery roots were cut off at the bottom of the stocky part with a butcher's cleaver. The next step was to cover the pruned roots with a thick puddle, prepared by thinning heavy swamp muck to the consistency of thick gruel, after which they were immediately heeled into the ground ready for the planters.

The transplant beds were prepared in the same manner as the seed beds, and the plants or trees were placed in them by means of a common mason's trowel. A good planter should plant about 3,000 trees per 8-hr. day. While in the transplant rows the only care necessary in the summer time was to keep the beds free from weeds, which was done with small hand cultivators. During our treacherous New England winters we are very liable to experience short, heavy thaws, which penetrate the ground to a depth of 3 or 4 ins. and heave the young transplants out, especially if they were transplanted the previous fall, as the roots do not have time to become well established before being exposed to this severe treatment. When this happens, they must be immediately pushed back into the ground or they will be frozen to death. This work should be done as rapidly as possible because of the liability of a freeze setting in at any time. Very little attention is given while pushing the seedlings back into the ground to keep from bending or crooking the small stems, as the seedlings are being raised for our own use and their value does not in any way depend upon their appearance. So long as nothing is done to injure the growth of the tree, our requirements are met. Caring for the seedlings at such times is given much more attention, however, by nurserymen, as their appearance is quite a factor to their value.

Field Planting.—Our practice has been to divide the work about equally into spring and fall plantings, and time fails to show any difference in the results obtained. Most of our plans have called for the planting of from 50 to 100 acres of ground in both spring and fall, the former taking place immediately after the frost left the ground and before the trees began to grow, while the fall plantings have generally been made after the fall buds had set, depending largely upon the season. One planting, however, was made in August, and that, although experimental, proved a decided success, in spite of the fact that the trees were four years old and the season immediately following extremely dry. During the following fall these trees suffered some kind of a shock which apparently killed them, the needles all turning brown, but they have since recovered and are now among the finest stands we have.

Planting gangs are composed of a foreman and about thirty men, five of whom are engaged in the nursery preparing the trees for the field in the same manner as for transplanting. The field part of the gang is divided into pairs, one man making the hole for the tree with a common mattock, the other placing the tree and compacting the earth firmly about it. The work is very interesting because of its simplicity and rapidity. The men are lined up in pairs in a diagonal position on the field, the leader with a mattock and the planter with a pail filled with about 100 trees. The first pair are shown a previously established line, stone wall or fence to guide them, while the others in succession, with the aid of one man especially assigned to the duty, plant parallel to and at a given distance from the preceding pair. The spacing in the rows is done by pacing. In the easiest plantings, such as open pasture or light grass land, the leader opens the ground with two strokes of the mattock, the first one being made with the axe blade and the second with the grub blade, cutting the ground just below the top of the first cut. With the grub blade of the mattock in its position at the end of the last stroke, the ground is pulled up and back while the planter places the tree in the hole. While the leader is pacing the distance to and preparing the next hole, the planter compacts the earth about the tree by forcing his heel into the sod. With a well-organized and experienced gang, a pair of men will plant about 2,000 trees in a 9-hr. day, or 1,000 trees per man, at a cost, including the nursery work, of about $3.25 per 1,000 trees.

Great care has to be given during this work to see that the roots of the seedings are not "root bound" when placed in the ground. The covering of the roots with thick puddle naturally binds them together and, unless they are shaken out before being planted, the growth of the tree will be greatly retarded.

The above description and rate are applicable only to first-class planting areas, the methods varying and the cost increasing according to the nature of the ground. For instance, in heavy grass land it is necessary to remove the sod from an area about 6 ins. square, requiring three or four strokes of the mattock, before making the final hole as described above. In sprout land or grown-up pasture the speed is necessarily slower because of the interference of the trees. The maximum cost per 1,000 trees was $7.87.

Thus far we have considered and described the methods adopted in the raising of white pine and other varieties of coniferous trees from the time the seed was sown until they were placed in their final location in the field. Remarkably successful results with these varieties have been obtained, 90 per cent of the trees placed in the field having lived, and great credit is due the men who outlined and instituted the system. We, as engineers, are frank in admitting that at times we learn fully as much from our unsuccessful ventures as we do from the successful ones.

Composition of Plantings.—Thus far we have considered and explained the work so far as the methods of raising forest trees from seed and planting them into the field are concerned. Now let us deal with the make-up or composition of the seeding stands.

The original condition of the area to be treated being so varied, it was necessary to vary the composition of the artificial stand to meet the requirements of the individual lot. In the main, the plantings comprised white pines planted 10 ft. by 10 ft. apart, using oaks, chestnuts and maples as fillers, making the final stand with trees 5 ft. by 5 ft. apart, the theory of this composition being that the hardwoods, growing so much faster than the pines, would thrash their young, tender limbs, thereby forcing them to grow upwards and develop a long, straight,

clear log. This type of planting required 435 pines and 1,307 hardwood trees per acre and was used in arable, open pasture and light sprout land.

In the thick sprout and young, thinly grown timber land, the pine seedlings were used to underplant the sprouts and interplant the open areas of the timber land. No set rule could be established for the spacing in this type of planting, as it varied with the existing growth. It would be safe to estimate from 500 to 800 trees per acre.

The first plantings were made during 1902, and from then up to the time that the failure of the hardwoods (1906) was discovered, the mixed type of planting was used. Since that time no hardwoods have been planted and the pine seedlings have been spaced 6 ft. by 6 ft. apart in the field, this close spacing being adopted so that the limbs might thrash and kill each other, thereby obtaining the same results as with the mixed stands. This spacing required 1,210 trees per acre.

Improvement Thinning.—We are told by forestal experts and advocates that the pines need no attention after planting in the field until such time (about 15 yrs. afterwards) that the first thinning is necessary. This is true only so far as it deals with the planting of arable and open pasture land. One of the main arguments in favor of reforestation is that sprout and scrub lands may be converted into paying timber land by simply raising and planting the young trees. While I would not go on record as making any statements detrimental to the growth and advancement of this great industry of forestry, which is one of the foremost questions before our country to-day, yet I believe that, for the good of its development, it is necessary that this article contain all the facts as we have found them.

A large part of our reservation was covered with sprout and scrub growth, which has been and was originally intended to be underplanted with pines. About the only requirements for a vigorous growth are plenty of light and fresh air, and we all know, if only from occasional observation, that neither of them is found under such a ground cover. When planted in this kind of land, the pines grow up in a rather delicate condition, until their tops encounter the low-lying limbs of the surrounding growth. At this stage it is absolutely necessary to give them assistance if they are to survive. This we have found can be done for about $6 per acre, the method being to cut out all growth which is in any way, at this time or within the next few years, liable to stunt or kill the trees. The wood cut at this time has very little value as cord wood on account of its small size, so it has been piled in windrows between the pines and left to rot, or deposed of for pea brush.

In doing this work due care is taken to preserve all valuable specimens of trees and to leave sufficient fillers of any nature whatever which will act as crowders to the pines.

Our aim in all branches of the work thus far described has been to secure ultimately a sound, healthy stand of pure white pines, having from 250 to 350 trees per acre.

As considerable of the reservation was originally covered with timber stands varying from 15 to 50 yrs. of age, which had been left to take care of themselves for years past, it has been our practice to make improvement thinnings in them by cutting out the poor, weak specimens, and such of the hardy ones that were overtopping or crowding the young vigorous growth. In a stand of 25-yr.-old maples and chestnuts intergrown with gray birch, a thinning such as described above, which included the cutting out of all the birches, was made at a cost of $28.50 per acre. There is considerable revenue derived from the sale of cordwood made at this time, which has, under the most favorable conditions, paid for the labor. Undoubtedly additional thinnings will have to be made from time to time, taking out the weak and overtopping specimens, which in all probability can be done at a profit. By this method the maximum returns per acre will ultimately be secured.

Fire Protection.—Among the greatest dangers to the forests are fires and, in order to prevent their spreading to or from abutting property, and to provide a line of defense on which to fight them, a "fire guard" 40 ft. wide has been cut around the entire outside limit of the marginal lands of the reservoir. There is also a network of "forest roads" 15 ft. wide throughout the reservation, which acts as supplementary fire protection. The brush and weeds are cut from these two protective systems once every year. A double furrow has been plowed along that portion of the fire guard where there was no stone wall to check the advance of creeping fires from neighboring property.

On holidays and Sundays, during the dangerous seasons of the year (early spring and late fall), men armed with fire extinguishers patrol the reservation to further protect it from the ravages of forest fires.

Thus far no serious fires have occurred, though several have started which would have caused great damage but for the effectual protection given.

Reservoir Marginal Screen.—In order to have an effectual screen along the forested portions of the shore of the reservoir, which would prevent the foliage from the deciduous trees from being blown into the reservoir, three rows of white pines spaced 6 ft. apart each way, and two rows of arbor vitæ 2 ft. apart, trees 3 ft. apart in the rows, have been planted on the back half of the 50-ft. reservoir margin. The greater proportions of the arbor vitæ have failed, probably because of having been planted in the field when too young (two or three years old) to endure the severe exposure which prevails along the shores of the reservoir.

At the time of sowing the arbor-vitæ seed, a much larger quantity was used than was needed for this purpose, so the seedlings which remained after the planting was done have been transplanted into transplant beds in rows 12 ins. apart with the trees 6 ins. apart in the rows. These trees have now been in the transplant beds two years, during which time they have been pruned once, with the result that we now have available a sufficient number of strong hardy specimens with which to replant the entire 32 miles of flow line. This will require about 113,000 trees, spaced 3 ft. apart in rows 2 ft. apart, breaking joints, so to speak.

The Tables I, II and III show that it costs about $15.40 per 1,000 trees, or $19.20 per acre (1,390 trees per acre), to raise the trees from seed, prepare, plant and protect the lands planted, through the time of the final planting in the field; that it costs about 22 cts. and 31 cts. per year respectively to maintain efficient fire protection; that in sprout and scrub land it costs about $4.25 and $6 respectively for an improvement thinning, which will probably have to be made twice during the first ten years, after which time the trees should care for themselves.

TABLE I.—WORK ACCOMPLISHED TO DECEMBER 31, 1908.

Total area of nurseries	8.0 acres
Total area planted	1 330 acres
Total number of trees planted:	
Coniferous	948,000
Deciduous	902,000
Total length of reservoir margin planted	32.0 miles
Total length of fire guard cleared and maintained	20.8 miles
Total length of forest roads cleared and maintained	30.0 miles
Planted area thinned	488 acres
Original timber stands thinned	209.0 acres

TABLE II.—COSTS OF WORK. WAGE RATE, $1.75 PER 8-HOUR DAY.

Nurseries:	
Clearing nursery on south shore	$200 per acre
Maintenance of nursery, first year seedlings	$1.50 per 1,000 trees
Maintenance of nursery, second and third year seedlings	$1.75 per 1,000 trees per year
Plantings:	
Clearing areas preparatory to planting	$4 per acre
Transplanting seedlings from nursery to field	$5.25 per 1,000 trees
Transplanting seedlings from nursery to field	$5.50 per acre (6x6 ft. planting)
Improvement thinnings:	
Among planted trees	$6 per acre
In original timber stands	$20 per acre
Fire Protection:	
Clearing marginal fire guard (40 ft. wide)	$150 per mile
Maintaining marginal fire guard	$27 per mile per year
Clearing and grading forest roads 15 ft. wide	$120 per mile
Maintaining forest roads	$8 per mile per year
Maintaining fire patrol	$100 per year

TABLE III. — REFORESTATION: SUMMARY OF COSTS ON PLANTED PINE STANDS; WAGE RATE, $1.75 PER 8-HOUR DAY.

Item.	Per 1,000 trees planted.	Per acre planted.
Preparing nurseries	$0.40	$0.60
Seedlings (1 year)	1.50	2.25
Transplants (2 years)	3.50	4.50
Preparatory clearing	3.00	4.00
Field planting	5.25	5.50
Clearing 40-ft. fire guard	0.75	1.00
Clearing 15-ft. forest roads	1.00	1.35
Maintaining 40-ft. fire guard (per year)	0.14	0.19
Maintaining 15-ft. forest roads (per year)	0.06	0.09
Maintaining fire patrol	0.02	0.03
Improvement clearing	4.25	6.00

The credit for the marked success of this work is here given to Dr. Henry P. Walcott, of the Metropolitan Water and Sewerage Board, and president of the Massachusetts Forestry Association; Frederic P. Stearns, chief engineer of the Metropolitan Water Works during its conception and the greater part of its development; and Hiram A. Miller, who, while engineer of the reservoir department of the Metropolitan Water Works, had charge of the planning and beginning of this work.

Method of Recording Test Borings for Sewer Construction at Louisville, Ky.

By Roger DeL. French.

The city of Louisville, Ky., is at present engaged in making extensive additions to its sewerage system, funds for which are provided by a bond issue of $4,000,000. The work is in charge of a commission of five members, appointed under special legislative authority by the mayor. All sewers over 24 ins. diameter, are constructed of concrete, plain or reinforced; sewers less than 24 ins. diameter are of vitrified pipe. Practically all construction work has been carried on by contract; two or three small jobs only having been constructed by day labor under direction of the commission.

Form No. 1

COMMISSIONERS OF SEWERAGE
OF LOUISVILLE, KY.
ENGINEERING DEPARTMENT

RECORD OF BORINGS

Location of Hole.....

Date	No. of hole	Station No.	Elevation of hole

Kind of drill	Cost of hole	Time of boring

Surface of ground

Total depth of hole — Details of material penetrated

Remarks:

Observer

Wash borings are taken on the line of proposed sewers by a superintendent and (usual-

ly) four men. Oftentimes a bore hole can be put down to its full depth with a post-hole auger, but small holes require to be cased with 4-in. pipe, and sunk with a sand pump. Results of borings are reported on a blank like Fig. 1. This is self-explanatory, and on the back are kept rates relating to the details of equipment used, time spent in boring, time spent in moving from hole to hole, etc. The cost of these holes has run from 2 cts. to as high as 20 cts. per foot, according to location, material penetrated, and number in one group. Four men and a superintendent can put down an average of 180 lin. ft. per day of 8 hrs., in the clay, sand and gravel underlying Louisville.

Construction work is divided into three districts, each in charge of a Resident Engineer, assisted by as many inspectors, field parties, etc., as occasion demands. In addition there is the Headquarters Division in charge of a Designing Engineer, assisted by draftsmen, laboratory force, cash keeper, etc. All employers are required to keep time sheets, on which their time is charged to the various contracts, or if not chargeable to a contract, then to the particular work in hand. The series of blanks used in keeping records of cost were illustrated and described in ENGINEERING-CONTRACTING for Nov. 17, 1909.

Cost of Cleaning Catch Basins, Borough of Brooklyn, New York City.

The following costs of cleaning catch basins in the Borough of Brooklyn, N. Y., are taken from the annual report for the year ending Dec. 1, 1909, of Edwin J. Tart, Chief Engineer of Sewers for that borough:

Year.	Number of Basins.	Number Examined.	Number Cleaned.	Soil Removed Cu. Yds.	Cost per Basin.	Cost per Cu. Yd.	Number Cleaned of Snow.
1905	9,257	40,242	17,254	25,512	$1.79	$1.23	14,375
1906	9,537	19,768	25,386	33,423	1.65	1.25	5,999
1907	9,979	42,327	24,389	35,272	1.63	1.12	9,674
1908	10,127	47,933	30,693	44,476	1.60	1.10	5,423
1909 (11 mos.)	10,285	54,530	30,619	36,699	1.54¾	1.35	5,615

The foregoing figures indicate a cleaning about three times each year; a better record than many cities make. Considerably more than one cubic yard was removed at each cleaning. The method of measuring is not stated.

A resolution was recently passed by the Engineers' Club of St. Louis urging the passage of such laws by congress as would provide for a Department or Bureau of Public Works, to include Coast and Geodetic Survey, Geological Survey, Reclamation Service, River and Harbor Improvement and such other branches as may be rationally classed under one general department. This department is to include all competent engineers who may be in the employ of the Government at the time the department is organized. The following plan is advised when additional employes are to be appointed. They shall be men of suitable age, experience and education, selected in accordance with the U. S. Civil Service Commission regulations without regard to the school or college, whether civil or military, from which they came. The compensation shall be commensurate with the importance of the work and the degree of experience and ability required, promotion to be based on merit and seniority in service. In case congress shall decide to postpone the organization of such a department, it is urged that the pending bill be modified and appended as far as practical in accordance with the resolutions, to the end that civilian engineers may be entitled to the same emoluments, rank and tenure of office as Engineer Officers in the Army occupying similar positions.

Excavation On the Panama Canal in January.—The total amount of excavation on the Panama canal during the month of January was 2,831,929 cu. yds., 20,248 cu. yds. more than during December. Of this amount 1,728,755 cu. yds. was dry excavation removed principally by steam shovels. The dredges removed 1,103,174 cu. yds., in addition to the large amount pumped into the Gatun dam by the suction dredges.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

The Preservation of Timber Used in Mines.

Mr. John Macoun in a paper read recently before the Canadian Mining Institute stated that protection of underground timbers by creosoting was too expensive and had not always proved a sure preventive of what is generally termed "dry rot." Apart entirely from the great expense usual preservative methods entail, the conditions are so vastly different that it is more than doubtful whether the results of open air experiments are of much value when applied to deep mines. He recommended the Henry Aiken method for preserving timber in mines and gave the following data:

In this process the timber is soaked in water, raised to a temperature of from 190° to 200° F., and contains enough common salt to form a thoroughly saturated solution. The timber should be free from bark, fairly well seasoned and thoroughly dry. Tests made in many British collieries have proved conclusively that this treatment is in every way a satisfactory one. In one mine the timbers, after being in place five years, were perfectly sound and in another they had shown no sign of rot at the end of six years. What is even more noteworthy is an experiment made in Fifeshire. Two pieces of ordinary fir, 3½ ins. in diameter and 3 ft. long, both weighing 10 lbs., before being treated, were selected. One of the pieces was treated by the salt process and the other not. After being treated it weighed 12 lbs. Both were taken underground and placed in a return air course and after 11 months were examined and reweighed. The untreated timber then weighed only 5 lbs., whereas the treated wood weighed 12 lbs., or exactly the same weight as when it was put in. They were replaced in the mine and allowed to remain 11 months longer, with the result that the untreated timber weighed 6 lbs. and the treated timber weighed 11¾ lbs. They were again replaced in the mine, and after an exposure of three years they were examined and while the treated piece was sound the untreated one was decayed. Such evidence as this must be considered as conclusive, and as the salt water treatment is inexpensive, there seems to be no good reason why all mine timbers should not in future be treated in this way. Timbers already in place might from time to time be sprayed with salt water, for while such treatment could not be expected to prove as efficacious as if the wood were treated, fungus spores could not develop on wood that was so treated. In coal mines where spraying is systematically done for the purpose of preventing coal dust explosions the addition of salt to the water used would entail very little extra expense. What is certain is, that when the greatly enhanced price of timber in recent years is taken into consideration, the cost of treating mine timbers with salt is insignificant as compared with the money that would be saved.

All timber used in mines is not subject to dry rot and the amount of timber used depends largely upon the system and upon the character of the walls. The *Mining and Scientific Press* is authority for the statement that timber to the amount of 4.5 cu. ft. per ton of ore is used at the Bodie mine, while at the Ontario 100 tons may be produced using only 6.25 cu. ft.

LETTERS TO THE EDITOR.

Suggestions Wanted for a Cost Keeping System for a Large Earth Dam Job.

Sirs: I have been placed in charge of construction of the Patillas Dam of the Porto Rico Irrigation Service as described in your issue of Jan. 19, 1910. I would like very much to get a very close cost account on same and wish that you and the readers of Engineering-Contracting would offer suggestions as to the best methods of keeping the data obtained. The contract was signed up on Jan. 18, 1910, for $468,150, and the contractors are actively engaged in preparing for work, getting machinery, etc. The dam proper will be built by excavation of material with steam shovels and hauled with locomotives and the material sluiced in place.

As I am sure the readers of your paper will be interested in this class of construction, would like to get close cost data and afterwards publish same in your paper.

Yours,
FULTON PACE,
Assoc. Mem. Am. Soc. C. E., Division Eng.
Patillas, Porto Rico, Feb. 21, 1910.

(Suggestions from our readers are invited. The new book by Gillette & Dana entitled "Cost Keeping and Management Engineering," published by the Myron C. Clark Publishing Company, Chicago and New York ($3.00), we believe should be of considerable assistance in devising a cost keeping system for this dam.—Editors.)

Information Wanted About Automatic Regulating Dams.

Sirs: Will you kindly advise me whether you know of any form of sluice gate or flood gate in general use, for carrying off the surface water that collects above the gate and is closed by the tide on the lower side. I have been informed that the British Government has adopted a general plan for sluice gate, which is also extensively used in Canada. The gate swings on an axle placed about ⅓ of the distance from its top to its bottom, the top portion swinging up stream between the walls when the gate is opened, thereby giving it a horizontal position with the water. The advantages claimed for it are that drift wood has no chance to stop the gate from closing. "SUBSCRIBER."

(If any readers of this paper know of dams of this type being in use full information will be appreciated. A number of types of movable dams are described in the standard works of Frizell, Mead, Beardsley & Wilson. —Editors.)

How to Increase the Efficiency of the Civil Service.

Sirs:—In reading over your editorial on the administration of Civil Service as applied in Chicago (although the city was not mentioned), I wish to make a few remarks based on personal experience and observation.

The great trouble in administering the present Civil Service law is the presence, or rather the dominance, of politics. The Civil Service Commission is appointed by the Mayor and frequently attempts to justify its existence by catering to his party's political needs and desires. Many department heads are also appointive. Naturally they seek to oust the present incumbents and install their friends. Despite the apparent present rigid law they often succeed in doing it.

What happens then? The eligible list (being of two years' duration) has expired. Does the Commission hold an examination at once? No. The political department head fills the place with a "60 day" appointee. There are cases where the "60 day" man has been kept in office by repeated certification for years. This is demoralizing to real civil service men. Under such ad-

ministration they dare not protest. Few men now-a-days care to sacrifice a good job for principle.

As to probation. At the present time all appointees are certified subject to a six months' probation. That is, the head of a department can discharge an incompetent party without filing charges against him within this period.

As to conduct of examinations apparently there are no fair rules governing the rating of experience. Recent examinations show this. Where the commissioners or their hired examiners exercise discretionary powers they fail miserably. Since experience is judged from a written personal record the candidate is known to the examiner. Naturally a political "friend" will stand high in such an "experience" test. No. It is hard enough for a man to get into the service nowadays without lifting the bars that keep him employed as long as his work is satisfactory.

The trouble with the rank and file is due to the department heads when they in turn must do the bidding of the political party in power. It might be mentioned that the tendency of the times is for more, or rather complete, Civil Service selection of city employes. What is the Commission form of government but the selection of the most fit of the candidates presented? Members of such a commission have been subjected to a public civil service examination. They can be recalled if need be and this is a form of trial. We want complete civil service from the Mayor down. Until that time you will have waste, scandal and graft.

Respectfully yours,
"A Civil Service Man."

Chicago, Ill., Feb. 4, 1910.

Sirs:—Apropos of your editorial on civil service, I desire to state the cause of the deadening of interest among civil service employes, causing them to work with a lack of that snap and vim which is supposed to characterize the work of engineers employed in private enterprises.

In assuming that there is something wrong in engineering civil service you are entirely right; but the remedies you suggest are negative and insufficient. Your suggestion of dropping from the service men who fail after one year's service, or after five years' service, to measure up to a required standard to be determined by examination, would drive men to work harder at times immediately preceding examination, but it would not inspire any engineer to work at his daily task with a joyful snap and energy.

What is needed is a cause for hope, an antidote for discouragement, a financial reward for proven merit.

The writer has been employed for a number of years as a transitman and assistant engineer under New York City civil service, in one of the largest engineering departments under the city government. My deductions as to what is wrong with engineering civil service are intended to apply in particular to New York City conditions. Here since the panic of 1907 not more than 10 per cent of all the transitmen, draftsmen and assistant engineers have received any increase in salary. The result is natural. The men are discouraged, and the work drags.

On one hand are the wide-awake civic associations bent upon securing economy in government. In the eyes of these people all salary increases are detrimental to the public welfare. The newspapers toady to these societies and emphasize their views. Finally the political head of department is now, after numerous "investigations," afraid of the criticism of civic associations and dares not raise salaries for fear that it will react against him on election day. Is it strange that even engineers do not put spirit into their work under these present-day conditions? What draftsman who has not had an increase in salary for three years, will get out a drawing as quickly as he would if his efficiency were being rated to estimate his claims for an increase in salary at a definite set time?

A well regulated business concern announces a list of promotions and increase in salary at a definite date each year, generally on Jan. 1. Much has been said and printed of late concerning the need for application of business principles in municipal administration. Here, then is a true business principle—reward merit by increase of salary at a definite date yearly. In the haste to secure economy, this principle has been all but forgotten. Is there need to inquire further as to why employees are not working with vigor?

Now attack the problem in a practical manner. Transitmen and draftsmen should be appointed to the city service at the present minimum salary of $1,200 per annum. Of these men, those who measure up to a required standard of efficiency, should be advanced yearly, on a definite date, a minimum of $150 or a maximum of $300. For efficient employees, these advances should continue with regularity until draftsmen and transitmen receive the maximum salary of $1,800 a year. Then these men should be permitted to try a promotion examination for assistant engineer, and when vacancies occur in the department, those men on the list who possess the essential character for the positions should be promoted to assistant engineer, and the minimum salary for this position should be $1,950 per annum. Assistant engineers who prove efficient, should be advanced in salary, yearly, on a definite date, either $150 or $300 until a maximum salary of $3,000 per year is reached.

There is an old adage which relates that more flies can be caught by molasses than by vinegar; in the civil service among engineering employees, more efficiency can be secured by a system of rewards than by a policy of cutting.

Respectfully yours,
"Civil Service Engineer."

New York, N. Y., Feb. 7, 1910.

Power Required to Hoist a Car Up an Inclined Plane.

Sirs: I am unable to find a formula for calculating power required to hoist a car (rolling load) up an inclined plane.

M. G. GUSTIN.

Manhattan, Kas., Feb. 28, 1910.

(On page 244, 26th edition of *Molesworth's Pocket Book* the following formulas are given for rope inclines. The ton in all English books is the long ton of 2,240 lbs.:

W = weight of one train in tons (vehicles only).
w = weight of the load (passengers or goods) in tons.
y = weight of the cable in tons.
r = resistance on the level = say 0.006 at slow speeds.
$\frac{1}{x}$ = rate of inclination.
V = velocity in miles per hour.
$H.P.$ = actual horsepower required, to which should be added 25 or 30 per cent. for contingencies, friction of rope, etc.

$$H.P. = 6V\left[\frac{W+w+y}{x} + r(W+w+2y)\right]$$ for single ropes.

$$H.P. = 6V\left[\frac{w+y}{x} + 2r(W+w+y)\right]$$ for double rope.

"TAIL-END" SYSTEM.

This formula is based on the assumption that the vehicles of the ascending train are balanced by those of the descending train.

$$H.P. = 6V\left[\frac{W+w+\frac{y}{2}}{x} + r(W+w+4y)\right]$$ for endless rope.

EDITORS.]

Is the Present Method of Design of Concrete Bridges Unduly Wasteful?

Sirs: In the light of my own experience the question sometimes occurs to me: Is our accepted method of design for reinforced concrete structures, especially bridges and culverts wasteful of material and founded on an incorrect application of the principles involved, or wrong assumptions of the behavior of the materials in question, under stress? A few years ago while acting at County Surveyor I sent out a number of circular letters to road officials—not forgetting the County Commissioners—regarding the adoption of concrete as a material for bridge and culvert purposes. This vaccination process "took," and our Board of Commissioners at once got busy investigating the concrete bridge. At length they asked me to accompany them to look at some small bridges that had been built in a neighboring county and which they had been asked to examine by the construction company that had erected the same.

These were ordinary highway bridges, designed by "rule of thumb" and were the first product of the newly organized company that was trying to push the concrete bridge business in that territory. The bridges were in use at the time of our visit, having only been opened for traffic a short time. To the eye of the engineer they were rather crude in design, and the construction was not of the best, and the finished product did not present a very flattering appearance, but my board took to them wonderfully, and decided on the spot that they would submit alternative propositions to bidders and in that way find just what the difference in cost would be between the combination steel and wood, and tne reinforced concrete bridge for several structures for which they were soon to advertise for bids.

Knowing that the cost of the concrete bridge would be considerably more than the steel and wood bridge, especially as the bridge company who held this territory was bound to make a strong fight to keep out the interloper, and hold their grip on the territory, it was necessary that the cost of the concrete be held down to the lowest possible limit in order that it might receive consideration in the competition. With this end in view the standard plans of the concrete bridge company were overhauled and changed in some respects, not only to cheapen the work, but to secure a better distribution of the material, to make a better appearing job when finished, and to add to the factor of safety—if it could be said that their designs possessed that factor.

We were so far successful that concrete was awarded the place for six bridges, of from 35 to 50 ft. span, although the cost was still considerably above that of the steel people. These six bridges were built under my supervision, and at the end of 28 and in some instances of 30 days were tested with a very heavy traction outfit—which in this locality represents the maximum loading for highway bridges—and in every instance they passed the test successfully, and I may say that after three years of constant use they are still answering all demands upon them. One 50 ft. span tested at 28 days, showed a deflection of 3/16 in. under a center load of 14 tons on four wheels with axles 8 ft. apart, and as the load was removed the bridge recovered its normal position. All these six bridges were subjected to the same test, and all gave equally good results.

Now these bridges were constructed by a company new in the business—not yet having passed beyond the experimental stage—and their entire equipment was crude and inefficient, their workmen inexperienced, and with the exception of one man who had served on the Government work on the Hennepin Canal, were all having their first taste of concrete construction. Under these conditions it may be considered not strange that as the time approached for the testing of each bridge I had some uneasy feelings.

Coming to the design of these bridges, I will say that they were all of the girder type, there being four girders under each span and the outside girders being carried up to a point 12 ins. above the floor line to form a parapet wall, which was surmounted by a gas pipe railing. These girders run in depth from 12 ins. to 16 ins. owing to the length of span, the 50 ft. spans having the 16-in. girders. The floor slabs which were built continuous with the beams were 6 ins. in thickness at the outer edges and crowned to 9 ins. at the center. The lower side of the slab was arched between the girders—slightly. The reinforcement of the girders consisted of five corrugated bars, in size from ¾ in. for the shorter spans to 1¼ ins. for the 50-ft. spans. The floor slabs were reinforced with a single layer of expanded metal, placed near the bottom of the slab, and a narrow strip of the same was run in the parapet walls. A comparison of these bridges with the standard plans as sent out and recommended by different makers of

reinforcing material will show their great deficiency in depth of girder and also in some cases in the quantity of reinforcement used, yet these bridges are in constant use and there has not a single crack developed in any girder.

These bridges are freaks possibly in design, but if so, must certainly be regarded as such in point of behavior. Whether the extreme care used to secure a perfect concrete, and a correct placing of the reinforcement, or the providence that overlooks fools is to be regarded as the solution, I leave to others. Certainly in the light of this experience I may be pardoned if I sometimes think that in our desire for safety we permit ourselves to go to unwarranted extremes. Certainly it will not be denied that if concrete is to come quickly into its own as a bridge material, we cannot afford to sacrifice a due regard for economy to an undue desire to secure unwarranted and unnecessary strength.

In this connection it may occur to others as it did to me, Are we ever justified in adopting doubtful expedients to overcome obstacles to the advancement of the common good? My defense must be that as the contractor was under heavy bonds and the specifications called for the test on the bridges that I have named, that if the bridges were to fail under the test he would be the loser and the public was amply protected. And as I had materially strengthened his bridge plans before these were constructed, it must be argued that he was now building a better bridge than those that he had already built, and which were in successful use.

I might say in conclusion that this same construction company now has a very large number of such bridges in this section of the state and in Oklahoma, and Colorado, and so far have not a single failure to its discredit.

Hence again the question, "Is our present method of design unwarrantedly wasteful?"

Yours truly,

O. T. REECE.

Wellington, Kan., March 17, 1910.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

Notes from Technical Societies.

Engineers' Society of Western Pennsylvania.—At the regular monthly meeting, Mar. 15, President E. K. Morse, in response to a request made by the Pittsburg Chamber of Commerce, appointed the following committee to report on the question of raising the bridges over the Allegheny River at Pittsburg: Geo. S. Davison, Julian Kennedy, F. L. O. Wadsworth, John N. Chester and Emil Gerber. The importance of the questions involved, both engineering and financial, may be realized from the fact that there are eight bridges affected, over a river averaging 1,000 ft. in width, the majority of which would be replaced in toto. A paper on the "Floods in the River Seine" was read by Thomas P. Roberts of the U. S. Engineer's Office, Pittsburg.

Canadian Cement and Concrete Association.—Among the papers to be presented at the annual convention to be held at London, Ont., March 29 to April 1 will be the following: Richard L. Humphrey, Director of United States Structural Materials Testing Laboratories, Philadelphia, "Concrete in Europe"; Cecil B. Smith, of Smith, Kerry & Chace, Toronto, "Concrete Construction"; F. S. Baker, President Royal Architectural Institute of Canada, "The Use of Cement in Architecture"; A. W. Campbell, Deputy Minister of Public Works, Ottawa, "The Engineer and the Finished Work"; Professor W. H. Day, Ontario Agricultural College, Guelph, "Cement Tiles"; A. W. Connor, of Bowman & Connor, Toronto, "Municipal Concrete Bridges"; Gustave Kahn, Toronto, "The Commercial Aspect of Reinforced Concrete Work in Canada"; C. R. Young, of Barber & Young, Toronto. "An Analysis of Concrete Bridge Failures"; M. D. Morrill, Architect, Washington, D. C., "Inexpensive Homes of Concrete"; D. C. Raymond, Vice-President Bishop Construction Co., Montreal and Toronto, "Concrete from the Contractor's Standpoint"; Charles Talbot, London, Ont., "Highway Bridge Construction"; Philip Wormeley, United States Department of Agriculture, Washington, D. C., "The Uses of Concrete on the Farm"; James Pearson, Contractor, Toronto, "Concrete Pavements"; C. W. Boynton, Chief Inspecting Engineer, Universal Portland Cement Co., "Concrete Sidewalks"; R. A. Plumb, Detroit, Mich., "Waterproofing." In addition to the list of speakers given, a very important feature of the convention will be the discussion and subsequent designing of Standard Specifications for Cement and Concrete Work with special reference to the adaptation to Canadian business and climatic conditions.

Personals.

Mr. Hudson F. Layton, Civil and Consulting Engineer, Pittsburg, Pa., will on April 1 move his offices to Suite 2501 Henry W. Oliver Bldg., Pittsburg, Pa.

Mr. S. D. Newton, who recently retired as City Engineer of Knoxville, Tenn., has opened offices in that city as a civil and consulting engineer. Mr. Newton will make a specialty of municipal work.

Mr. R. L. Murphy has resigned as District Sales Manager for the Corrugated Bar Co., at St. Louis, and has been elected treasurer of the Murphy Construction Co., General Contractors, E. St. Louis, Ill.

Mr. John M. Price of Atchison, Kansas, noted as a pioneer railroad contractor, and who built the Rule Branch of the Chicago, Burlington and Quincy R. R. from Atchison to Falls City in 1869, died March 10.

Mr. Walter B. Snow, publicity engineer, 170 Summer street, Boston, Mass., has added to his staff Mr. Benjamin Baker, formerly of the "Boston Transcript," and late editor of "The Navy," and Mr. Herbert M. Wilcox, a chemical engineer with a varied industrial experience.

Mr. Ernest McCullough, who since July 1, 1909, has been a member of the editorial staff of Engineering-Contracting, has resigned to accept a position on the editorial staff of the Railroad Age-Gazette. Mr. McCullough's headquarters will be at the Chicago offices of the last named paper, 305 Dearborn street, Chicago, Ill.

Mr. C. A. Greenidge, late general manager Electric Department Utica Gas & Electric Co., and for a number of years engaged in a varied mechanical and electrical engineering practice, has been engaged by J. G. White & Co., Inc., as engineer in charge of the operating department. Mr. Greenidge is a graduate of Stephens Institute of Technology.

Mr. H. B. Kamschutle, for many years chief engineer of the T. M. E. R. & L. Co., and the T. M. L. H. & T. Co., and Mr. G. Pickhardt, formerly with the Milwaukee Western R. R., have formed a copartnership for engaging in large building and railroad contracting. They will work under the firm name of Kamschulte-Pickhardt Engineering & Contracting Company with offices at 711 Majestic Building, Milwaukee, Wis.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Nazareth Portfolio.—Charles Warner Co., Wilmington, Del.

The Nazareth Portfolio is a heavy envelope containing loose sheets 7½x9 ins., each sheet giving information on the use and abuse of cement.

Tools for Draftsmen and Artists.—Paper, 6x9 ins., 72 pp. The Lutz Co., Guttenberg, N. J.

While this catalog contains the usual things seen in catalogs of office tools, it shows on page 50 a convertible scale for draftsmen that is new and good.

Nestable Corrugated Metal Culverts.—Paper, 6x9 ins., 24 pp. The Canton Culvert Co., Canton, O.

This is the 1910 edition of a catalog describing culverts made of a rust resisting iron having the trade name of No-Co-Ro metal. The book contains useful data.

The Mason Builder.—Paper, 6x9 ins. Charles Warner Co., New York City.

This is a new monthly publication by a cement company, devoted to the uses of cement and lime. It is well illustrated and the three numbers thus far received are very good.

Fine Steel for Heavy Work.—Paper, 7x10 ins., 83 pp. Penn. Steel Casting & Machine Co., Chester, Pa.

This catalog is a splendid pictorial history of work done by this old and well known company. There is a great deal in the book to interest contractors.

Conduit Construction.—The Safety Insulated Wire & Cable Co., Chicago, Ill.

A small envelope folder advertising a construction company making a specialty of underground electrical installations.

Heavy Wagons.—Paper, 8x8½ ins., 68 pp. Columbia Wagon Co., Columbia, Pa.

This catalog describes a full line of heavy carts and wagons for contractors and other wagon users. Some very good specialties are illustrated.

Generators and Producer Gas Plants.—Paper, 8x11 ins. Hill-Hupfel Engineering Co., New York, N. Y.

This company publishes 8-page illustrated bulletins of a convenient size to file in letter files. Each bulletin describes some special machine and valuable data are given with costs when same may be had.

Cast Iron Pipe.—Cloth, 9x11 ins., 156 pp. United States Cast Iron Pipe & Foundry Co., New York, N. Y.

This book is handsomely illustrated and printed on heavy coated paper. It contains line cuts of standards with tables of sizes and a number of useful tables relating to pressure and flow of water, friction, etc.

Interlocking That Locks.—Paper, 6x9 ins., 25 pp. The Interlocking Tube Co., 79 Dearborn St., Chicago, Ill.

Interlocking tubes are made of steel and are tongue and groove construction of various diameters. They are driven like piles and when filled with concrete make a strong wall. This wall may be reinforced and is excellent for foundations, wharves, piers, etc.

Electrical Instrument Bulletins.—8x10½ ins. Fort Wayne Electric Works, Fort Wayne, Ind.

Bulletin 1118 of 12 pages describes the Type A Transformer, and Bulletin 1119 describes "Northern" Type B, Direct Current Motors. A number of smaller pamphlets sent describe a handy electrical pump and the Atwood Vacuum Cleaner.

Austin Drainage Excavators.—Paper, 7x10 ins. 112 pp. F. C. Austin Drainage Excavator Co., Railway Exchange Building, Chicago, Ill.

This catalogue should be in the hands of every engineer and contractor having anything to do with the excavation of ditches and canals for either irrigation or drainage. It describes a number of styles of a type of excavator that cuts sloping banks at one operation to any depth. A number of useful earthwork tables are given. The catalogue is well written, well printed and voluminously illustrated.

Construction Methods on a Concrete Dam.—Paper. 3½x6 ins. 8pp. Ernst Wiener Co., 50 Church street, New York, N. Y.

In building a concrete dam at Bellows Falls, Vt., industrial cars were used to great advantage as described in this booklet.

Eclipse Machinery.—Frick Company, Waynesboro, Pa. Paper. 7½x9 ins. 60 pp.

Traction engines, portable sawmills, threshers, etc., are illustrated in this book.

Emerson Pumps.—Paper. 6x9 ins. The Emerson Steam Pump Co., Alexandria, Va.

The 1910 catalogue contains 52 pages and is handsomely illustrated. Accompanying it is a 19-page illustrated catalogue of parts for this extremely handy and valuable contractor's pump.

Flexible Metallic Tubing.—Paper. 6x9 ins. 15 pp. Schoen-Jackson Co., Media, Pa.

Describes flexible metallic tubing and connections in all sizes for pressures up to 4,000 pounds from either steel, copper or brass, for steam, water, air, gas, oil and conduits, or for any other purpose for which hose is used.

Standard Specifications for Hard Drawn Copper-Clad Steel Wire.—Paper. 5x8 ins. 8 pp. Duplex Metals Company, Singer Building, New York, N. Y.

The subject matter of this book is sufficiently indicated in the title.

The Sharon Silo.—Paper folder. 5½x7⅛ ins. 8 pp. Sharon Steel Hoop Co., Commercial National Bank Building, Chicago, Ill.

This circular describes a silo having a steel frame of Collins united studding covered with metal lath and plastered, thus forming an air space in the walls.

Steel Fabric.—Paper. 7x10 ins. 22 pp. Clinton Wire Cloth Co., Clinton, Mass.

This is No. 1, Volume 1, of a publication to be published at frequent intervals in the interest of Clinton Wire Lath and Clinton Electrically Welded Wire. This issue contains a description of the work done in covering the unsightly steel work of the Boston Elevated Railway structures with reinforced concrete, Clinton products being used.

Marine Oil and Gasoline Engines.—Paper. 6x9 ins. Fairbanks, Morse & Co., Chicago, Ill.

Catalogue 112-B contains 17 pages and describes four cycle heavy duty marine engines. Catalogue 113 contains 32 pages and describes two cycle marine engines. These catalogues are printed on heavy coated paper and are handsomely illustrated.

Peerless Hauling Engines.—Paper. 6x19 ins. 64 pp. Geiser The Manufacturing Company, Inc., Waynesboro, Pa.

This is a general catalogue of "Peerless" machinery comprising hauling engines for all uses, threshers, saw mills, gasoline engines, plows, wagons, etc.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The largest municipal contract to be let the past week was probably the one awarded by the City of Portland, Ore. This contract called for the construction of Bull Run Conduit No. 2, and was secured by the Shaw-Batcher Co. Pipe Works, Sacramento, Cal., at $1,259,782.—Several fairly large railroad construction contracts were let during the past week, chief of these being the contract for constructing the Evansville-Mt. Carmel line for the Big Four Ry. This contract was secured by the Walsh Construction Co., Davenport, Ia. Among the other railroad contracts were the following: Guilford Co., Kansas City, Mo., for constructing six miles of line from Shawnee, Kan., to Zarah, for the Kansas City, Lawrence & Topeka Electric R. R.; W. O. Robertson, San Antonio, Tex., grading contracts for the first 90 miles of the San Antonio, Rio Grande & Tampico R. R.; and Peter Simms, Tacoma, Wash., for constructing the Point Defiance-Narrows line for the Northern Pacific, a total distance of about 42 miles.—The New York State Highway Commission is now calling for bids for over 200 miles of state highway construction. Bids for the work are to be opened April 4, 6 and 8.—The Kenefick-Quigley-Hoffman Construction Co., of Kansas City, Mo., and Denver, Colo., contractors for the irrigation system for the Colorado Southern Irrigation Co., are to sublet over $2,000,000 worth of the work on April 5, from their offices at Canon City, Colo. —Announcement has been made that the new Western Pacific line from Salt Lake City to San Francisco will be open to passenger traffic by June 1.—The Canadian Pacific Ry. is now calling for bids for completing the canal system in the eastern section of its irrigation branch in Alberta. The contract involves about 25,000,000 cu. yd. of excavation.

The Commission Form of City Government.

The great tidal wave of 1900 which fell upon the city of Galveston, Tex., not only washed out a greater part of the city but it also washed in a new form of city government which seems to have gained a firm foothold in many cities of this country. Following the great flood chaotic conditions prevailed in Galveston, but with characteristic courage the citizens set about rebuilding their city. The City Council was found wanting under the abnormal conditions that prevailed: Inefficiency was seen on every side and charges of graft abounded. Finally the citizens decided that in order to carry out their plans, to make the new Galveston a stronger and better city than the old, it was necessary to have a form of government strong enough to handle the situation. Accordingly a charter was obtained from the legislature and a form of city government new to America came into being. Under this new form of city government the City Council was abolished, and all authority was vested in five commissioners, who were at once the executive, legislative and all other branches of the municipal government. This was the start of the commission form of city government in this country. The Galveston plan proved so successful that it was soon adopted by Houston. Other cities in Texas followed suit and at the present time there are 15 cities in Texas which have the Galveston Commission plan. Other states soon took up the new form of municipal government. The legislature of South Dakota passed a law which, while retaining the essential features of the Galveston plan, was an improvement over it, inasmuch as it put all responsibility upon the people. The State of Iowa also adopted a similar law. At the present time there are about 60 cities having a combined population of something like 3,000,000 people which have adopted the essential features of commission government. Among the cities of over 100,000 population which have adopted this plan are Boston, Buffalo, Memphis, St. Joseph and Tacoma. Nine cities in Kansas are governed under the Des Moines plan, and in Iowa there are also a number of cities similarly governed. In Illinois and Michigan efforts are being made to secure an enabling act from the State legislature. In the former state 20 of the larger cities have formed an organization to secure this act.

Some Reminiscences of an Old Timer.

The Hoosac Tunnel was the first railroad tunnel of any great length to be constructed in this country. The contract for its construction was let in 1868, but, it was not until Feb. 9, 1875, that the first locomotive passed through the tunnel. The party making the first trip consisted of Thomas Doane, State Engineer; M. T. Munson, Superintendent of Construction for the contractor; N. C. Munson, Contractor for the Grenfield & Troy R. R., owned by the State; C. D. Munson, a contractor on the tunnel, two other men, and a number of laborers. Of this party the engine driver and C. D. Munson, as far as known, are the only persons living. Mr. Munson now lives in Florida, where, notwithstanding he is 83 years old, he is engaged in extensive orange and pineapple culture. In a recent interview Mr. Munson told of the completion of the tunnel and the memorable first trip. Speaking of this he said: "There was attached to the locomotive a boxcar in which were 8 or 10 laborers. The day was severely cold. The start was made about noon, and we went safely through to North Adams, remaining there about an hour, then returning to the east end of the tunnel.

"The reconstruction of the state railroad and the construction of the tunnel were in charge of a state commission of three men. It was desired to forward the construction by sinking a central shaft, from which two faces could be worked and debris hoisted out. The Hoosac mountain has two summits, one on the east and one on the west, leaving a valley between. The central shaft was started at the lowest place in the valley between the two summits. It was 1,600 ft. from the surface of the ground to the tunnel grade. Hoisting apparatus and a building of wood were erected. When the central shaft had been sunk about a thousand feet a fire consumed the hoisting apparatus and building, with its contents. There were at the bottom of the shaft 11 men at work. Their bones were taken out several months later, and if any inquest was ever held I never heard of it. The hoisting building was rebuilt of brick and stone. Near the east end of the tunnel can be seen a round hole about 25 ft. across, where someone undertook to bore the tunnel with a machine, but after getting about 15 ft. into the solid rock stopped."

Old Mexican or Spanish Land Measures.

The following notes on old Mexican or Spanish land measures originally appeared in the Galveston News in 1859 in the form of a letter from Col. F. W. Johnson. This letter was recently reprinted in the Houston Post. Col. Johnson, by the way, was one of the earliest surveyors in Texas, and he, with Col. Ben Milam, was in command of the Texans who stormed Bexar (San Antonio) in December, 1835. His original letter to the Galveston News was as follows:

Editors Galveston News:

Industry, Texas, September 3, 1859.—I find in the Texas Almanac of 1857-8 tables showing the difference between English and Mexican long and land measure. The second seems a correction of the first. Although correct as to results, it furnished no rule by which its equivalents are obtained. Believing a brief history of the ten-vara chain used by the Mexican and Texas government will be of interest to many, I send you the following, with the rule by which the equivalents may be obtained: From 1821-2 to 1830 there was no uniform measure in laying out lands. Chains used were from 29 ft. to 28½ and 27 ft. 9⅔ ins. Each surveyor regulated his chain by what he believed the colonization laws required. Hence the difference in old surveys. In 1830 the two-pole chain of 50 links, reduced to 10 varas of 33⅓ ins., making the length 27 ft. 9⅓ ins., was established in Austin's colony, every five links of which equals 1 vara and every link equals 2/10 of a vara. The long and land measure established by the government of Mexico, compared with that of the United States, is found to be less by a discount of 8 per cent. Hence 1 yd. equals 1.08 varas and 100 yds. 108 varas. Hence, also, yards × 1.08 equals 108 yds. and 1.08 yds. × 1.08 equals 100 yds. There is perhaps no land measure less simple than that of Mexico. The vara is the unit; 5,000 varas the side of the league, 1,000 varas the side of a labor. The labor being the least subdivision of the league, may be regarded as the unit in quantity, and is the 1/25 part. An area 25,000,000 square varas equals 1 league or 4428.4 acres. An area of 1,000,000 square varas equals 1 labor or 177.136 acres; 5654.3797 square varas equals 1 acre.

The State Legislature of Rhode Island is now considering the application of the Southern New England Ry. for a charter. This is a Grand Trunk Ry. project and by means of this line the latter would secure an entrance to Providence, R. I. In a statement before the legislature, committee vice president E. H. Fitzburgh of the Grand Trunk said that the road would surely be built if the charter was granted.

The Alaska Petroleum & Coal Co., T. S. Lippy, president, Seattle, Wash., is stated to have had surveys made and to have let the contracts for building a railroad from Controller Bay in Alaska to the coal mines in the Katallas field. The proposed railroad will be 24 miles long, extending from the harbor east of Katalla to Carbon creek, in the coal fields.

According to an estimate furnished by Engineer J. B. Ferguson, the elevation of the Western Maryland R. R. tracks through the city of Hagerstown, Md., will require an expenditure of $200,000.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ALABAMA.

J. M. Kinney and C. W. Merritt, Pensacola, Fla., have the contract for grading 12 miles of line for the Pensacola, Mobile & Tennessee Ry. from Sticks River to Loxley, Ala. The work includes about 30,000 cu. yds. of earth excavation and about 35,000 cu. yds. of embankment.

CONNECTICUT.

Plans are being prepared by the engineering department of the New York, New Haven & Hartford R. R., for double track work on the Berkshire division from Hawleyville, Conn., to Botsford.

IDAHO.

The Central Idaho R. R. Co. has been incorporated and surveys have been made from Owinza to Payette. Nothing further has been done about this matter and construction or any further expenditures, is not yet authorized. This is an Oregon Short Line R. R. project.

ILLINOIS

As stated in our last issue the S. R. H. Robinson & Son Contracting Co., 915 Chemical Bldg., St. Louis, Mo., has the grading contract for constructing the Cairo & Thebes R. R. between Cairo and Thebes, Ill. The contract includes 350,000 cu. yds. of earth excavation, 50,000 cu. yds. of rock excavation and 300 cu. yds. of concrete masonry. The excavation is principally side borrow work the material being sandy loam with very little clearing. The work is principally through cultivated fields and covers 11½ miles of line. With the exception of one heavy mile, it is entirely a scraper proposition. Some of the work has been let to J. M. Wolfe, Thebes, Ill., but the contractors still have about 100,000 cu. yds. of side borrow work which they will sublet.

INDIANA.

The Walsh Construction Co., Davenport, Ia., has been awarded the contract for the construction of the Evansville-Mt. Carmel line for the Cleveland, Cincinnati, Chicago & St. Louis Ry.

IOWA.

The Iowa City, Ottumwa Southwestern R. R., which projects a 75 mile line between Ottumwa and Iowa City, has completed surveys and has about secured the capital for the construction of its line. The line is to pass through Sharon Center, Frytown, Amish, Wellman, Krota and Ollie. Frank Tanner, Iowa City, Ia., is vice president.

LOUISIANA

The Alexandria & Western Ry. has secured the capital for the construction of its projected 50 mile line traversing the Bayou Rapides territory in Louisiana. The company will do its own work. I. W. Sylvester, Alexandria, La., is chief engineer; G. F. Cotton, Alexandria, is president and W. H. Larsen, Alexandria is secretary and treasurer.

MICHIGAN.

Bids will be requested in 10 days on 10 miles of new single track railroad grading near Kalamazoo, Mich. Responsible contractors owning suitable team outfits immediately available for such work may receive invitations to bid by applying to H. P. Robinson, 703 Plymouth Bldg., Chicago, Ill., and giving particulars as to size and kind of output. The work is to be paid for in cash. Official advertisement will be found elsewhere in this issue.

MISSOURI.

The Chicago, Rock Island & Pacific Ry. Co. is doing a large amount of ballasting and rail renewal on its line between St. Louis and Kansas City, Mo. It is not, however, intended to make any changes in the line.

The Kansas City, Lawrence & Topeka Electric R. R. Co. of Kansas City, Mo., has awarded a contract to Guilford Co., Kansas City, Mo., for the construction of 6 miles of line from the present terminus at Shawnee to Zarah.

MONTANA.

The Eastern Montana Electric Ry. Co. has surveys under way for its projected 80 mile line from Red Lodge via Clarks Fork and Bear Creek and the capital for the constructing of the line has been promised. F. A. Kesselkuth, Billings, Mont., is chief engineer, and A. C. Logan, Billings, is president.

NEVADA.

The San Pedro, Los Angeles & Salt Lake R. R., E. G. Tilton, chief engineer, Los Angeles, Cal., has begun temporary repairs on its line in Meadow Valley, Nevada, which was badly injured by recent floods.

OKLAHOMA.

The Enid, Ochiltree & Western R. R., recently chartered in Oklahoma, has had preliminary surveys made for its Oklahoma lines. The capital for construction, however, has not been secured as yet. The total projected length of the lines in Oklahoma is 500 miles and they are to traverse Beaver, Harper, Ellis, Woodward, Dewey, Major Woods, Alfalfa, Grand, Garfield, Kingfisher, Logan, Canadian and Oklahoma counties. This company already has its line in the Texas Panhandle under construction. B. H. Tallmadge, Enid, Okla., is president.

NORTH CAROLINA.

The Isothermal Traction Co. of Rutherfordton, N. C., has surveys under way for its projected 98-mile line from Gastonia via Shelby and Rutherfordton to Asheville, N. C. Negotiations are under way for securing the necessary capital for the construction of the line, and construction contracts will be let in six months. K. S. Finch, Charlotte, N. C., is president.

WEST VIRGINIA.

Johnson & Briggs, 216 Mutual Bldg., Richmond, Va., as previously noted, have five miles of work on Horse Creek in West Virginia. The work is on a branch line of the Chesapeake & Ohio R. R. from Julian. It is light work, not suitable for machinery, and is already covered with the usual cart and scraper force. Work is well under way.

VIRGINIA.

The contract recently awarded to the Joseph H. Sands Contracting Co., Roanoke, Va., for constructing the Petersburg low grade connecting line for the Norfolk & Western Ry. at Petersburg, includes 600,000 cu. yds. of earth excavation, 18,000 cu. yds. of concrete masonry and 64,000 lin. ft. of piling. Wright & Dickey, Petersburg, Va., have been awarded the subcontract for the concrete and piling.

TEXAS

Preliminary surveys have been made and the capital has been partly secured for the construction of the proposed line of the Nueces River Valley R. R. As projected this road is to be 175 miles long, extending from Beeville, Tex., to Eagle Pass, passing through Oakville, Tilden, Cotulla and Carizzo Springs. Construction contracts are to be let between April 1 and May 1, 1910. John Andrewartha is chief engineer, Wm. A. Frisby, Beeville, Tex., is president, and Lee Frisby, Beeville, Tex., is vice president and general manager.

The Texas Building Co., F. & M. Bank Bldg., Fort Worth, Tex., has been awarded the contract for the grade work for the Brownwood North & South R. R., from Brownwood to May, Tex., a distance of 20 miles, as stated in our last issue. The contract includes approximately 200,000 cu. yds. of earth excavation, 5,000 cu. yds. rock excavation, 800 lin. ft. of pile trestle and approximately 7,000 lin. ft. of piling. Probably one-half of the grading will be sublet immediately. The railway of which John Meade, Brownwood is chief engineer, is in the market for bridge and track material.

WASHINGTON.

The Hurley-Mason Co., Tacoma, Wash., and Portland, Ore., as stated in our March 16 issue, has a contract for a considerable amount of masonry work on the line of the Northern Pacific. The work extends from Tenino to Vancouver, Wash., and covers the building of abutments and piers for several river crossings. The work is for the second track of the Northern Pacific, the line of which has been changed in several places. The contract includes 40,000 cu. yds. concrete masonry and 100,000 lin. ft. of piling.

WISCONSIN.

The Prairie Farm & Southwestern Ry., which projects a 25-mile line from Prairie Farm, Wis., is now having surveys made. The company has partly secured the necessary capital for the construction of the line and plans to begin construction work April 15. The company will do its own work. J. H. Thomas, Prairie Farm, Wis., is chief engineer, and G. E. Scott, Prairie Farm, is president.

WYOMING.

MacArthur Brothers Co., Thermopolis, Wyo., or Walton, Wyo., have 450,000 yds. of exceptionally fine machine and fresno work to sublet in Wyoming; Burlington transportation. Official advertisement will be found elsewhere in this issue.

Power Developments, Levees, Drainage and Irrigition Works.

ARKANSAS.

County Judge of Ashley County Arkansas, has contracted with G. A. McWilliams, 702 Royal Insurance Bldg., Chicago, Ill., for the construction of a system of Drainage Ditches in Hamburg Drainage District No. 1 of Ashley County. The amount of contract is $80,000. McWilliams also contracted to take the Bonds of said District, at par, in payment of construction work.

CALIFORNIA.

Plans are being made for the proposed reservoir scheme of the Calaveras Development Co. of Stockton. The dam is to be of concrete with under sluices and spillway. Eventually flumes and ditches for irrigation will be installed. Contracts for construction work will probably be let in 1911. The estimated cost of the project is $600,000. W. G. Hunter, 219 East Flora St., Stockton, Cal., is engineer.

The Rubio Canon Land & Water Association, J. B. Coulston, secretary, Pasadena, Cal.,

will construct a 3,000,000 gallon storage reservoir in Rubio Canon; however, only the excavating for this reservoir will be done this year. It is likely that a contract for the excavating will be let within the next 30 days. The contract for the concrete work will not be let until next year.

COLORADO.

The Kenefick-Quigley-Hoffman Construction Co., Kansas City, Mo., as mentioned in our last issue, has been awarded the contract at $12,987,000 for constructing one of the largest irrigation projects yet undertaken. The contract was let March 8 by the Colorado Southern Irrigation Co. of Canon City, Colo., and A. L. Register & Co. of Philadelphia. The lands to be irrigated lie on both sides of the Arkansas River, beginning at Canon City and extending down to Pueblo, covering 400,000 acres. The contract includes the building of twelve dams, ranging in height from 112 ft. to 200 ft., excavating 160 miles of main canals and several hundred miles of laterals. Fourteen tunnels will be driven, the longest of which is to be one-half mile long and is located near Canon City. Four of the dams will be located in the mountains, three on Grape Creek and one near Salida on the Arkansas River. They will be built of concrete and of the most improved design of construction. The other eight dams will be located below Canon City; they will be built of earth with concrete face and core walls. All construction has been designed by Mr. W. H. Rosecrans of the Arnold Co. of Chicago, under whose supervision as engineer the construction will be done. The Kenefick-Quigley-Hoffman Construction Co., whose present western office is in the Century Bldg., Denver, Colo., will soon establish a local office in Canon City and will commence the actual construction as rapidly as machinery and forces can be shipped in. The work is to be sublet and further information will be found in our proposal advertising columns in this issue.

GEORGIA.

Following bids were received March 9 by Col. Dan C. Kingman, U. S. Engineers, Savannah, Ga., for improving Club and Plantation creeks, Georgia, by dredging 111,000 cu. yds.: Simons-Mayrant Co., Charleston, S. C., 17.3 cts. per cu. yd.; P. Sanford Ross, Inc., Jersey City, N. J., 24½ cts. per cu. yd.; Paschal N. Strong, Savannah, Ga., 15½ cts. per cu. yd.; Savannah Dredging Co., Savannah, Ga., 17.8 cts. per cu. yd. All bids were rejected and it was deemed to be to the advantage of the United States to let the whole work at one time, when the additional funds required for the completion of the project became available, which amount is provided for in the pending river and harbor bill. When the work is readvertised, the amount to be expended will be approximately $40,000. Under the present specifications it was intended to expend only $20,000.

IOWA.

The contract for constructing a ditch in Drainage District No. 10, bids for which were received March 9 by the County Auditor at Sibley, Ia., has been let to the Standard Drainage Co., Windom, Minn., at 10.9 cts. per cu. yd., for the main ditch, and 14 cts. per cu. yd. for the lateral. The main ditch will be 30,045 long, the cut averaging 6.94 ft. and the lateral will be 2,666 ft. long, thus averaging 6.25 ft.

The contract for constructing Drainage District No. 12 in Louisa County, Iowa, has been let to Chapman Bros., Muscatine, Ia., at 7.9 cts. per cu. yd. The work, bids for which were opened March 16, includes the following: Section 1, 111,000 cu. yds. of excavation, 6 acres of clearing; Sec. 2, 154,000 cu. yds. excavation, 3 acres of clearing; 127,000 cu. yds. of excavation, 12 acres of clearing; 87,000 cu. yds. of excavation, 30 acres of clearing.

John McAndrews, Kankakee, Ill., has been awarded the contract for constructing the Ocheyedan River improvement, District No. 6, for Clay County, Ia. The contract price was 5.97 cts. per cu. yds. The ditch is 11.55 miles long with side slopes 1 to 1 and 6-ft. berm. The soil is black dirt and gravel. The work includes the following:

		Width.	
Sec. Y'dage.	Max. Cut.	Av. Cut.	Bottom.	Top.
1... 69,301.1	11.95	5.65	8 ft.	20 ft.
2...227,233.9	11.75	...	...	...
3... 83,058.3	11.20	8.20	25 ft.	41 ft.
4... 74,189.8	11.70	9.20	23 ft.	41 ft.
5...100,985.0	11.40	8.45	22 ft.	39 ft.
6... 55,685.7	12.05	8.50	21 ft.	39 ft.
... .	...	9.55	20 ft.	39 ft.
7... 11,167.2	6.90	8.60	18 ft.	35 ft.

OREGON.

The contract for constructing Bull Run conduit No. 2, for the city of Portland, Ore., has been awarded to the Schaw Batcher Co. Pipe Works, Sacramento, Cal., at $1,259,782. The itemized bids for this work will be found elsewhere in this issue.

MINNESOTA.

Jenniges & Zubroegel, Wanda, Minn., were awarded the contract March 19 for constructing Judicial Ditch No. 1 at Redwood Falls. The contract price was $4,115 and the work is all tile work.

MISSISSIPPI.

Bids are asked by J. D. Laughlin, Chancery Clerk of Warren County, Vicksburg, Miss., until Monday, April 6, for building a canal in Sandy Bottom.

OHIO.

J. A. Roberts, Ashland, O., has been awarded the contract for straightening, widening and deepening the Jerome Fork branch of the Mohican River for Ashland County. The contract price was 9.7 cts. per cu. yd. and the work includes 313,000 cu. yds. of dredge work. Bids were opened March 18.

WYOMING.

Bids are asked until about April 15 for the construction of the Coney Canal near Cokerville, Wyo., the approximate quantities being as follows. Earth excavation, 75,000 cu. yds.; loose and solid rock, 2,000 cu. yds. Information can be obtained from W. Newbrough, M. Am. Soc., C. E., chief engineer, Evanston, Wyo., or from S. M. Covey, 933 E. 1st South street, Salt Lake City, Utah.

CANADA.

Bids are asked by J. S. Dennis, assistant to 2nd vice president Canadian Pacific Ry., Calgary, Alberta, until Monday, April 1, for the labor required to complete the timber construction in the Western Section of the Irrigation Block, Alberta, amounting to upwards of 1,250,000 ft. B. M. of timber. Plans, specifications, and any other information may be obtained at the Office of the Assistant Chief Engineer, Calgary.

Bids are asked by J. S. Dennis, assistant to the second vice president, Canadian Pacific Ry., Calgary, Alberta, until noon, May 1, for all excavation required to complete the canal system in the eastern section of the Canadian Pacific Railway Co.'s irrigation block, Alberta, amounting to upward of 25,000,000 cu. yds. of material. Plans, specifications and all other information may be seen at the office of the assistant chief engineer, Calgary, Alberta. Official advertisement will be found elsewhere in this issue.

A bill is before the U. S. House of Representatives to incorporate the East Washington Suburban Ry. Co., which proposes to construct an electric road from near the intersection of Nichols Av. and Good Hope road, at Washington, D. C.; thence along or near the Good Hope road to the Bowen road, and following the Bowen and Suitland roads to the District line. The incorporators named in the bill are Samuel E. Cox, William A. Harrison and A. W. Thomas of Maryland; Albert Carry, O. A. Emmons, John Kuhn, Maurice Otterback, Robert Bradbury and George E. Emmons of the District of Columbia; Reese Carpenter of New York and R. H. Phillips and J. S. Sims of Virginia.

The Louisiana Investment & Development Co., of which E. J. Larkin, 225 Dauphine St., New Orleans, La., is local representative, is considering a project that contemplates the purchase of the Barataria and Lafourche canal and the establishment on that waterway of a million-dollar barge line, thus connecting New Orleans with Morgan City and the Teche district.

The Honduras Transportation Co., of Detroit, Mich., has been chartered under the laws of the State of West Virginia. The company proposes constructing railroads and providing other means of transportation in Honduras and will operate under Decree No. 62 of the Honduran government granting franchises to Thomas W. Troy. The company has a capital stock of $1,000,000 and the incorporators are Harry E. Simons, Frank A. Gordon, Leopold Freud, John H. Bissell, of Detroit; Lewis H. Kirby, of Kalamazoo.

Surveys have been completed for an extension of the Tennesse & North Carolina R. R. from Mt. Sterling, N. C., to Canton, N. C., and it is said that construction work will be started at once. A. J. McMahon, Newport. Tenn., is superintendent.

J. B. Daniel of Wonder, Nev., has secured from the government a lease on the power site on the Truckee-Carson Irrigation Canal, 16 miles west of Fallon, Nev. There is sufficient water and sufficient drop to generate at least 2,000 hp. and Mr. Daniel expects to build a plant that will cost in the neighborhood of $50,000, and to supply Wonder and Fairview with light and power.

Preliminary surveys have been made for an extension of the Coal & Coke Ry., R. H. Pemboke, chief engineer, Elkins, W. Va., from Roaring Creek Junction to Elkins, a distance of eight miles. It is planned to have construction work completed this year. Later the line will be extended from Elkins to Parsons and Rowlesburg.

The Nebraska Traction & Power Co., W. D. Crist, Omaha, Neb., is planning to begin work this spring on an extension of its interurban line from Ralston to Springfield via Papillion.

Announcement has been made that construction work will soon be commenced on the proposed extension of the Louisiana & Pine Bluff R. R. from Dollar Junction to a point near Champagnolle, Ark., a distance of about 22 miles. The line will pass through several small towns and open up a rich virgin timber section in Union County. W. H. Lee, Huttig, Ark., is chief engineer of the company.

The Trenton Power Co. of Trenton, N. J., has been incorporated with a capital stock of $310,000, the incorporators being D. W. Duncan, H. F. Price and James Fry.

Construction work is to be started in the early spring on the new proposed 20-mile railroad of the Lee Land & Lumber Co. As projected, the line will start at Winn, Me., and pass through Lee and on to No. 3. All right of way has been secured. Amos F. Gerald, Fairfield, Me., will construct the line. A. A. Stebbins, Lee, Me., is president of the company.

The Harrison Southern R. R. Co. has filed articles of incorporation with principal offices at Harrison, Idaho, and capital stock of $100,000, $51,000 of which has been subscribed. The company proposes the construction of a line from Harrison, Idaho, to Bell Creek, along that stream to the Chicago, Milwaukee & Puget Sound R. R. The stockholders are as follows: P. H. Wall, $16,000; M. K. Wall, $16,000; A. A. Crane, $16,000.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Citizens Light & Traction Co., Pine Bluff, Ark., is planning to make extensive improvements to its street car lines in Pine Bluff. Several important extensions are also to be made. F. E. Cherot is General Manager.

Larry Boshears, and W. R. Brown, of Corning have bought out the Cole Dredging Co., a former Jonesboro concern, and the firm will soon inaugurate a new system of drainage west of Corning, as an auxiliary to those already in operation.

John A. Purdue & Co., Pine Bluff, have been awarded the contract for constructing five miles of grade towards Columbia, Miss., for the Fernwood & Gulf R. R. The contract amounts to about $38,000.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Town Council of Coalinga has granted a franchise to C. L. Morrill for an electric railway through the town. The County Supervisors have also granted him a franchise over six miles of county roads. The Morrill proposition is for the building of an electric railroad of 15 miles out of the town of Coalinga north and east to the oil field and as far as the California Limited holdings.

Preliminary surveys have been made and practically all right of way secured for the proposed branch of the Northern Electric Ry., E. R. Lilenthal, President, Sacramento, from Fair Oaks, through the Carmichael Colony. The road will tap a rich fuel belt and will probably later be extended to Orangevale.

An application has been filed with Lieut. Charles T. Leeds, U. S. Engineer, 723 Central Building, Sixth and Main Streets, Los Angeles, for permission to build a pier 1,800 feet long between India and Kinney streets, in front of the Lindsay property at Santa Monica.

Durst Brothers, hop growers of Wheatland, have made a proposition to the Western Pacific Ry. to build a branch line to that city. Durst Brothers offer to give the company a place to build a depot and they will also build a large depot at their own expense. They will also help the company build the line to Wheatland from some point near Plumas Lake, it is reported.

Citizens of Red Bluff have raised $21,000 for stock subscriptions for the Eureka Electric R. R. This company is backed by Eastern capitalists who will build the line if Tehama County citizens will raise $100,000 for subscriptions to the stock.

The Sacramento Electric, Gas and Ry. Co. of Sacramento has been petitioned by by owners of property south of that city to extend a loop line from the Riverside road to connect with 21st street at Bonita avenue, in Highland Park.

The Southern Pacific Co. is said to have expressed a willingness to build a railway between Santa Ana and Tustin, if given the right of way, and operate a system of gasoline motor cars around a loop through Santa Ana, Tustin, McPherson, Villa Park, Anaheim, Westminster, Smeltzer, Huntington Beach and Newport Beach.

The city trustees of Vallejo have granted a permit to the newly organized Vallejo Traction Co. the use of certain streets of Vallejo for its electric line to White Sulphur Springs.

The Edison Electric Co., R. H. Ballard, manager, Los Angeles, is planning the erection of $2,000,000 power plant at Long Beach or some other beach city in the vicinity of Los Angeles.

The San Diego Consolidated Gas & Electric Co., C. E. Groesbech, president, San Diego, is to expend about $1,000,000 for improvements. It is stated that without any delay the system is to be extended to Ocean Beach, Pacific Beach, La Jolla, La Mesa, La Mesa Springs, Chula Vista, Otay, El Cajon Valley and Lakeside. All the electric wires in the business section of San Diego are to be placed underground.

Board of Supervisors of San Francisco, Cal., have voted to grant A. J. Pons a franchise to operate a railroad over Gough street, between Market and McAllister, connecting thereby two branches of the United Railroads.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

It is now announced that the Grand Junction & Grand River Ry. will have its electric railway completed from Grand Junction to Fruita, 14 miles, by June 15. Work on the terminal yards at Grand Junction is to be commenced at once.

The Green Lawn Reservoir Co., of Denver, has been incorporated with a capital stock of $32,000, the incorporators being Frank P. Head, George H. Read and George L. Horton.

Good progress is being made on the dam and reservoir of the Park Center Land & Irrigation Co. on Upper Four Mile Creek, ten miles west of Cripple Creek, and it is expected to have the work completed by June 1. The reservoir will be 1¼ miles long, ½ mile wide, with an average depth of 35 ft., impounding over 4,000 acre feet of water for the irrigation of a large tract of land. The dam will be 75 ft. high, 400 ft. in length.

Permanent surveys are to be started soon on the right of way for the proposed line of the Montrose & Paradox Railroad Co. The road will have a water grade, from Montrose, Colo.

Work on the Union Pacific line between Dent and Fort Collins has been commenced. Two camps have been established and subcontracts let.

The Denver & Rio Grande R. R. is to make several improvements in the yards and traffic facilities at Montrose. A subway will be built under the tracks crossing main streets and addition sidetrack facilities will be added.

The Dennis Gibbons Construction Co., of Denver, has been incorporated with a capital stock of $100,000, the incorporators being Dennis Gibbons, E. T. Gibbons and W. T. Huffman.

It is stated here in Denver that the Rock Island system has officially announced that it will not buy the Denver, Northwestern & Pacific R. R., according to a statement of David H. Moffatt, president of the latter road, other plans for building the line to Salt Lake City are being worked out, but construction work west of Steamboat Springs will not be commenced until funds have been provided for the completion of the entire line.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

W. J. Oliver, of Knoxville, Tenn., has bought the partially completed Savannah, Augusta & Northern Ry., at a master in chancery sale, paying $250,000 for it. Mr. Oliver built the road, which at present is graded to Louisville. It is said that the road will be continued to that place and later on may be extended on from Garfield.

The Southern Ry., W. H. Wells, engineer of construction, Washington, D. C., will at once double track its line from Atlanta Junction to North Rome, a distance of five miles.

Engineers are now at work on a plan to construct a large dam across the Chattahoochee river at the falls opposite Mechanicsville, in Lee County, Alabama, and about 20 miles above Columbus, Ga., for the purpose of generating electricity to operate cotton mills and to furnish Opelika, Ala. city with power and electric lights. The promoters of the project are Columbus, Ga., and Eastern capitalists, among whom is B. H. Hardaway, of Columbus, who has already secured titles and options to property at the point on the river where it is proposed to build the dam. It is proposed to either construct a short railroad line from the river to a point on the Central of Georgia R. R. near Motts Mill, or extend the Chattahoochee Valley R. R. down the river to the site selected.

The Albany, Ashburn & Atlantic Ry. Co., has been organized to construct a railway from Albany, Ga., to the Coast by way of Ashburn. The company will take over the Fitzgerald Ocilla & Broxton Ry., now under construction from the coast to a point near Broxton. A charter for the new company will be applied for at once.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Southern Idaho Reclamation Co., S. G. Yerkes, President, Boise, Idaho, has filed plats in the U. S. Land Office for right of way for the pipe line and reservoir of its irrigation system. The reservoir is designated as the Long Tom and when completed under the new plans will be one of the largest in the state. The right of way for this basin is for 3,133.32 acres and according to the estimates of the promoters it will contain 313,332 acre feet of water and have an average depth of 100 ft. Under the old plats for right of way for this reservoir there was but 119,500 acre feet of water in it so that the new plats indicate the company will double its capacity. The plats for the right of way of the pipe line show that the water for the reservoir will be taken from the south fork of the Boise river and carried many miles, crossing Lime, Deer and other creeks, from which water will also be diverted. From the reservoir a main canal will conduct the water to the Sunnyside tract. It is the intention of the company to start active work enlarging the big reservoir just as soon as the plats are accepted.

The U. S. government has accepted the official surveys of the Brunleau-Twin Falls irrigation project and it is believed that immediate work will be started on the project. The Twin Falls Land & Water Co., of Twin Falls, Idaho, is back of the project, which calls for an extension of the canal of the South Side Twin Falls project a distance of over 85 miles west over the new tract. It will be necessary to raise the Milner dam in order to secure the proper volume of water and divert it into the canal, which will be widened and deepened. A chain of reservoirs about four or five, are to be installed, and these will be used for storage purposes, guaranteeing the project water during the entire irrigation season.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Rock River Traction Co., incorporated about a year ago, has practically completed its surveys, and is considering making Princeton a terminal point instead of Sterling as originally planned. As now proposed the line would extend from Princeton to Rock Island by Way of Wyanet, Sheffield, Mineral, Annawan, Geneseo and other towns. H. W. Cole, Geneseo, is President.

Final construction work on the Rock Island Southerns' interurban line between Maple City and Rock Island has been resumed. The team grading work will be finished shortly and there will only remain a small amount of steam shovel work, the laying of some nine

miles of steel, the installation of the overhead electrical equipment and the ballasting of the road. Work was started at several points. Petersons' men went to work with their team outfits at a point north of Middle Henderson, while Grant Brothers started operations at Main Henderson. Marble & Grier put their men at work on the north approach of the Cedar Creek bridge. Reports from the camps of the several contractors are to the effect that with a continuation of the present weather they will make short work of finishing the job. The frost is well out of the ground save in the cornfields, where there still remains a little of the frozen dirt.

The Interurban Construction Co. of Chicago has been incorporated with a capital stock of $60,000 and proposes to construct interurban lines and electric railways. The incorporators are Irving D. Stevens, Charles A. Spenny and Edward B. Harrang.

Surveys have been started at McLeansboro for the projected line of the Illinois Oil and Coal Belt Ry. from Terre Haute, Ind., to Cairo, Ill. The proposed road is an electric interurban line that will cross every railroad in the state running east and west. As stated in our February 9 issue, the Western Indiana Construction Co., Room 12, 6 Sherman St., Chicago, Ill., has the contract for the engineering and construction work. Allen G. Russell, Chicago, Ill., is Chief Engineer.

The street railway company at Springfield is to expend $65,000 for rebuilding its tracks and double tracking in that city.

The Newkirk-Powers Construction Co., of Joliet, have resumed work on their track elevation contract at Joliet for the Chicago, Rock Island & Pacific Ry.

The receivers of the Illinois Tunnel Co. of Chicago, have been granted authority to borrow $3,500,000 to complete and extend the telephone system in Chicago. Under the ordinance the company must have 20,000 telephones in operation by June, 1911. It has at present 3,500 telephones.

The Drainage Commissioners of Harvel and King Union Drainage District No. 2, have awarded the contract for widening and deepening the ditch to A. J. Klentchy at 15.90 cts. a cu. yard. He is to begin work on the ditch as soon as he can move his dredging machinery from the Horse Creek ditch which he is just finishing. Work will begin on the Bentley farm, near Harvel.

The Commonwealth Edison Co. of Chicago, has plans underway for the construction of a turbine generating electric light and power plant on the North branch of the Chicago River at Chicago, which will cost when completed between $15,000,000 and $20,000,000. The plant will consist of two stations for the generation of power with six turbine engines each. One station will be installed at once with 160,000 hp. capacity. When both have been built they will have a capacity of 350,000 hp. Holabird & Roche, architects, Monadnock Building, Chicago, are the architects, and will also superintend the construction work.

Frank Moody, representing Bradner, Smith & Co. paper makers, Chicago, has been in Rockton, securing options on land for a power development of 5,000 hp.. It is proposed to build a concrete dam about one half a mile long and 18 ft. high, giving a head of 15 to 19 ft., capable of developing about 5,000 hp. for industrial uses. O. M. Glass, Rockton, is interested.

The Stoddard Construction Co., has been incorporated with a capital stock of $10,000 and principal offices at Chicago, Ill., and proposes to engage in general contracting business. Edward B. Stoddard, Thomas J. Peden and Roy C. Merrick are the incorporators.

Grading work on the Rock Island Southern Ry. has been resumed at a point seven miles above Monmouth and also at a point three miles south of that city. It is expected that the grading work would be finished by April 15, when track laying will be started. A portion of the line is already in operation. The grading now being done is under the direction of F. J. Peterson.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Cedar Rapids & Marion City Ry. Co. will expend $45,000 in improvements at its power house in Cedar Rapids, comprising a one-story brick addition 70x15, a 1,500-hp. engine, 500-hp. boiler, modern stokers, condensers, air and circulating pumps, etc.

The Centerville Light & Traction Co. of Centerville has purchased a site, 500x100, for car barns and repair shops and freight yards.

A petition has been submitted to the Muscatine County Commissioners, at Muscatine, for the extension of Drainage District No. 3. The improvement, if ordered, will touch 28 sections of land in Louisa county and 38 sections in Muscatine county. No estimate of the probable cost has been made, but it is believed that it will cost not less than $100,000.

Proposition has been laid before the Commercial Club of Iowa City asking that subscriptions of $100,000 be raised in that city for a proposed interurban line to connect Iowa City and Williamsburg. The proposition is being promoted by George W. Rhine, Des Moines.

The franchise for a gas plant at Ames has been secured by Tenney Bros., of Newton, and they will start work at once on the erection of a plant.

The Sioux City Crystal Lake & Homer Ry. Co., Joseph Foye, president, Sioux City, is planning to electrify its roads this spring. The company at present operates gasoline motor cars between Sioux City and Crystal Lake.

It is rumored in the vicinity of Waterloo, Ia. that the Waterloo, Cedar Falls & Northern R. R. is to change its name to the Cedar Valley Railroad and extend the line to Cedar Rapids to make connections with the Cedar Rapids and Iowa line. L. S. Cass, Waterloo, Ia., is president of the W. C. F. & N. R. R.

Work is to be started as soon as the frost leaves the ground on the ballasting and improving of the Great Northern between Sioux City and Perkins, Ia., a distance of 51 miles. W. D. Scott, St. Paul, Minn., general superintendent, has made an inspection of the line and will report to the officials of the road at Sioux City. The line will be relaid with 88 lb. rails and the road bed will be raised in the low places and small grades will be lowered.

The Hawarden cut-off which will be constructed this year by the Chicago & Northwestern Ry., will, it is said necessitate an expenditure of $1,000,000.

The Waterloo, Cedar Falls & Northern Ry. Co., of Waterloo, has arranged for the flotation of a large bond issue and many miles of interurban extensions will be built. One of these is projected from Denver Junction to Waverly, and it is possible a line will be built to the south with Belle Plaine as the terminus.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Motor Grand Traction Co., of Belleville, has engineers in the field locating its line between Concordia and Belleville. The greater part of the right of way between these two points has been secured, and it is believed that grading work will be started early in April. The company projects an interurban line from Chester, Neb., to Concordia and Wichita, Kan. Gasoline motors and gasoline locomotives are to be used. The company is said to have already placed an order with the Buda Co., Chicago, Ill., for a portion of its equipment.

A special election is to be held at Oswego on April 5 to vote on a proposition to issue bonds in the sum of $5,000 to aid the Oswego, Columbus & Cherryvale Interurban.

The State Railroad Board has granted authority for a merger of the Joplin & Pittsburg, the Girard Coal Belt and the Pittsburg & Kansas City electric lines in Southeastern Kansas. The first named has 72 miles of line and the two latter combined have 28 miles. The merger company will be known as the Joplin & Pittsburg Electric R. R. Co. It will take up all the outstanding obligations of all three companies and issue enough new securities to build a system of 250 miles, which eventually will extend from Joplin to Kansas City.

Sam Steele and Nick Delaney, Larned, have been awarded the contract for constructing a 40 ft. regulation half-mile race track at Larned for the Pawnee County Agricultural Association. The track is to be completed by June 1, and will be built under the direction of engineer Fred Eckert.

The city of Liberal has voted a $25,000 bonus for the Garden City, Gulf & Northern Ry., thus completing the list of subsidies for this road between Liberal and Garden City, a distance of 75 miles. Construction work has been started at a number of places along the line.

The Gulf & Northwestern Ry. Co., with headquarters at Goodland, Kan., and a capital stock of $1,500,000 has been granted the right by the state railroad commission to issue stock and bonds to construct the proposed line from Oklahoma City, Okla., through western Kansas Counties to Northern Colorado. The incorporators of this company are J. B. Dyatt, John A. Keeran, C. C. Evans and J. F. Kimmel, Goodland, Kan., J. W. Tibbles, Dresden; James A. Sprague, Seldon; R. B. Ketchum, Canon City, Colo.

Louisiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from New Orleans, La., state that the Gulf, Delta & Northwestern R. R. Co. has filed a charter in that city. It is to build from Cottonport, in Avoyelles Parish, to a connection with the Colorado Southern Road, and to extend north and south from Cottonport. The incorporators are O. H. Williams, William T. McElroy, E. E. Overstreet, W. B. Tscharner, J. C. Lachlin.

Surveys have been made and practically all right of way secured for the projected line of the Avoyelles, Palmetto & Gulf R. R. An excellent route has been found, practically free from swamps. Elections are now being held to vote financial aid to the route. Hollier & Neff, Opelousas, La., are the engineers.

It is reported here in New Orleans that the Frost-Johnson Co. has purchased the timber holdings of the W. T. Joyce Co. in Catahoula and Winn Parishes, in this state, involving a stumpage of about 1,500,000,000 feet and including the purchase of 80 miles of railroad. The company will cut the timber and probably build more railroad.

The Progressive Union of Hammond has again taken up the matter of a motor line between that place, Natalbany and Genesee. Steps will be immediately taken to secure a right of way for such a line, and an effort made to interest outside capital in the building of the road.

Plans are reported to be under preparation for the construction of a railroad from Kinder, La., to timber land, a distance of 15 miles. The work as proposed will include the construction of a bridge over the Calcasieu River. Frank Shutts, Lake Charles, La., is engineer in charge of the work.

The joint committee of the Lafourche Basin and Atchafalaya Levee Board has awarded the contract for a steel hull for a dredgeboat now lying in the Bayou Lafourche to the Johnson Iron Works of New Orleans, at $15,300.

The United Irrigation & Rice Milling Co., Crowley, La., is reported to have 50,000 yds. of levee work which it wants to let at once.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

George W. Burhans, Portland, Mich., is promoting a project for the construction of an electric road from Portland to Westphalia and Forest Hill in Riley Township.

Five townships, four in Berrien County and one in Cass County, have voted favorably on

the question of giving franchises to the Southern Michigan Ry. Co. to cross highways in the respective townships with an electric railroad.

It is reported in Houghton that the Stone & Webster Engineering Corporation, 147 Milk St., Boston, Mass., owner of the Houghton County Traction Co. and the Houghton County Electric Light Co., is to go ahead at once with its proposed Painesdale-Houghton railway line. It is also reported that the corporation is to take over the Sturgeon River water power proposition which was incorporated some time ago.

The Mullen Coal Co., Amherstburg, Ont., recently incorporated with a capital stock of $100,000, has awarded a contract to the Campbell Dock Co. of Detroit, for the construction of a 550-ft. dock.

The State Railroad Commission has authorized the proposed issue of $800,000 in bonds by the Lansing & Northeastern Construction Co., of Lansing, with which to build the electric line from Lansing. It has been announced that the builders expect to have the line in operation by next October. The company has already expended over $100,000 in work on the line and has the grading well under way. Arrangements have been perfected for financing the proposition, it is stated, and the construction will be pushed from now on. The company acquires the Owosso city railway and will rebuild that line as well as install new rolling stock there. The interurban roads runs on private right of way most of the distance between Lansing and Owosso, and a third rail will be used.

L. O. Peppard & Co., Minneapolis, Minn., have been awarded the contract to rebuild the dock recently damaged by fire at Escanaba.

The Southern Michigan R. R. Co. has been granted permission to construct the projected railroad through Niles from Dowagiac, Mich., to Buchanan.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work is to be started this spring on the Great Northern cutoff from Swan River Junction to Milaca, 75 miles. This line when completed will give a direct line from Minneapolis to the iron range. The sections and mileage will be: Minneapolis to Milaca, already built, 64 miles; Milaca to Swan River, to be constructed, approximately 75 miles; Swan River to Hibbing, already built, 30 miles. A. H. Hogeland, St. Paul, Minn., is Chief Engineer.

The Minneapolis, St. Paul & Sault Ste. Marie Ry. is to lay additional tracks near Shoreham, at Minneapolis, and build a 4-story concrete building and an addition to its roundhouse.

The Minneapolis & St. Louis Ry., W. D. Taylor, Chief Engineer, Chicago, Ill., has purchased land at Hopkins, and will, it is said, establish new freight terminals there. According to the report the shops now at Kenwood will not be moved, but the yards now lying between the hills and the shore of Cedar Lake will be discontinued as freight terminals and trains will be made up in the new terminal yards to be established at Hopkins.

A. E. Bennett has shipped his dredging outfit from Randolph, Wis, to Badger, Minn., where he has secured a big contract to dredge about 46 miles of marsh land for the state. The contract amounts to about $65,000.

According to an announcement by M. D. Stoner, city engineer of Bemidji, Minn., work will be completed by June 1, on the railroad from Nakoda Junction to the Black River County of which he is in charge. As projected, the line will connect with the M. & I. Ry. at Nakoda Junction about 7 miles south of International Falls and extend westward to the Black River.

The Canadian Northern R. R. Co. has filed notice that the franchise offered for the construction of its line into Duluth, Minn., will be accepted. Under the provisions of the franchise the line must be constructed from Virginia to Duluth within three years.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys have been finished for the interurban line to Savannah, projected by the St. Joseph Street Ry. Co. of St. Joseph, and the route has been inspected by C. M. Clark, chairman of the executive committee, and G. L. Estabrook, secretary of N. W. Clark & Co., of Philadelphia, owner of the St. Joseph Street Ry. Co., and J. H. Van Brunt, general manager. It is understood that all of the right of way has not been secured as yet.

The Kansas City-St. Louis Electric R. R. Co., D. C. Nevins, President, Kansas City, is said to have made arrangements in London for the disposal of $15,000,000 in 30-year 5 per cent mortgage bonds of the road. The construction work will be begun in about 60 days, as soon as the second survey is completed. The work probably will be started in Howard County, where the company has 10,000 acres of coal land and it is believed cars will be in operation there in the fall.

The Busch-Everett-Walkers syndicate of St. Louis has surveyors in the field running lines for a pipe line to convey natural gas from the Caddo, La., field to St. Louis.

The Chicago, Burlington & Quincy, R. R. is said to be having preliminary surveys made between Mexico, Mo., and Kansas City. Two other surveys were made about three years ago. It has been unofficially understood for some time that the Burlington expected to extend the cutoff from Old Monroe to Mexico city on to Kansas City.

According to reports in Rich Hill, Mo., the Missouri Pacific Ry. Co. has under consideration, the construction of a cutoff from that city to Bagnell, Sedalia or Jefferson City.

As noted several times in these columns, the Missouri Pacific and the St. Louis, Iron Mountain & Southern are planning extensive improvement work for this year. The improvements will involve the expenditure of $15,000,000 and will have largely to do with reconstruction operations between St. Louis and Pueblo and between St. Louis and Texarkana. One of the most important of the new plans is the construction of a four-track line in Illinois from St. Louis to Thebes, 15 miles. Large gravity yards, located opposite South St. Louis, are being enlarged steadily in advance of the double-tracking, and, when completed will be adequate for handling the traffic.

St. Louis Items.

BY A. E. KOENIG.

Pat Walsh, President of the Walsh Construction Co., was tendered a banquet by the business men and his associates in Davenport, Ia. on St. Patrick's Day, his fifty-fifth birthday. From the looks of the menu card we are sure they did not overlook anything, even a Blarney stone. Many happy returns of the day, Walsh.

East St. Louis soon is to have one of the finest boulevards in the United States. It will be practically fourteen miles long and at least half of it will be ninety-six feet wide. It will extend in almost a straight line from the junction of Tenth and State streets and Illinois avenue in East St. Louis, to the public square in Belleville. Aside from being of immense commercial advantage to East St. Louis and Belleville, it is believed that it also will do more than any other one thing toward bringing about the long-talked-of consolidation of all the cities adjacent to East St. Louis. The cities of Belleville, Granite City, Madison, Venice, National City and Brooklyn, are within a few miles, Bellevue fourteen miles away, being farther than any of the others. Although it was believed that Belleville would be the last of these cities to agree to consolidate and to surrender its individuality, East St. Louisians believe that this new boulevard will be the means of showing Belleville why it should join the proposed combination. The plans for the new thoroughfare are being worked out as rapidly as possible by City Engineer Wm. J. Cocken of East St. Louis, his chief assistant, Wilford A. Thompson, and practically their entire office force. These plans should be ready for the Board of Local Improvements within a week. These plans provide for the widening of State street for more than half its length from 66 to 96 feet. From Thirty-eighth to Ninetieth streets, which is a distance of nearly four miles, the boulevard will be paved with brick. On each side of the thoroughfare will be 12 ft. sidewalks. There will be two driveways, one on each side of the street car tracks. Each of these driveways will be 24 ft. wide. The entire cost of the boulevard will be approximately $250,000, and the street car company will be asked to pay at least $50,000.

The Walsh Construction Co., of Davenport, Ia., was awarded the contract for the Big Four Railroad extension in Southern Illinois. They also secured the contract for raising the grade of the Missouri Pacific yards in the east bottoms and the Kaw River bridge at Kansas City, Mo.

Mulvill Bros., Alton, Ill., have a lot of nice team work on the Chicago & Alton R. R. to let.

Gifford & Hogan of the Walsh Construction Co., were in town the other day. Too busy to stay long.

The McIntire-Tese Construction Co. are getting along nicely with their sewer and street work in Wichita, Kansas.

Will Dankleff is working at Edwardsville, Ill., at the present time. Will finish shortly.

A deed of trust amounting to $1,500,000 was filed in Audrain County, Mo., to secure the bonds for the construction of the entire line of the Mexico, Santa Fe & Perry Traction Co. It calls for bonds similar to those already signed for by the subscribers to the lines and states $60,000 may be certified by the trustees as soon as recorded in all counties the road passes through for the construction of the first four miles of the road. After these four miles are constructed the trustees can certify $15,000 and more a mile if called on with proof of additional mile being constructed. The bonds are for the 100 miles of road to run from Mexico to Hannibal and from Mexico to Columbia and Fulton. The deed of trust will be filed in every county through which the line runs. The first mile of the line is almost completed.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers are in the field between Billings Mont., and Bear Creek working on the survey of the proposed Eastern Montana Electric Ry. Co. It is expected that surveys will be completed and a report ready for the directors by May 1. The line may be extended to Red Lodge.

The Northern Pacific Ry. has purchased land at Missoula and will almost double the capacity of its yards at that city. The line between Missoula and DeSmet will also be double tracked this summer.

Preliminary reports on the Butte & Boise R. R. have been made by R. H. Tingley, C. E., of New York, and representatives of French capitalists are now in Montana looking over the project. As projected this road will be 400 miles long, and the cost of construction is estimated at about $20,000,000. The project is being promoted by S. H. Bracey, of New York and Chicago. T. F. Halveston, Boise, Ida., is also interested.

Mass meetings have been held at Wisdom to consider the proposition of A. L. Wright and R. H. Jones, for building a railroad to traverse the southern section of the Big Hole River and to extend to Anaconda and Butte. Ranch owners and business men of the section have practically agreed to give $200,000 for the project, and a free right of way. Surveys are now being made by Thomas M. Ward.

The Chicago, Milwaukee & Puget Sound Ry. has engineers in the field working east from Lewiston through the Forest Grove and Grass Range County. Surveys are also underway in the vicinity of Kendall, two parties have gone to Melston to work north and west to meet the Lewiston party.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Residents of Lincoln Park and vicinity in Rochester are asking that the present West Av. line be extended through the park. At present the line terminates at Lincoln Av., which is the boundary between the city and Lincoln Park, which is situated immediately to the west.

The Internationlal Waterways Commission, with offices at Albany, will shortly take action on the applications of the St. Lawrance Power Co., Ltd., a Canadian corporation, and the Long Sault Development Co., a New York corporation. The proposition of the companies is to dam part of the Long Sault Rapids in the St. Lawrence River and develop 800,000 HP. It is understood that the action will be favorable. The American section of the International Waterways Commission has in its possession amendments to a bill which is now before the United States Congress at Washington, granting rights to the American company to erect its dam, and copies of the amendments have gone to the River and Harbor Committee at Washington, which body will make them public soon. The action of the Canadian section of the International Waterways Commission will probably come after the action of the American section is made definitely public.

The Westchester Northern R. R. Co., recently incorporated, has applied to the State Public Service Commission for authority to construct and operate a steam railroad, connecting the New York, Westchester & Boston Ry. and the New York, New Haven & Hartford road in Westchester and Putnam counties. The company also proposes to construct an extension across the state boundary into Danbury, Conn. The company has a capital of $1,000,000. The estimated cost of the proposed road is $6,766,769, and it is to be a part of the New York, Westchester & Boston company's system, and the stocks and bonds are to be taken up by the New York, New Haven & Hartford Ry. at par.

The city of Batavia has voted to expend $8,000 for a new dam.

The New York Central & Hudson River R. R. has had surveys made and will have work started in the early summer on a spur from Watertown to Sanfords. It will be used for freight purposes, doing away with the long Factory street grade in Watertown.

The Manhattan Bridge Three-Cent Car Line Co. which now has an application before the State Public Service Commission for permission to construct its proposed line in New York City, will use the regulation overhead trolley wire with electric motor power for its Brooklyn service, with underground wires in Manhattan. The total cost of equipping the road will be about $617,000. according to John C. Breckenridge, 95 Liberty street, New York, chief engineer of the company.

The Cliff Electrical Distributing Co., John Harper, engineer, Niagara Falls, has applied to the State Public Service Commission for permission to issue $400,000 additional mortgage secured coupon bonds. This bond issue would be for additions to the generating plant amounting to approximately $96,000; additions to the distributing lines amounting to approximately $126,000; and other improvements involving an expenditure of about $147,000.

North Dakota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Valley City, N. Dak., has granted a franchise to the Valley City St. & Interurban Ry. Co., to lay track and run cars on Fourth, Fifth, Sixth, Seventh and Eighth Avs., and also to cross the N. P. tracks and run over into Normal Park addition.

The Chicago, Milwaukee & St. Paul Ry. Co. is said to have secured a right-of-way through North Dakota as far as Neche.

The Wahpeton-Breckenridge Street Ry. Co., F. L. Strum, Manager, Wahpeton, N. Dak., is reported to have placed orders for materials and supplies and it is said that construction work will be started at once. The eastern terminal of the company's line has been purchased in Breckinridge near the First National Bank building, and the erection of car barns will be started shortly.

The Commercial Club of Fargo, J. E. Weiser, president, is taking steps to secure the construction of a line of railroad to connect Fargo with Chaffee. The line would be about 32 miles long and, if some of the present roads will not build it, it will be built by Chaffee parties. James G. Brown, Chaffee, is interested.

According to reports from Ray, N. Dak., the surveyors of the Minneapolis St. Paul & Saulte Ste. Marie Ry. are working from Plaza, west toward Williston passing through a rich farming country.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The street railway lines at Lima are to be extended in a loop for more than two miles, encircling the new industrial section of the city to the southward.

The Baltimore & Ohio Southwestern R. R., has plans under way for extensive improvements between Cincinnati and St. Louis, which will be made this summer. The work will include some double tracking and the installing of block signals and will involve the expenditure of several hundred thousand dollars.

An election will probably be held in Hamilton on April 16 to vote on an appropriation of $400,000 bonds to construct a levee and other improvements, including parks.

The city council of Cleveland has appropriated $199,000 for the dredging of the Cuyahoga River and bids will be received at once by A. B. Lea, director of Pueblo Service.

Construction work is to be started this spring on the projected line of the Fostoria, Napoleon & Defiance Ry. Co. The road is to extend from Fostoria to Defiance and is to be operated with gasoline motor cars. Charles A. Bliss, Toledo, O., is president and Rufus T. Betts, Toledo, is secretary.

Contractors for work for the Lake Shore, Pennsylvania and other companies for improvements on the new lake front harbor at Ashtabula have resumed the work which has been suspended all winter because of severe weather.

The Wellman-Seaver-Morgan Co., Cleveland, is making good progress on construction of the new battery of Huletts and accessories at Ashtabula and the machines, power house and bridge are well under way. The plant is to be a duplicate of the one erected last year on the Lake Shore side, with 15-ton grabs for ore. It will be in commission late in the coming navigation season.

Plans have been prepared at the office of U. S. Engineer, E. W. Moeser, Zanesville, for the construction of a new levee on Linden avenue, in that city.

The executive committee of the Hocking Valley Ry. has authorized M. S. Connors, Columbus, O., general superintendent of the company, to install 8 additional passing tracks on the line between Columbus, O., and Toledo and to make other necessary improvements.

According to information received from Youngstown, O., work will be started shortly on the proposed line of the Lake Erie & Eastern R. R. Co.

Grading is already under way for the construction of two additional tracks for the Erie & Ashtabula R. R. from Lawrence, Junction to Wampum, O., a distance of 8 miles. The work will require the entire rearrangement of the interlocking system.

The Baltimore & Ohio Southwestern R. R. has begun the construction of a new double track between Loveland and Blanchester, O. E. Stimson Cincinnati, O., is engineer Maintenance of way.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Citizens' Street Railway Co., of Wilburton, has been chartered and proposes to build an interurban line connecting Wilburton, Patterson and Lutie, a distance of ten miles. The capital stock is $100,000, and the directors are James McConnell, Richard Howard, Benjamin Mills, Elias M. Cooper and William H. Powers, all of Wilburton.

Ground was broken at Lawton on March 7 for the construction of the Lawton & Fort Sill Electric Ry. It is planned to have the line completed between Fort Sill and Lawton by May 1.

The Muskogee Traction Co., of Muskogee, has applied to the City Council of that city for franchises for a number of extensions.

The city of Sulphur has raised a bonus of $70,000 to be given to the first interurban to build to this resort. The holders of the trust bonds are negotiating with several sets of capitalists, each set promoting a different road. One proposes to build from Oklahoma City, one from Shawnee, one from McAlister and one from Denison.

Plans are under way for the construction of an interurban line to connect Dewey and Bartlesville. As proposed the line will connect with a projected interurban from Coffeyville, Kan., to Nowata. Alfred Etchen, South Coffeyville, Okla., is interested.

Track laying on the Alton, Wichita Falls & Hollis Ry. has been started and the work will be pushed to Hollis as rapidly as possible. The offices and shops of the railway are to be at Altus.

J. W. Maxcy Co., Engineers, Houston, Tex., have engineers in the field between Ardmore and Chickasha making surveys for a railway from Sherman, Tex., by way of Ardmore to Chickasha.

The contract is said to have been let for constructing the interurban road from Ardmore to Chickasha. According to the plans, the line is to be built from Ardmore to Milo and from Milo the road will be extended to Chickasha and also to Lawton which will give this city connection by interurban with both Lawton and Chickasha. Construction work is to be started early in April. Oscar O. Ayers, Olathe, Kan., is president.

Conference of city officials of Oklahoma City and various railroads interested, was held on March 12, regarding the proposed Union Depot plan for that city.

Plans have been designed by City Engineer Burke of Oklahoma City, which will eliminate all grade crossing and bring the freight all into one general yard and the passenger trains into the union station which is to be located near enough to the business section of the city to make it thoroughly practical from every standpoint. Should the plans carry, it will necessitate the expenditure of approximately $3,000,000 by the various roads.

The Oklahoma Electric Power Co. of Oklahoma City, has been incorporated with a capital stock of $250,000, the incorporators being E. J. Deupree, W. T. Croslen, E. S. Sullivan, R. R. Bell, Charles B. Caldwell and R. B. Howeth, Oklahoma City.

Plans are now under way for the consolidation of the Kansas Northwestern Ry., now under construction, and the railroad controlled by B. C. Mason, Kansas City, Mo., which is being constructed from Elk City, Okla., to Aransas Pass, a distance of 650 miles. The combination of these lines will give a through route from Great Bend, Kan., to the Gulf of Mexico.

Citizens of Walter, Okla, have organized a stock company to finance a proposition to construct a railroad line from that city to Oklahoma City. Thus with the connection of the Wichita Falls & Northeastern line under construction to Walter a through route from Wichita Falls to Oklahoma City will be obtained.

Oscar Parish, a railroad contractor of Madill, Okla., is said to have a contract for grading 10 miles of Rock Island extension from Ardmore to Waurika.

S. Axtell, the engineer of Quanah, Tex., who made surveys for the proposed railroad from Eldorado to Hollis, Okla., has taken up the matter with the capitalists who project the construction of the line from Woodward, Okla, to Quanah, Tex., a distance of 115 miles.

A. C. Robertson, chief engineer of the Mountain, Valley & Plains R. R., has opened

offices in the Beadles Bldg., Oklahoma Ave. and 2nd St., Guthrie, and all work at that end of the line will be directed from Guthrie. Construction work at the western terminus of the line is being directed from Cimarron, N. Mex.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boise-Western Ry. Co. has completed the securing of its right of way through the Malheur Canyon. As projected this road is to extend from Boise, Idaho, to Vale.

The Oregon Railroad & Navigation Co. has notified the State Railroad Commission of its intention to begin the building of the Stanfield-Coyotte cutoff.

The Oregon Trunk Line, F. Stevens, president, Portland, will, it is said, at once let contracts for the construction of that portion of its line from Madras to Bend, a distance of 40 miles.

On account of flood troubles, the officials of the Oregon Railway & Navigation Co. deem it best to construct three miles of the main line on the Washington Division in Hay Canyon along the Snake River. The new route will be located on rock foundation. It is planned to eliminate 1,000 ft, bridge and 160 degrees of curvatures. The work is estimated to cost $100,000. G. W. Boschke, Portland, Ore., is chief engineer of the company.

All grading has been completed for the new 24-mile line from Vale to Brogan, Ore. and ties are on the ground for laying the steel.

E. W. Thomas has applied to the City Council of The Dalles for a franchise to build a street car line in that city.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The following bids were received March 9 by the Department of Docks of Philadelphia, for the construction of the new bulkheads at South St. Pier, preparatory to the erection of a ferry house by the Gloucester Ferry Co. Latta & Terry Construction Co., for $8,441; Filbert Paving & Construction Co., $9,300; B. F. Sweeton & Son, $9,807.53, and the American Paving Co., $9,925. The new ferry house will cost the ferry company $40,000. The bulkhead will extend 140 ft.

Construction work is to be started shortly on the proposed electric railway from New Castle to Sharon by way of New Wilmington. In Sharon alone, over $130,000 has been subscribed for the road. The project is being financed by J. G. White & Co., New York. Among those interested in the line are: George Dresch of Sharon; State Senator James M. Campbell, of Mercer; Frank P. Filer and Lyle W. Orr, Mercer; S. D. Downs, Greenville, and J. H. Veazy, registrar of Westminster College and Dr. Robert M. Russen, president of Westminster college of New Wilmington.

The Pittsburg & Susquehanna R. R. Co. of Pennsylvania has been chartered with a capital stock of $100,000 and will construct a line from Eutahville, Clearfield County to Dean, Cambria County, a distance of 10 miles. The incorporators are Thomas F. Barrett, Philadelphia, President, 992 shares; R. K. Klack, F. J. Salade, J. H. Smeltzer, A. E. Doremus, C. D. Bruce, H. G. Vancourt, all of Philadelphia, Pa., each holding one share.

Surveys have been completed for the projected electric railway of the Altoona & Bedford County R. R. Co. As projected, the road is to extend from Altoona to Bedford City, a distance of 45 miles. It is said that arrangements have been perfected so that construction contracts may be let this month. Charles G. Tate, Altoona, Pa., is chief engineer.

South Carolina Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Greenville, Spartanburg & Anderson Ry. Co. has been chartered with an initial capital stock of $300,000 and an ultimate capital stock of $2,000,000, and purposes to extend the Anderson-Belton electric line to Greenville, S. C., and Spartanburg, S. C. This is the project backed by the Duke interests, J. B. Duke, B. N. Duke and George W. Watts of New York having subscribed for $180,000 of the capital stock. W. J. Thackston, Greenville, S. C., is President and T. F. Mills, Anderson, S. C., is Secretary.

The Orangeburg Ry. Co., of Orangeburg, S. C., with a nominal capital stock of $50,000 and a maximum of $500,000, has been chartered and proposes to build an electric railway from Orangeburg to Springfield, a distance of 30 miles. The incorporators are W. C. Wolfe, J. A. Berry and Lawrence Manning. It is proposed at some future date to extend the line to Columbia, Charleston and Augusta. The road at present will be built entirely within the county of Orangeburg, and will pass through the townships of Livingston, Elizabeth City, Rock Grove, Goodland, Liberty, Hebron, Zion, and Williams. The Edisto Power Co., with a capital of $10,000, was also chartered, the incorporators being the same as for the Orangeburg railway. This company is given the right to develop waterpowers and manufacture light and electrical power.

Tennessee Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Memphis, Pensacola & Northwestern R. R. Co., recently incorporated, is said to have secured the necessary capital for construction, with the intention of beginning work at once. The road is to extend from Memphis to Pensacola, Fla., the route being from a point near Plum Point, De Soto County, on the boundary line between Mississippi and Tennessee in a southeasterly direction, through Meridian to a point on the boundary line between Mississippi and Alabama, leaving the state at or near Pine Ridge, Clarke County, and running in the general direction of Pensacola, Fla. The incorporators are: J. M. Dockery, George E. Newhardt, H. T. Bruce, Dr. B. G. Henning, A. Goodman, S. W. Jones, J. H. Scaife and D. S. Rice of Memphis, Tenn.; Will Dockery of Dockery, Miss.; R. Craig of Chicago and M. J. Roach of Memphis.

The Tennessee Traction Co., according to General Manager Bushnell, Memphis, will be engaged for the next two months in completing surveys for its projected line between Memphis and Jackson. As soon as the route is definitely decided on it is said that grading contracts will be let. Gasoline motor cars are to be used at first.

The Louisville & Nashville R. R. has bought the Jellico R. R. extending from Athens to Jellico Plains, 24 miles in length and it is believed that the road will be extended to Harriman.

Grading is stated to have been started on the first ten miles of the extension of the Chicago, Memphis & Gulf R. R. from Tiptonville, Tenn., to Hickman, Ky.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Eastern Texas Traction Co. of Greenville, has been chartered with a capital stock of $12,000, the incorporators being J. H. Blocker, J. B. Murphy, H. E. Vaughan, W. M. McBride, H. C. Tittsworth, Glen A. Coulson, J. Riley Green, S. B. Perkins, J. H. Myrick, R. N. White, L. N. Byrd and Joseph F. Nichols. The company proposes to build an interurban line projected from Greenville to Wolfe City, in Hunt county, and provides for further extensions to Bonham, Denison, Honey Grove, Paris, Cooper, Clarksville, Dallas, Plano, Chisholm, Rockwall County, and Forney, Kaufman County. Those interested in the road all live in Hunt County.

Location surveys are under way for the proposed Fort Worth-Mineral Wells Interurban line and it is thought that actual construction work will be started in May. Paul Hurley, Fort Worth, is Secretary and Treasurer.

Good progress has been made with grading work on the Bryan-College trolley line and it is over two-thirds completed. A great many ties have arrived and are being distributed along the track. The first shipment of rails has also arrived. The order has been placed for the motor cars and they will be at Bryan by April 20.

The Colorado River Power Co. of Marble Falls has filed its charter at Austin. The company has a capital stock of $1,000,000 and is to construct a reinforced concrete sluice dam with chambers in the interior across the Colorado River at Marble Falls. This dam, which is about 75 per cent completed, will be 750 ft. long and 50 ft. high, with an 80-ft. base and a 16-ft. crown. A railroad and driveway will be laid on the crest and the water will flow through openings instead of over the top. A lake ten miles long will be formed, submerging the falls in the Colorado River above the site of the dam, and a reservoir for the storage of surplus water will be established six miles above Marble Falls. Light will be furnished by the city of Marble Falls and power will be furnished by a saw mill and a cotton mill, the machinery for which is being installed. It is proposed to lay copper cables to Austin and San Antonio to convey electric power to those cities. E. C. Alexander, Marble Falls, and C. H. Alexander and J. O. Wiley, Dallas, are interested.

The Quanah, Acme & Pacific Ry., C. E. Ensminger, General Manager, Quanah, has advised the State Railroad Commission that financial arrangements have been made for the extension of that line southwest from Paducah to El Paso, a distance of about 375 miles. It is stated that the money for building the line is being furnished by one of the large trust companies of St. Louis. The road is already in operation from Quanah to Paducah, about 50 miles, and application will be made to the Railroad Commission for authority to issue bonds to the amount of $30,000 per mile upon the completed track. The route from Paducah to the Texas-New Mexico line has been surveyed. It runs through a part of Western Texas that is settling up rapidly with farmers. It connects with the Frisco and the Fort Worth and Denver City at Quanah. About 175 miles of the road yet to be built will be in Texas and the remaining 200 miles will be in New Mexico.

The St. Louis, Brownsville & Mexico R. R., E. C. Burgess, Engineer of Construction, Kingsville, Tex., is to extend what is now known as the Buckeye switch to Collegeport, a distance of seven miles from the present terminus at the Simpson warehouse on the Texas rice plantation.

The Gulf Texas & Western Ry., Ben B. Cain, Manager, Dallas, Tex., has made preliminary surveys on a short spur from Jermyn toward the Stewart coal mine, 4½ miles distant.

The Bowers Southern Dredging Co., of Galveston has filed an amendment to its charter, increasing its capital stock from $600,000 to $750,000.

Capitalists of Hereford are forming a company to build a railroad from that city to a connection with the Rock Island in Oldham County. It is proposed to raise $150,000 locally.

A bonus of $75,000 has been raised at Gainesville for the construction of a railroad from there to Decatur and on to Bridgeport. The road is to be built by Gainesville capital, twelve local citizens contracting to build the road, which will cost about $500,000, if the bonus above stated is given them. The promoters guarantee to begin work in 60 days and have cars running as far as the county line, a distance of 18 miles, in 18 months, when the bonus shall be paid. M. P. Kelley, Gainesville, is interested.

The North American Dredging Co., of Texas, has been chartered with a capital stock of $600,000, and headquarters at Galveston, the incorporators being Elliott M. Maple, Charles Guthridge of Los Angeles, Cal., Morgan A. Adams of San Francisco, R. A. Percy of Oakland, Cal., and C. A. Houkins of Galveston.

Grading work was started at Temple on March 17 on the construction of the Temple Northwestern Ry.; the contract for which has been let to D. J. Grigsby, Dallas, as stated in our last issue. At a meeting of the stockholders of the railway at Temple on March 14

the following officers were elected W. J. McDaniel, Dallas, president and general manager; H. W. Peck, of Dallas, first vice president and general attorney; J. B. Grigsby, of Dallas, second vice president; P. L. Downs, of Temple, treasurer. In addition to the above, the directors are S. P. Sadler of Gatesville, W. B. Ferguson of Waxahachie and J. V. Bird of Dallas. The above named, together with A. F. Bentley, John Cole, George E. Wilcox of Temple and D. J. Grigsby of Dallas are the incorporators. The company is incorporated for $100,000 to build a line of 100 miles in length from Temple to a western terminus at Comanche.

The Little River Improvement District has issued $18,500 of bonds for building a levee along the Little River to reclaim about 4,000 acres of land. D. A. Morrison, Cameron, is interested.

The City Council of Houston has granted the Houston Electric Co. the right to rebuild some of its lines in this city with T rails.

The Aransas Terminal R. R. Co., of Aransas Pass, has been organized with a capital stock of $7,000 and proposes to build a 7-mile line from Aransas Pass at a connection with the San Antonio & Aransas Pass Ry. Co., southeast across Red Fish Bay to a point near Steadman Island and Hog Island, thence southeast across Harbor Island to Deep Water east of Harbor Island at a point about 1,000 ft. southeast, or at right angles to the line of the north jetty extended. The incorporators are E. O. Burton, A. H. Danforth, A. J. Bell, A. I. Matlock, San Antonio; J. J. Welder, Victoria; J. F. Green, Gregory; D. M. Picton, Rockport; R. P. Clark, Galveston; F. L. Alvord, T. P. Boyd, Fort Worth.

Karner Brothers have begun work on their grading contract for the Texas Central branch road from DeLeon to Cross Plains.

Two complete surveys have been made for the proposed Terrell-Dallas Interurban R. R. By one of these, the road will be 30.1 miles long and by the other, it will be 31.6 miles. The citizens of Terrell are to raise $50,000 and $50,000 is to be raised in Dallas. Over 23 miles of right of way has already been secured. William Cook, Dallas, Tex., is chief engineer.

W. O. Robertson, San Antonio, has been awarded the grading contracts for the first 90 miles of the San Antonio, Rio Grande & Tampico R. R. According to a statement of B. S. Harrison of New York of the Harrison Engineering Co., a director of the San Antonio, Rio Grande and Tampico railroad, the railway will be built directly to the Rio Grande. When the contract just let nears completion, the remainder of the road will be located and constructed. Surveyors are now in the field and several lines are being projected.

Citizens of the city of Wellington, Tex. have offered a bonus of $40,000 to the Wichita Falls & Northwestern R. R., in order to obtain the extension of the line from Altus to Wellington. A charter has already been filed at Austin, Tex., for the extension.

Officials of the Hearne & Brazos Valley R. R. are considering the construction of an extension into the Levy District of Bryan, Tex. J. W. Green, Hearne, Tex., is vice president and general manager of the company.

According to advices from Georgetown, Tex., engineers have completed preliminary surveys for the construction of the proposed Waco-Belton & Georgetown R. R. An executive committee will meet at Waco to consider ways and means for the promotion of the project.

It is stated that L. E. Walker, Quanah, Tex., president of the Quanah & Gulf Ry., has announced that all bonuses necessary for the construction of the proposed line had been obtained and that surveys for the projected route would be made at once.

Citizens of Canadian, Tex., are in receipt of reports stating that the Atchison, Topeka & Santa Fe is considering the construction of a line from Englewood, Kan., to that city.

The officials of the Fort Worth & Denver R. R. and Wichita Falls & Northwestern R. R. have decided upon the construction of a new modern depot at Wichita Falls, Tex., to cost $200,000. The structure will be two blocks in length and will front on 8th and 9th streets.

The Sioux Falls & Western Ry Co. has been incorporated with a capital stock of $1,000,000 and headquarters of Sioux Falls, S. Dak., and proposes the construction of a line from Sioux Falls to Wheeler, a distance of 162 miles. The work is estimated to cost $3,000,000. The incorporators of the company are R. F. Brown, Sam Fantle, George B. Tuthill, Fred H. Hollister and George T. Blackman, all of Sioux Falls, S. Dak.

The Wichita Falls & Northwestern Ry. has purchased land at Wichita Falls and will erect machine shops to cost $200,000.

Tracklaying on the Llano Estacado branch of the Santa Fe has been completed to Floydada and as soon as the depot is completed the branch will be opened to passenger traffic.

The citizens of Hereford are planning to secure the incorporation of a company to be known as the Hereford North & South R. R. Co., for the purpose of building a railroad from Hereford south to a connection with the Rock Island in Oldham county. This line would be 35 miles long, and it is also planned to later build a line south. The company is to have a capital stock and is to begin actual operations within 90 days after May 1. Over $30,000 was subscribed at the first mass meeting called by the Hereford Commercial Club, of which L. Gough is president.

Plans are well underway for the construction of the pleasure pier at Port Arthur, mentioned in our last issue. As proposed, the pier is to be built of concrete and will cost about $100,000. Plans are also under way for further improvements to include the construction of a large artificial island and the erection of several large concrete buildings which may bring the cost of the project up to $500,000. C. A. Logan is architect. John W. Gates, Port Arthur, is back of the project.

It is believed that the Naples & Sulphur River R. R. will shortly be built from Jefferson to Clarksville. Eighteen miles have already been built from Jefferson to Linden, owned by the Clark & Boyce Lumber Co., of Jefferson, and 20 miles have already been built from Naples up the Sulphur, owned by the Sullivan-Calhoun Lumber Co., of Naples. A gap of 11 miles is to be filled up between Linden and Naples, and an extension of 20 miles from the end of the Naples and Sulphur to Clarksville. The Sullivan-Sanford Lumber Co. has bought 23,000 acres of timber in Red River county from Clarksville and Annona parties, and when the road is built it is claimed that it will have timber enough to last it ten years. The road, it is said, is to be built during the summer.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Virginia-Carolina Ry., Wilton E. Mingea, president, Abingdon, Va., is stated to have awarded contracts for part of the work for the proposed extension from Konnarock, in Washington county, Virginia, across the mountain in the direction of Charlotte, N. C. It is expected that the road will be extended to make connection with the Seaboard Air Line. There is also talk of extending it northward to the lakes, in which event it would become an important trunk line. At present the road is only about 30 miles in length, extending from Abingdon, on the N. & W. to Konnarock, Va.

The Lynchburg, Amherst & Northern Ry. Co., of Lynchburg, Va., has preliminary surveys under way for a 30-mile line from Lynchburg to either Sandidges or Louisville, by way of Amherst Courthouse.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Valley Railway & Power Co., of Kent, has secured franchise in Renton and Kent for its proposed electric railway.

J. T. Heffernan, President of the Heffernan Dry Dock Co., of Seattle, has secured 18 acres of the Seattle tide lands on the east waterway fronting on Spokane Av. He proposes to improve this property by building additional dry docks and a ship repair plant. Work will begin within a few months.

According to an announcement made by W. T. Beck, president of the Spokane & British Columbia Ry. Co., surveys have been completed into Spokane, Wash., and a franchise will soon be asked. The company has been incorporated with a capital stock of $1,000,000 and at a meeting of the stockholders Feb. 24, the following officers were elected. W. E. Beck, Spokane, president and general counsel; James J. Warren, Toronto, Ontario, vice president; F. M. Adlyn, Republic, Wash., secretary; F. M. Holland, Toronto, Ontario, general manager; O. E. Fisher, Republic, Wash., treasurer and general freight and passenger agent; Fred Demuth, Grand Forks, B. C. general superintendent.

The Northern Pacific Ry has notified the Secretary of State of its intention to extend its Sunnyside branch line to tap principal points in Yakima and Benton counties which at present have no railroad facilities. The line now runs as far as Grandview. The extension will be eastward into Benton county.

Riparian rights and land deals have finally been closed by George S. Canfield, of Spokane, representing the Ham, Yearsley & Ryrie Co. of that city, on Klickitat River for the development of the water-power near Lyle. The last deal closed was the Indian Emma Dave land on which is located the Klickitat gorge, two miles from Lyle. At this point in the gorge alone 6,000 hp. can be developed, but by extending two miles farther up the stream 12,000 hp. is available. Further extension to a total of 11½ miles from the foot of the gorge gives 30,000 hp. Water rights covering each and all these developments were located some time ago and each of the projects has been definitely surveyed and located. It is stated to be the purpose of the capitalists behind the project to commence the development this present season and that the longest line of development to contain all three sites, has been decided upon. This contemplates a long transmission line up the Columbia River to pump water for irrigation and also, it is said, a power line into Portland.

The Spokane, Portland & Seattle Ry. T. H. Croswell, chief engineer, Portland, Ore., has made an appropriation of $300,000 for 1910 to fill in trestles near Vancouver. They will be filled with what is termed "cliff droppings," and gravel from the company's pits. Work will begin soon and four or five crews will be employed. Two steam shovels will be used.

The Inland Electric Ry Co. is to at once rebuild its washed out lines at Colfax and is also planning to raise the ground for its terminal in that city.

Peter Simms, of Simms & Shields, Tacoma, is reported to have been awarded the contract for the construction of the Northern Pacific four-track railroad line from Tacoma to Tenino, known as the Point Defiance-Narrows line. The line cut off from the present Tacoma-Portland line at Tenino, in Thurston county, and runs to the Sound at the mouth of the Nisqually River, crossing the tideflats there and running along the beach through Steilacoom, Chambers creek, Lemons beach, Belmarlow and by a tunnel through the ridge at Point Defiance, coming out on the bay shore at the Tacoma smelter and thence along the bay shore, inside of the supplemental terminal yards of the Milwaukee between the smelter and Old Town, to the Oriental docks, and along under the edge of the bluffs below the Tacoma hotel and into the new union passenger station yards at 15th St., Tacoma. The total length of the line is about 42 miles.

Plans are reported to have been announced by Robert E. Strahorn, Spokane, who recently secured control of the Hanford interests at Priest Rapids, for a canal 100 ft. wide at the bottom, with a minimum depth of 20 ft., to be built from Priest Rapids to Pasco, carrying water to 150,000 acres of fertile land. About 7 miles down the river from Priest Rapids the canal will have a fall of 72 ft. and electrical horsepower will be generated. The

canal will also be used in transporting boats around Priest Rapids.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The State Railroad Commission has authorized the Milwaukee Electric Railway & Light Co. to issue another $1,000,000 of 4½ per cent bonds. The new financing will make a total of $7,728,000 of these bonds outstanding and is to be consummated to provide for extensions.

The Milwaukee Light, Heat & Traction Co. has an application before the city council of Oconomowoc for a franchise in Oconomowoc, and the right to operate a street railway in the city.

The contract for the new coal shed to be erected by the Northwestern Fuel Co. at its dock No. 1 in Superior has been let to the Heyl-Patterson Co. of Pittsburg, Pa. The company will extend the western side of the dock 600 ft., giving 350,000 more sq. ft.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Niagara Falls, Welland & Dunnville Electric Ry. Co. has been incorporated with headquarters at Welland, Ont. The capital stock is $200,000, and the provisional directors are J. G. Gardner, Geo. Arnold, F. E. Misener, G. H. Burgar, H. A. Rose. The road will run from Niagara Falls through the townships of Stamford, Thorold, Crowland, town of Welland and Townships of Haldimand, Wainfleet, Moulton and Sherbrooke, to Dunnville, passing through a number of villages on the way and probably a branch line through Pelham.

A bill is before the House of Commons to incorporate the Ottawa, Montreal & Eastern Ry. Co., which proposes to construct and operate a railway from a point in the vicinity of Lake Megantic, near St. Agnes, thence through the counties of Wolfe, Arthabaska, Richmond, Drummond, Yamaska, Bagot, Richelieu, St. Hyacinthe, Vercheres and Chambly, crossing the St. Lawrence at or near Longueuil to Montreal, and thence in a westerly direction through the counties of Hochelega, Jacques Cartier, Laval, Terrebonne, Two Mountains, and Argenteuil, and thence crossing the Ottawa River into the Province of Ontario. William I. Bishop, Arthur Jarvis, Charles E. Cutler, Victor Cusson and Maurice Tetreau, of Montreal, Que., are interested.

City Engineer Rust, of Toronto, Ont., has been authorized by the Board of Control of that city to open negotiations with Bion T. Arnold of Chicago, Ill., with a view to securing his services in preparing a report on a tube railway system for Toronto. The proposed tube system would consist only of two or three trunk lines from the congested downtown districts. A report as to cost is needed, to present to the rate payers before they vote on the scheme.

Tracklaying out of Prince Rupert, B. C., on the Grand Trunk Pacific Ry., is to be started about April 1, and it is expected to have the line finished and in operation to a point 100 miles inland before the end of the summer. W. C. C. Mehan, General Superintendent Mountain Division, G. T. P. Ry., Prince Rupert, will be in charge.

The Railway Committee of the House of Commons has passed the bill incorporating the Northern Quebec Colonization Ry. with a line from Tadousac to Lake St. John, thence to Chibougaman, and thence to Hannan Bay, Ontario. From Chibougaman it is intended also to build to Weymoutache, on the Transcontinental.

The city engineer of Ottawa, Ont., estimates that it will cost between $75,000 and $80,000 to extend the city street car lines to Ottawa East.

The Canadian Stewart Co. of Montreal, Que., has been awarded the contract to build the new drydocks at Port Arthur, Ont. The Dominion Government has guaranteed the bonds to the extent of $1,200,000.

Extensive harbor improvements are proposed for Montreal. The harbor commission of that city have decided to spend part of its new $6,000,000 Government loan in building a mammoth elevator, with a capacity of over 2,000,000 bushels. New piers, docks, improved sheds, and the raising of railway tracks are other improvements to be caried out.

Construction work, it is said, will be started on the Prince Albert & Hudson Bay Ry. as soon as a small section of the final survey is completed. Engineers are now on their way to Prince Albert to complete their surveys. It is intended to finish the first 1,000 miles of the Hudson Bay railway in two years. This completes the section from Edmonton to Prince Albert and Prince Albert to Churchill. The road then goes from Churchill to Athabasca.

Reports in Antler, N. Dak., are to the effect that the Grand Trunk Pacific is considering the extension of its line from Regina, Sask., to the boundary line, running to the north of Estevan and crossing the Souris branch about 5 miles east of Bienfait, from which point it will take an easterly course and make a connection with the Great Northern at Antler.

The Canadian Legislature has given the city of Guelph, Ont., authority to extend its street railway line to the New Central prison grounds, near that city.

The Simcoe Railway & Power Co., of Simcoe, Ont., has been given a two years' extension of time in which to begin delivering power.

Advices from St. John, N. B., state that it is reported there that the Canadian Pacific R. R. is planning a new line of railway from that city to Montreal. It is common belief that the C. P. R. owns the shore line from St. John to St. Stephen, N. B., just across the St. Croix River from Calais, Me. The rumored project is to straighten the shore line and build a new road from Calais to Mattawamakeag, Me., connect them at Calais, and use this line to Montreal. It would be much shorter than the present route via McAdam.

A bill has been introduced in the New Brunswick Legislature to aid in the construction of a railway down the St. John River Valley to St. John. The first part of the bill guarantees the bonds of $25,000 a mile, providing the federal government will operate and equip it as part of the Intercolonial, giving the Province 40 per cent of the gross receipts in lieu of interest. The second part of the bill provides the same guarantee for the steam or electric road from St. John to Quebec, via Andover, and across the state of Maine. A proposal has been made to the government by the Aroostook Falls Development Co. to construct and operate the road, using power developed at the falls for the whole line.

The Grand Trunk Pacific Transcontinental R. R. has acquired title to a large tract on the shores of Courtenay Bay, St. John harbor, St. John, N. B. This tract will be utilized for the Atlantic terminal of the new road.

Mexico Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Mexican Northern Ry., V. P. Safford, Escalon, Chihuahua, Mexico, has taken over the concession held by the Cananea Consolidated Copper Co. to build a railroad from Cananea, Sonora, to a connection with the National Railways of Mexico, between El Paso and Chihuahua. The Mexican Northern Ry. Co. owns the old Rio Grande, Sierra Madre & Pacific road, and it is stated that the line to be built under the concession will connect with that road, instead of with the National Railways of Mexico, as originally planned. The proposed road will parallel the International border for about 200 miles.

Grant Bros. Construction Co., of Los Angeles, has completed its contract on the Guaymas-Guadalajara R. R. and has moved its outfit to the United States. It is understood that the construction force is to be moved to the Southern Pacific line at Winkelman, Ariz.

Colonel Antonio Ramos Cadena and Severiano Caldereon have been granted a 40-year concession by the state of Chihuahua to build a street railway from Ortiz station, that state, to the little town of Meoqui, on the Conchos River. According to the terms of the concession, the road may be operated by horses, steam or electricity. The line will be about 3 miles long.

The Mexico Pacific R. R. Co. mentioned in our last issue, composed of Seattle and Victoria capitalists, has arranged for a State subsidy for the railroad it will build between the Pacific ports of Acapulco and Zihuatanejo, in the state of Guerrero, a distance of about 100 miles. The government will pay the company 4000 pesos a kilometer for the line between Acapulco and Cuesta, and 1000 pesos a kilometer for the line from Cuesta to Zihuatanejo. Construction is in progress. The company owns a great tract of land between the two ports, and will colonize a portion of it. Moritz Thomson, a prominent grain man of Seattle, is at the head of the enterprise.

Track laying on the San Diego & Arizona R. R. has been completed for a distance of several miles beyond Tia Juana and grading is completed for a distance of 10 miles or 12 miles below that point. Approaches to tunnel No. 1 in Carriso Canyon have been completed and the tunnel work proper has been started. Robert Sherer & Co., Los Angeles, Cal., have the contract.

Grading work is stated to have been resumed on the Fort Wayne-Bryan electric line work, which was suspended with the coming of cold weather. Grading gangs were started from Maysville, Hicksville and Farmer, O.

The Fall River Electric Light Co. of Fall River, Mass., has petitioned the State Gas Commissioners for authority to issue $200,000 additional capital stock at $140 per share for the purpose of making additions to the plant and for enlarging the property.

The Chicago, Milwaukee & St. Paul R. R. is to expend about $1,250,000 for improvements to the Kansas City division, comprising the main southwest line from Kansas City to Davenport. The work will include the expenditure of $525,000 for replacing trestle and iron bridges with concrete structures. In addition some new track will be laid and a considerable amount of reballasting done.

Northern Pacific Ry. engineers are taking advantage of the cold weather to run surveys for the construction of the proposed line from Edgeley, N. Dak., across frozens sloughs and creeks, westward through Burnstad and Linton, N. Dak. Contracts for the work will probably be let in the early Spring. S. J. Bratager, St. Paul, Minn., is principal assistant engineer of the Northern Pacific.

Business men along the Dallas line of the Chicago & Northwestern Ry. have started an agitation for an extension from New Castle, S. Dak., to Niobrara, Neb. The extension will be about 40 miles long. A. F. Wilcox, Gregory, S. Dak., is interested.

The board of trade of Phoenix, Ariz., has appointed committees to secure right of way and a bonus for the projected line of the Phoenix & Buckeye R. R. According to a proposition of L. H. Landis, general manager of the railroad, if a bonus of $50,000 is raised and right of way secured, the road will be constructed and in operation as far as the Hassayampa River by July 1, 1910.

Surveys are being made for the construction of the spur line from Bayard Station on the Santa Rita Branch of the Atchison, Topeka & Santa Fe Ry., to the government hospital at Fort Bayard, New Mexico.

Options on land are being secured for a power project which contemplates the construction of one or more large dams across the Deerfield River, between Wilmington and Reedsboro, Vt., Martin A. Brown, North Adams, Mass., is interested.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

San Jose, Cal.—Until 11 a. m., April 5, by Board of Supervisors for the construction of a reinforced concrete bridge over the Coyote River at San Jose and Oakland Road. Henry A. Pfister is Clerk.

Clinton, Ia.—Until noon, April 4, by Board of County Supervisors, for the construction of steel bridges, concrete bridges, concrete arches, concrete culverts and building and repairing of wooden bridges required by the county for one year. Frank W. Leedham is County Auditor.

Gretna, La.—Until June 1, by E. M. Hubert, Secretary Police Jury, Gretna, La., for the construction of a steel bridge across Harvey Canal in Jefferson Parish.

Harrisonburg, La.—Until April 4, by Police Jury, for the construction of Bayou Louis bridge. W. Bethard is Secretary of the Jury.

Sidney, O.—Until noon, Mar. 26, by County Commissioners, for the construction of superstructure of a 50-ft. highway swing bridge over the Miami Canal near Dawson, O.

Antlers, Okla.—Until March 31, by W. D. Parks, County Clerk, for the construction of a bridge over Anderson Creek at a point 200 yds. west of the quarter corner on line between Sec. 1 and Sec. 12.

Minitonas, Man. Until March 30, by E. Widmeyer, Secretary-Treasurer, for the construction of a 90-ft. steel Pratt truss bridge.

Calgary, Alta.—Until noon, Mar. 31, by N. E. Brooks, Division Engineer, Canadian Pacific Ry., Calgary, Alta., for the construction of the following: Concrete subway at Albert St., Regina. Sedimentation basins at Drinkwater, Rouleau and Milestone. Double 10-ft. concrete arch culvert; mileage 25.5 Laggan section. Concrete abutment for steel span; mileage 117.6 Laggan section. Concrete abutments for steel span; mileage 19.2 Red Deer section. Edmonton section—Concrete abutments for steel span; mileage 65.7 and 87.2. Concrete for subway First street east, Calgary. Concrete abutments and pier for overhead bridge E. Calgary, with pile approaches and dock. Cranbrook section—Concrete abutments for steel span, mileage 8.2 and 9.2. Sirdar section—Concrete abutments for steel span, mileage 11.0 and 62.8.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Clearfield, Ia.—Until 3 p. m., March 24, by Building Committee, for the erection of a brick and stone church building. O. A. Houghland, Chariton, Ia., is Architect.

Greencastle, Ind. Until 3 p. m., April 20, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Greencastle, Ind.

Monticello, Ind.—Until noon, April 5, by County Commissioner for the repairing of the Court House.

Fort Leavenworth, Kan.—Until 11 a. m., April 12, by Capt. William D. Davis, Constructing Quartermaster, Fort Leavenworth, Kan., for the construction of a guard house at the post including plumbing, heating, fixtures for electric lights and wiring.

Kansas City, Kan.—Until 3 p. m., April 25, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the extension, etc., except elevator, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States postoffice at Kansas City, Kan.

Calgary, Alta.—Until noon, March 31, by N. E. Brooks, Division Engineer, Calgary, Alta., for the construction of the following: Regina, brick freight shed; Moose Jaw, extension to present frame freight shed; Weyburn, frame freight shed; Medicine Hat, brick machine shop; Coleridge, frame locomotive foreman's cottage; Coleridge, six stall addition to brick engine house; Lethbridge, extension to brick station; Calgary, 18 stall brick engine house and attached machine shop; Calgary, addition to present brick machine shop; Calgary, addition to station; Calgary, standard stores building; Red Deer, brick station; Banff, station building; Laggan, station building; Macleod and Crow's Nest, six stall addition to brick engine houses; Cranbrook, Y. M. C. A. frame building; Granum and High River, frame freight sheds; C. P. R. Class "A" stations at Morse, Rush Lake, Marquis, Keeler, Loreburn, Strongfield, Glenside, St. Aldyne, Tyvan, Erskine, Strome, Brocket, Cowley, Lundbreck, C. P. R. Standard No. 5 stations at Welsh, Shepard, Hillcrest, Blairmore, McGillivray, Natal; C. P. R. Standard No. 4 section houses at Weyburn, Stoughton, Pitman, Froude, Beverley, Tompkins, Cardell, MacKid, Cummings, Larmour, Carlstadt, Stobart, Cassils, Bow Island, Banwil, Lethbridge Junction, Mitford, Keith, Yoho, Carstairs, Didsbury, Red Deer, Rosebud, Netook, Tuttle, Nisku, Lougheed, Woodhouse, Clareholm, Nanton, Aldersyde, Midnapore, Burmis, Kingsgate.

Minnedosa, Man.—Until noon, March 28, by Frank Lee, Division Engineer, Canadian Pacific Ry., Winnipeg, Man., for the construction of a station at Minnedosa, Man.

Leamington, Ont. Until 5 p. m., April 4, by Napoleon Tessier, Secy. Department of Public Works, Ottawa, Ont., for the construction of Post Office Customs and Inland Revenue Fittings, Leamington, Ont.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Jonesboro, Ark.—Until 2 p. m., April 5, by Board of Improvement of Street Improvement District No. 4, for grading, surfacing and paving with vitrified brick block pavement on gravel foundation about 23,000 sq. yds. of street. The work also includes 10,000 lin. ft. of curbing and 105,000 sq. ft. of concrete sidewalks. B. H. Berger is Chairman of the Board.

Atlanta, Ga.—Until 3 p. m., April 4, by Mayor and General Council for paving North Boulevard from Ponce de Leon Ave. to North Avenue, with creosoted wooden blocks, including about 3,500 sq. yds. B. M. Clayton is City Engineer.

Normal, Ill. Until 3 p. m., March 26, by Board of Local Improvements for the construction of vitrified brick block pavement on concrete foundation with concrete curb and a central parking on Broadway. O. L. Manchester is a member of the Board.

Kokomo, Ind.—Until 2 p. m., April 15, by County Commissioners, for the construction of a gravel or stone road in Center Township. A. B. Easterling is Auditor of Howard County.

Monticello, Ind.—Until noon, April 5, by County Commissioners for the construction of a gravel road in Liberty Township. A. G. Fisher is Auditor of White County.

Muncie, Ind.—Until 10 a. m., April 8, by County Commissioners for the improving of a public highway in Harrison Township. Joseph E. Davis is Auditor of Delaware County.

Petersburg, Ind.—Until 2 p. m., April 5, by County Commissioners for the construction of two roads in Logan Township. F. R. Bilderback is Auditor of Pike County.

Sullivan, Ind.—Until noon, April 5, by County Commissioners for the construction of a stone road in Hamilton Township, also a gravel road in Gill Township. B. C. Crowder is Auditor of Sullivan County.

Tipton, Ind.—Until 10 a. m., April 4, by County Commissioners for the construction of two stone roads. J. F. Barlow is Auditor of Tipton County.

Williamsport, Ind.—Until 1 p. m., April 8, by County Commissioners for the construction of a gravel road in Stonlon Township. Robert L. Winks is Auditor of Warren County.

Clarinda, Ia.—Until 7.30 p. m., April 12, by C. W. Stuart, City Clerk, for the construction of about 20,500 sq. yds. of concrete paving of 5-in. Portland cement concrete. Official advertisement of the work will be found elsewhere in this issue.

Fort Leavenworth, Kan.—Until 11 a. m., April 6, by Capt. William D. Davis, Constructing Quartermaster, for the construction of concrete walks, curbs and gutters at Fort Leavenworth, Kan.

New Castle, Ky.—Until April 12, by S. Bruce, Judge Henry County Court, for the construction of about 41 miles of turnpike roads. The work includes furnishing, hauling, breaking and spreading rock.

Lake Charles, La.—Until 8 p. m., March 28, by C. H. Burton, City Engineer, for the construction of 7 miles of cement sidewalk and curb.

Harrisonburg, La.—Until noon, April 4, by Police Jury, for improving 25 miles of the road in Catahoula Parish, La. The Parish will furnish grader and road machine.

Albany, N. Y.—Until 1 p. m., April 8, by State Highway Commission, Albany, N. Y., for the improvement of the following roads:

County.	Road No.	Approx. miles.
Tompkins	5043	2.59
Otsego	5037	3.50
Monroe	492	5.75
Genesee	853	4.07
Livingston	856	1.32
Cayuga	686	8.72
Ontario	5015	1.19
Oswego	46	1.12
Chenango	598-A	0.22
Oneida	761	6.32
Lewis	5036	2.61
Hamilton	5038	3.00
Fulton	542	2.69
Albany-Schoharie	5039	4.01
Nassau	5051	1.97
Sullivan	823	4.82
Suffolk	846	5.30
Dutchess	5050	2.14
Warren	5055	1.63

Albany, N. Y. Until 1 p. m., April 4, by State Highway Commission, Albany, N. Y., for the improvement of the following highways:

County.	Road No.	Approx. miles.
Tompkins	683	3.57
Allegany	801	4.68
Otsego	787	0.47
Tioga	845	4.05
Steuben	850	6.14
Schuyler	5047	1.64
Chemung	5048	2.50
Broome	834	7.50
Delaware	5045	3.04
Monroe	5046	5.77

Results of the Percentage System of Bidding in Brooklyn, N. Y.

The Bureau of Sewers of Brooklyn Borough is unique among all the bureaus of public works in New York city in its practice of requiring the percentage system of bidding on practically all construction work. This practice has incurred the protest of the General Contractors' Association of New York as being unfair to contractors and unwise as public policy. In our issue of Jan. 12, 1910, we quoted from an open letter sent out by this association its objections to percentage bidding, and raised the question as to their sufficiency. We may say here that our purpose in making the remarks we did was largely to bring out discussion. Such discussion was presented in our issue of Feb. 9, 1910, in letters from the Aberthaw Construction Co., and from the General Contractors' Association. Both letters criticized the percentage system of bidding and both represented the contractors' side of the argument. No comment was had from engineers who practice or approve the percentage system and we again editorially presented their side of the case. A further reply to our remarks from the General Contractors' Association was published in our issue of March 2, 1910. To secure if possible the engineers' arguments so far lacking in this discussion except as stated by us, we requested a statement of their case from the engineers of the Bureau of Sewers of Brooklyn Borough and were forwarded in answer the 1909 annual report of Mr. Edwin J. Fort, Chief Engineer of Sewers. We quote from this report as follows:

The results obtained have been generally satisfactory so far as the city's interest is concerned in broadening competition, in maintaining prices at a reasonable or low figure, and in avoiding unbalanced bids, and the consequent use of outside influence in overruling the engineer in his plain duty in carrying out contracts according to their letter and spirit. I do not mean to assert that the system is without fault, for it undoubtedly has a number of faults, and from the contractor's point of view sometimes seems to be unfair. The arguments advanced against its use by contractors (who are quite generally opposed to it) and which undoubtedly have some foundation in fact, are as follows:

(1) That it is too easy for those not familiar with this class of work and the particular conditions in each case, to submit bids. The detailed estimate of cost given makes public certain information which is a part of the experienced contractor's stock in trade, which it has taken time and money to acquire, and which in all fairness he is entitled to the benefits of. The best of reasons must be advanced for not awarding contracts to the lowest bidders. It is a popular notion that there is a large profit in any kind of municipal contracts. The result is that many contracts under this system of bidding are awarded to incapable men; that the quality of the work is not the best, and that profits are a minus quantity. In many cases complications and delays which arise leave the city a loser even though prices bid are very low.

(2) An incompetent engineer is not capable of preparing sufficiently correct estimates, and the way is open for an unprincipled or dishonest one to enter into collusion with contractors to defraud the city by the preparation of unbalanced estimates.

(3) That as a general thing engineers are not as capable of estimating accurately the cost of a piece of work as contractors.

The report then gives the history of the conference held to discuss uniform specifications in all the boroughs of New York, nothing having been settled. The arguments made by the General Contractors' Association (printed in ENGINEERING-CONTRACTING, Jan. 12, 1910) are given and the following reply made:

While this is perhaps not the most appropriate place to discuss at length the points raised above, it may be said they are not unanswerable. Any new system of this kind must be judged by the results. If an engineer is incompetent or corrupt there would seem to be little justification for retaining him in the employ of the city, and if he were so retained the opportunities offered under this system of bidding are perhaps no greater than under the ordinary one. I venture the assertion that the standard of honesty among engineers is fully as high as among any other class of city employes, contractors or people of other occupations or professions.

Bids submitted during the past season varied among themselves from 10 per cent to 40 per cent, while the average of all bids submitted varied from the estimates of the engineer only 2.2 per cent. This would not tend to show any superior ability on the part of contractors in general to estimate accurately the cost of such work. There is much to be said in favor of uniform specifications throughout the different boroughs of the city, yet it is not at all essential that they should be uniform. Conditions vary greatly, and if any material advantage can be gained in one borough by a particular form of specification, it would seem as if as yet no sufficient reason has been advanced why the city should not have that advantage.

It is true that the field of competition has been considerably broadened by the percentage system of bidding and inevitably new and more or less inexperienced men have entered it. This has necessitated increased labor and vigilance on the part of the engineer to get satisfactory results. It has also materially increased the labor of preparing estimates. Some complications have also arisen with contractors that would not have arisen with men old and experienced in business, but on the whole the benefits have far outweighed these disadvantages. If uniform specifications are insisted upon, however, it seems as if this system of bidding must be abandoned, because there does not seem to be a disposition to undertake it in the other boroughs, and it is doubtful whether the necessary information has been collected in every borough to enable accurate estimates to be made.

During the first eleven months of 1909, bids were received upon 131 contracts for sewer improvements in which an engineer's estimate was presented with the invitation and upon which the contractors submitted percentage bids.

The average of the lowest bids upon the 131 contracts was 91.1 per cent.

The average of the averages of each set of bids was 102.2 per cent.

The lowest bid made was 76.9 per cent and the highest bid made was 200 per cent.

The prices given in the engineer's estimates were based upon the market prices of the materials and labor entering into the construction of the work. The cost of the transportation of the materials to the site of the work was taken into account and also the local conditions at the site of the work.

The cost of excavation in the trenches has varied from 30 cts. to $1.50 per cu. yd. The cost of pumping to keep trenches clear of water is an item that influences the cost of excavation greatly.

The cost data being collected by this bureau is admirable, and so far as it goes, is of great importance. It is, however, up to the present time too incomplete and special in character to be of use except as a check on our computations. This may be readily understood when it is considered that it goes back only about two years, and covers only a few special kinds of work; and it has been largely compiled during the carrying out of contracts for which this bureau did not have this data when preparing estimates.

It must be years before sufficient data of this nature can be obtained and digested in the form that is required for general use and application. Moreover, the use of cost data obtained upon work under construction is not without risk of error, especially as there is no means of determining from a record of actual cost of work, no matter how perfect it may be, whether the contractor directed his work wisely, and employed the most economical number of men for performing the various items of work, and whether the character of labor that he was obliged, on account of the labor market, to employ, was the best and cheapest for the purpose. Again, it is always doubtful, and cannot be otherwise, what accidents may occur on a job to incidentally delay the work, and make the cost of labor unduly high. In short, it must be acknowledged that cost data in the hands of an inexperienced man are always misleading and unusually dangerous. There is but one royal road to success in estimating the cost of a projected engineering project, and that is long professional experience in the construction of such work on the part of the engineers. This experience is usually a history of successes and failures in estimating correctly, and must be assisted by all available cost data, selected with discriminating knowledge as to what of it is, and what is not useful.

It cannot be too seriously urged that the cost of a sewer constructed under certain unknown labor conditions and financial exigencies, by a contractor, who may, or may not, have had the highest capacity or skill, is no actual criteria

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

as to what a different kind of sewer (and no two are ever alike), will cost when built by a different contractor under different labor and financial conditions in a different location. Such cost data is of value only for use as a check on figures and financial conditions, and average weather conditions.

So far, it may truly be said that our cost data has only been available in a very few instances, and that for checking conclusions arrived at by our engineers from their long experience in anticipating average conditions and average expenses.

Bidders vary their bids for three main reasons, not to mention minor reasons. The first of these main reasons, is an assumption of average conditions surrounding the work to be done; the second is the probable cost of labor and materials, etc., under the assumed average conditions; and the third, is a spirit of competition purely. The ordinary contractor loves a gamble, "to take a chance and beat the other fellow," and this feeling sometimes overcomes a proper caution. The facility with which percentage bids may be put in furthers the gambling spirit, and makes for competition; at the same time it makes bidding by incompetent persons much easier than was the case under the old method of bidding. If the method is to be continued the interests of the city would be much served by the rigid enforcement of a rule that no bid would be received from a bidder who has not had sufficient experience in the kind of work proposed to know what it should cost, or how to perform it in the best manner.

The advocates of the percentage system of bidding certainly cannot get much encouragement from this record of experience. Indeed it disproves its own assertions of merit. There are several points that might be discussed in proof of this but we shall consider only one and that very briefly.

The percentage system of bidding encourages and develops a gambling instinct which has been hurtful to the calling of the contractor from time immemorial. At the present time the contractor and his business have a standing never before accorded and as the class improves the work improves and costs become more settled. Long training and experience develop the gambler into a quasi-manufacturer but whatever tends to keep the ranks recruited with irresponsible men and gamblers is not conducive to good work. It is opposed to public policy and should be discredited.

Whatever might be said in favor of the percentage system of bidding is nullified by this report from the city in which it has been given a thorough trial. The engineer recommends a rule to prevent any but experienced men being awarded contracts. City fathers are notoriously fond of a gamble and it is impossible to convince all the people that everything is all right if a man with a low bid is not permitted to take a contract. The courts when appealed to, as they often are, compel awards to inexperienced men who can show financial responsibility. A great defect then of the percentage system of bidding is that inexperienced, and, oftimes irresponsible, men will make no investigations for themselves but relying upon the judgment of the engineer will bid close to his figures.

Low costs and good methods must go together or some one will lose. Good methods come with experience and no collection of cost data, no matter how reliable, will make up for inexperience. Any system of bidding that encourages looseness in awarding contracts and runs the labor and cost of supervision up to an unduly high per cent cannot be perfect. The evils it brings may be worse than those it is meant to overcome.

The obvious thing to do is to employ competent engineers and keep them as long as they continue to develop. Encourage systems of cost keeping and study of work management so these men will each year be better fitted to control the spending of the public funds. Treat contracting as a serious business and not as a gamble so that ultimately a proper spirit of harmony will be developed and even the dread subject of unbalancing bids will be understood and it may be done at times openly when financial considerations warrant.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Cost of Constructing a Reinforced Concrete Fence Around a Shaft Top.

BY F. LAVIS, M. AM. S. C. E.*

The following article describes the design and construction of a concrete wall or fence around the top of the shaft of the Pennsylvania R. R.'s New York tunnels at Weehawken, N. J. It was desired to build a fence which would not only be a protection against accidents by reason of persons falling into the shaft, but which would also be discouraging to the efforts of the small boy to climb on or over it and throw things down on passing trains. It was decided that the fence should be 8 ft. high and, of course, necessarily tight.

For about two-thirds of its length the space available on which it could be built was the width of the top of the shaft wall, 2 ft. 4 ins., one side of this being on the line of the property, the other having a shear drop of about 80 ft. to the track level. The rest of the fence at the ends of the shaft was on the property line with space to work on both sides, but the design was necessarily controlled by the conditions on the long sides, which are shown by Figs. 1 and 2, the former showing the outside and the latter the inside, during construction.

The land surrounding the shaft was held temporarily under lease from the Erie R. R., and was available for purposes of construction; this ground was approximately level with the top of the shaft wall.

In attempting to design a structure for the purpose indicated, both concrete and brick were considered, but concrete was preferred, as it would harmonize better with the concrete walls of the shaft. In the case of the plan to use reinforced concrete, which was finally adopted, it was also considered that should the fence be damaged in any way (it was situated in the yards of the Erie R. R.) there would be less liability of portions of it falling to the tunnel tracks below than would be the case if brick were used.

In designing a concrete structure, consideration was necessarily given to possible methods of construction. It was seen at once that a wall 5 or 6 ins. thick, with posts at certain intervals, would be sufficient to meet the requirements, but the principal difficulty seemed to be in devising some method of removing the forms from the inside of the wall; that is, the side next the shaft after the concrete had been placed and had set.

Fig. 1—Outside Face of Reinforced Concrete Fence.

The design finally adopted was made with the idea that the panels could be cast on the ground, face down, opposite where they were to be located and then up-ended into place. With this idea the side of the panels facing the shaft was made a plane surface, the outer side having the recessed panel and projecting coping. It was intended to cast and place the panels first and build the posts afterwards. The panel was 5 ins. thick through the recessed part, 6 ins. around the edge, and the coping 7 ins. It was realized that the panels would be heavy (with the form about 4 tons each) and difficult to raise, but it was thought that this could be done and by removing the sides and leaving the face form on during the raising, without injury to the concrete. By this method the inner face would of course have been finished before the panel was set up, thus avoiding working on the narrow ledge outside the panel, and no bolt holes through the concrete would have been necessary, as would be the case were the panels cast in place.

On starting construction, however, it was found that owing to numerous obstructions near the shaft, which had not been cleared

*50 Church St., New York, N. Y.

away as anticipated, the method outlined above would have to be modified. It was decided to cast the panels upright in place and it was thought at first that a derrick would be necessary with which to handle the forms. This would have been quite feasible of course, but expensive, especially as it would have required either two derricks or double the number of panel forms actually used.

Fig. 2—Inside Face of Reinforced Concrete Fence.

As there were two different panel lengths, it was possible to make part of the forms of one length and part of the other and have sufficient forms to keep them all in use with one gang and keep that gang continuously at work. This necessarily involved working at two different points, but there was no objection to this, especially as it was proposed to mix all concrete by hand on account of the small quantity involved and the limited amount which it was possible to place in one day; 4 panel forms were used and 4 forms for the posts.

The idea of using derricks was discarded on account of expense, especially as they would each have had to be shifted more than once; the use of a small gin pole or a small builder's derrick with a hand winch was proposed, but the method finally adopted for removing the back forms, as shown by Figs. 3 and 4, proved entirely successful and involved hardly any expense for plant beyond the purchase of a couple of single blocks, a few feet of rope and a very little extra lumber.

Each of the back panel forms was built in one piece and then cut into four parts, as is shown by Fig. 4; these four parts were bolted together, as may be seen in the complete form.

A double deck platform for getting the concrete into the top of the forms was built as shown by Fig. 3 and attached to this two slanting posts framed together at the top overhanging the form, from the cross bar of which was suspended the block and fall for hoisting the back forms.

The face forms for the front or paneled side were built up of three thicknesses of 1-in. boards, arranged so as to make the projections shown, the surface coming in contact with the concrete being of tongued and grooved clear hard pine. The surface of the back forms was made of one thickness of 1-in. hemlock plank covered with a layer of ⅞x4-in. tongued and grooved hard pine laid with vertical joints. The facing of the forms was fastened to a framework of 2x4-in. spruce. An attempt was made to build the panels without bolting through, except at the bottom, but it was found impossible to keep the forms from warping. Some additional bracing was added and three 2x4s were placed longitudinally on both sides, the whole length of the forms, and bolted through, the bolts being easily pulled through the concrete before the forms were removed. No further difficulty was experienced after this was done.

The panels were reinforced by one thickness of expanded metal, 3-in. mesh, No. 10 heavy. The ends of the panels projected 4 ins. into the posts and a layer of wool felt was placed on the ends of the panels to allow for expansion and contraction.

The posts were anchored to the foundations by two 1¼-in. corrugated bars, extending 18 ins. into the foundations, and for convenience of construction four or five small ½-in. bars 12 ins. long were placed in holes drilled in the wall under each panel, which helped to hold the panel in place until the posts were built. There were four ½-in. rods in each post, wired together diagonally every 12 ins., each rod extending 6 ins. into the foundation.

The concrete was 1:2½:5 mixture, stone screenings being used in place of sand; the stone was ¾-in. and was trap rock from the tunnels. In the panels a slight excess of fine material and equal decrease in the amount of stone was used. Very little difficulty was experienced in getting a good surface on the concrete in spite of the fact that the forms were 8 ft. deep and only 5 ins. wide, and part of this space was taken up by the expanded metal which was used for reinforcement. Expanded metal was preferred for reinforcement, as there was no difficulty in keeping it flat.

After removing the forms, the surface was slightly sprinkled by using a brush dipped in water, and after being thoroughly dampened was lightly rubbed with canvas or cement bags. This was found to give a much better surface than the use of a wooden float or cement block, as these tended to expose the stone in places. After the concrete had thoroughly hardened—that is, in about two weeks—it was given a second rubbing, which gave a very uniform texture and color to the surface.

The following table gives the unit costs per cubic yard of concrete and per lineal foot of fence and does not include any profit, the foundation concrete not being included in either case.

Item	Per cu. yd.	Per lin. ft.
Superintendence	$4.21	$0.82
Labor drilling holes for anchor bolts	1.28	.25
Materials drilling holes for anchor bolts	.19	.04
	$1.47	$0.29
Labor building forms	$2.06	$0.40
Materials building forms	2.34	.46
	$4.40	$0.86
Labor setting forms	$4.04	$0.79
Materials setting forms	1.02	.20
	$5.06	$0.99
Material reinforcement	$2.28	$0.44
Concrete materials	3.74	.73
Labor placing concrete	5.21	1.02
Materials placing concrete	.55	.11
	$5.76	$1.13
Miscellaneous	$0.44	$0.09
Interest	.23	.05
Totals	$27.59	$5.40

This fence was designed and built by the writer. Mr. C. A. Case superintended the construction.

A New Floor Construction of Separately Molded Reinforced Concrete Hollow Beams.*

During the past ten years a vast amount of concrete construction work has been done (designed on various principles by different engineers) in the United States and abroad, and it has stood up with a comparatively small percentage of failures. The systems mostly employed in the United States are of the solid slab type. This also was the case in Europe at the time reinforced concrete was introduced, but owing to the increase in the cost of lumber and labor, a cheaper method was sought and certain constructors designed a fireproof building system on entirely new lines. Instead of erecting falsework and pouring the concrete in place, it occurred to these constructors that it would take less work if beams were molded on the ground and hoisted to their respective places, forming the floor. This method, having at first been contested

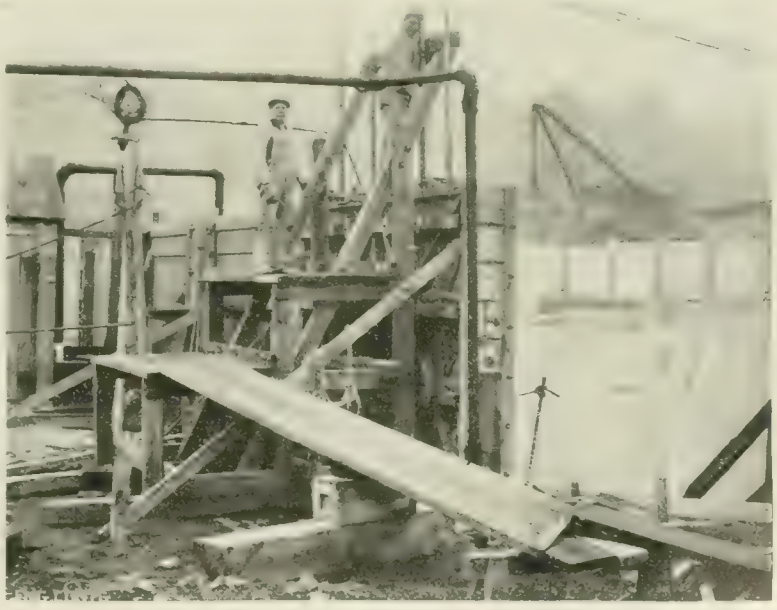

Fig. 3—View of Platform for Handling Concrete Into Forms.

*Condensed from an article furnished us by Theodore Ahlborn, Waterloo, Ia.

vigorously by the solid slab constructors, found its way to the public but slowly; but time has proved that buildings constructed on this system are quite as strong and far more economical than the solid slab types. Today it is safe to say that one-half of all the reinforced concrete buildings in Europe are constructed on what might be called the floor beam system.

Some constructors employed beams in the shape of a box, while others imitated the I beam. The first design has proved to be more economical than the latter. Recently the writer, who has had extensive experience in both the solid slab and hollow floor beam methods, has designed a novel section which he considers renders his system more economical than any of the floor beams designed heretofore. A description of this system follows:

It is known that the shape of a T used in the construction of a concrete beam is the most economical, but it has the fault that the flange does not always fulfill its duty, perhaps due to the lack of adhesion to the web, and also because it is difficult properly to place T beams without impairing their strength.

The reader will observe, Fig. 1, that the floor beam system devised by the writer is a series of T-shaped beams parted through the center line of the web and bound together where the flanges meet and having a thin slab connecting the adjacent web, thereby forming a hollow space and a smooth ceiling. The writer uses the parabola to form the air space, as he has found this to be the most economical way to secure the maximum strength with the minimum amount of material, and therefore the cheapest yet stronger construction. This also does away with the sharp corners in former T shapes where the web and flange meet.

After all the beams have been hoisted in place the small grooves, the shape of which, as can be seen in Fig. 1, is that of an I, are filled with cement grout, bonding the adjacent beams together and making the floor monolithic. Wire stirrups are also employed to aid in taking care of the shearing forces. These stirrups, the shape of which can be seen in Fig. 1, also have a hooping effect on the concrete. The writer also uses expanded metal bent to conform to the shape of the air space with a concrete margin to protect it from rust, acting in this case as a truss, therefore assisting materially to produce the claimed strength above earlier designs.

The beams are anchored to the walls and girders by means of iron anchors placed at certain intervals so that no lateral movements are possible. A floor beam system so constructed acts as a beam in one direction and as an arch in the other and tests have shown that a floor is considerably stronger than as calculated.

Fig. 4—View Showing Method of Handling Inside Panels of Forms.

The contract for the construction of the large-dry-dock and plant of the Western Dry Dock & Shipbuilding Co., at Port Arthur, Ont., has been awarded to the Canadian Stewart Co. at a figure in the neighborhood of $1,000,000. The Dry Dock Co. is assured of steady work for some time as soon as it is ready to begin operations, as it has orders for the construction of two big steel freighters. It is hoped that the keels can be laid next year.

Construction and Cost of an Inexpensive Steam Curing Oven for Concrete Block Plants With Some Notes on Operation.

The oven which I will describe to you is one which I highly recommend, and which has in my experience in the steam curing business proved satisfactory in every way. It is built 15 ft. long, 6½ ft. wide, and 45 ins. to the starting of the arch in height. The walls of the sides and the rear of these ovens are built of 12-in. smooth blocks. The arch is a true arch, giving you in the center of the oven about 7 ft. 3 ins. in height. These ovens allow us to use four three-deck cars, which allow about 100 to 125 blocks to the oven. The pallets we use are 32-in. pallets and we make blocks 4, 6, 8, 10 and 12 ins. in width. They are all 9 ins. high. Your pallets, if made properly, can be made of wood. The cleats must be well nailed and in using wide boards they will have to be ripped half way through on the under side to allow them to expand with the dampness and not to warp out of shape. This class of pallets has been used very satisfactorily and can be made out of any ordinary pine lumber, although white pine is better, but is very expensive. If pallets are made of the hard pine and properly cleated and nailed and when not in use piled in straight piles, you will find very little trouble in using the same with the steam curing. The iron pallets can be used very satisfactorily, but I would recommend that they be galvanized on account of there being some little danger of rust. While on this point of galvanizing I will speak of the cars. Any class of block cars is used very satisfactorily, but the iron of these cars above the wheels should be galvanized. This will do away with all trouble of rust. Although we are using some cars which are not galvanized, we do not have any trouble with the rust. Once in a while, however, and it seems to always happen when you make some special blocks, these cars cause trouble with rust.

Now to return to the description of the ovens; the arches to these ovens are 6 ins. thick, made of sand, gravel and cement, and reinforced with ½-in. corrugated bars, which are laid in 1 ft. apart running over the arch and running lengthwise of the arch. Your division wall answers for both arches, your arch being 6 ins. thick, wall being 12 ins., allowing two arches to rest upon one wall. By this method, when you are in need of a new oven, you only have to build one side wall, the rear wall and the arch. We use for laying our track in the oven old railroad ties, which we were able to buy second hand, sawing them off and using the best of them. Laying them about 2 ft. apart gives a very solid and substantial track. We have concreted in the bottom of our ovens so that they are very easy to be kept clean. We find that it is better to cement our floors around our tracks and around our block machine, giving you a chance to clean up and use all of the material and not having any waste like you do on the ordinary ground or cinder floor. The front of these ovens is entirely open and is covered

*Extracts from a paper by F. S. Phipps read at the 1910 convention of the National Association of Cement Users.

with the heaviest canvas that we were able to buy. In building our arch and side walls we use some ½-in. bolts, allowing them to project out 2 ins. and let them project into the concrete a sufficient distance to hold. Around the end of the ovens we bolted a 2-in. plank 12 ins. wide, covering the end of the arch with a 2-in. plank 6 ins. wide. The nuts of the bolts are sunken into the boards, giving a particularly smooth surface. We cut our canvas on a circle with the arch, and tack it fast with s ome strips of boards over the top, allowing it to roll up sufficiently high to allow the cars loaded with the blocks to be rolled in. When we have an oven full of blocks we roll the curtain down and have two or three laths and tack the edges fast. The weight of the roller at the bottom will hold it snugly to the floor, giving us the desired effect, as the curtain is used as a condenser and holds the temperature down in the oven. There should be directly over the front of the oven a ventilator of some sort to carry the steam that comes through the curtain out through the room of your building. This can be arranged as to the best advantage to the builder, but it is necessary, especially in winter time, for if you do not have an opening to carry the steam out it will collect on the ceiling of your shop and cause it to be damp and drip down on your work.

As to the steam pipes for the oven, we will start from the boiler with a 3-in. lead pipe, the pipe running about 18 ins. above the top of the arch. At each side of the oven we have a T on our lead pipe, reduced from the 3-in. pipe down to 1-in. pipe. This pipe runs directly down to within 1 ft. of the floor of the oven and about 3 ft. down on said pipe a valve where we turn the steam on or shut it off as wanted. At the end of the pipe, about 1 ft. from the floor, an elbow is attached and the same size pipe running along the side of the oven to the rear. At the rear end there is a cap placed on the pipe, closing it up. On the upper side of this pipe, that runs along the side of the oven every 15 ins. there is a ¼-in. hole drilled for the steam to escape. The steam comes out of these holes and passes up over the blocks; the blocks being cold causes the steam to condense on them very fast and fills the blocks with moisture.

The boiler that we are using is a 25-h. p. boiler, which is sufficient for twelve ovens the size we are using. It is a horizontal boiler, installed the same as any steam boiler would be for inside purposes, equipped with all the necessary fixtures, and is tested to carry 80 lbs. of steam. My advice is in all cases to have a good boiler, have it tested and carry your equipment the same as if you would carry 60 to 80 lbs. of steam. Twice a week we run the steam up to 15 to 20 lbs., blow out boiler and flues with the steam. By doing this you need never be afraid of the accidents that often happen to old boilers. You may be able to buy an old upright boiler or an old threshing machine boiler, but neither one will give you the desired effect that you need in this business. A good boiler installed properly and covered over with asbestos and the proper care taken of it will save you one-half in your fuel. You do not necessarily need to buy an absolutely new boiler, but buy a good second-hand boiler which can be bought very reasonably, have it overhauled and put in properly and have all new fittings and new pipe used, so that your joints are all tight and will not leak.

The tracks in your oven will depend upon the size of the cars you use. We use a 24-in. gage and a 7-ft. car, which allows us to put in four cars to the oven. We have expected to build some more ovens, but have not done so. I am going to build one oven a little wider than the rest of them so that our two tracks will set apart far enough to allow the car to be run in the center of the oven. By doing this way, when you have heavy material to steam cure you can handle it to a greater advantage by using cars where otherwise you will be compelled sometimes to carry it in and set it on the floor. The transfer track should be immediately in front of the oven. I have not seen any advantage in having doors in the rear of your oven. If you use the transfer car it is very easy to take the cars out and transfer them anywhere in the shop or yard.

The point I wish to impress upon you is that you must have your machinery for making the blocks as near the entrance of your ovens as possible, so it will not be necessary to transfer the blocks any great distance while they are green.

The Cost of Installing a Steam Curing Plant.—The cost of installing a steam curing oven will vary with the size of same. The size of oven that I have described, with an arch ceiling, will cost the ordinary block maker from $50 to $60, without the cost of the forms. The arch forms will cost for the making and lumber about $20 to $25, but it can be used to build as many arches as you wish. After having built one oven you have one side of the next oven. If you should build as many as four ovens you could safely say that you could build the ovens, including the arch form, for $40 apiece. Of course if you were building this for some one else you would have to charge more to receive a profit out of it, but these figures are a cost to the man who is in the cement block business.

The piping of the ovens, including the overhead pipe, will run about $12 per oven.

The boiler, the smoke stack, 25 h. p. in size, the fitting and the setting up ready for use ought not to exceed $225. You can make your own cement brick for bricking up your boiler or you can use blocks as you prefer. This can all be done by the block manufacturer himself; at least I have always been able to install the boilers and ovens without hiring any expensive labor. So that the cost of $250 for boiler complete and $40 apiece for four ovens, which is $160, and $15 for piping same, making a cost of $470, less than $75 per oven for four ovens, including everything except the track and cars that is used in same. With this class of curing ovens you will save one-half of the fuel over the ordinary upright exposed boiler and galvanized iron or plaster or tar paper oven. You would soon save the difference in the price between the cheap open and the concrete oven.

The small amount of coal that it will take to run a boiler under normal conditions will surprise you very greatly. A thousand pounds of coal will cure three to five ovens of blocks and at the price that we pay for coal, $2.25 per ton, or even figure it at $2.50 per ton, $1.25 will cure five ovens of blocks, making a cost of 25 cents per oven. You cannot hardly pay a man for sprinkling and taking care of your blocks for that amount of money. Of course your boiler has to be fired, it has to be filled with water, but you do not need a fireman all the time. He can do other work, and if you can keep a man in your factory at night he can unload the blocks that are cured and have your cars ready for you in the morning. Thereby the expense for firing your boiler and the cost of the coal will not exceed the expense of paying a man to take care of the blocks under the sprinkling or spraying process, so with the steam cure you will have the advantage of turning out the blocks in thirty to forty-eight hours and which I absolutely know is a better block than you can turn out in seven to fourteen days under the old process at no greater cost than it would to cure them under the old way, letting you use your material ten to twelve days sooner than you could use it otherwise and giving you a greater capacity for your plant, for when you have to pile the blocks out in the yard or in the shop it takes up a great deal of space.

Operation of a Steam Curing Plant.—A cement block to be good must have the proper amount of cement and the proper amount of moisture and must be tamped well to make a good product, whether you use the steam cure, sprinkle, spray or immerse. Do not think that the steam cure will make a good block out of a 1 to 6 proportion where you ought to use a 1 to 3 or 1 to 4. The sand and gravel differ as to the amount of cement that we should use and I am not discussing this point, but I want again to say that a poor proportioned block under the steam cure will make a poor block as well as under any other process of curing. In the extreme hot weather you should not let your blocks set more than two to two and one-half hours. Your ovens should be of such size and so arranged that they can be filled in this length of time. As soon as your car is loaded run it into the oven and in extremely hot weather close the curtain after each car is transferred in the oven. When you have the oven filled and the desired amount of blocks in the oven close your curtain and tack it at the sides. It depends greatly on the kind of weather and how quick the cement is setting that you are using as to how soon you must turn on the steam. This I cannot tell you. The only way is to use good judgment and the conditions that are around you. If the weather is hot and drying very fast and your cement is setting quick, you must turn the steam on immediately after closing your oven. You can turn that steam on so strong and wet your blocks so fast that they will become mushy and mash and ruin your product, but you must use judgment as to this; turn on a little steam and continue to do so until you have the capacity of your pipes. In some cases we have found it necessary to sprinkle in the ovens, but that is very seldom. We have a spraying process that we have used to some extent in reducing our heat and condensing our steam faster, but that you must learn from experience or from some one that is experienced and understands this class of work. In all cases carry your water high in your boiler. The one great point in the steam curing with my experience has been to carry the steam as moist as possible from the boiler to the ovens. Dry steam is not good for curing blocks; but do not give your blocks so much steam at the start that they will become mushy and will wash. We all well know that sprinkling will wash the cement from the outside and that there is a certain amount of the cement that is wasted, but with the steam the heat from the steam will start the block to setting and the moisture will sink into the block and you will not wash any of the cement from the block; therefore even if you could cure a block by sprinkling as good as you can with the steam you will not have as good a block for the reason that you have with the sprinkling process washed some of your cement from your block and with the steam you have not. In carrying the blocks immediately to the ovens after being made there is no chance for them to dry out as when you set them out of the building where the sun may strike them or even the current of air through the building will dry them out. When the steam is turned on you must turn it on gradually until you give the blocks the full capacity of the pipes. You must watch your boiler and not let your water get low and your steam become dry. The sound of the steam in the oven will tell you the amount of firing you need. We never allow our steam gage on our boiler to show any pressure above 3 lbs. and more often no pressure at all, and in most cases our blocks set 24 to 36 hours and are cured ready to be taken to the yard. Do not understand me that the block is as hard as it will get or as fully cured, but the point I am making is it is as good a block as you would have in 7 to 14 days under the old cure. It can either be taken to your yard or be loaded on your wagons and hauled to the jobs. We all know that blocks 24 hours old and cured by sprinkling cannot be handled with safety. The safer way is to cure your blocks from 36 to 48 hours. All of this refers to the semi-dry made block. The poured block or wet work, as we call it, does not need to be put in the ovens until it has been made from 12 to 20 hours. On this, 12 to 20 hours is sufficient to steam.

The poured work, if put into the oven immediately after making, especially if it has a troweled face and the steam turned on will scale, but if this class of work is left for 12 hours and then the steam turned on for 12 to 20 hours it will give you a product that is safe to handle and haul and to be put in a building. A great many times we have found it necessary to remove the poured work from the ovens after 6 to 12 hours of steaming and have found it very satisfactory. You can take poured work after being made 12 hours and turn the steam on full immediately after putting in the ovens without any bad effect.

A Method of Depositing Concrete by Chutes in Building Construction With Costs of Actual Work.

Depositing concrete by gravity through pipes or open troughs for considerable distances has been successfully practiced by a number of contractors during the past year or two. The most notable developments of the practice, however, have been made on the Pacific coast, where perhaps a score of important buildings have been concreted in this manner. While some notes of this work have been printed from time to time, no very clear account of the methods in detail or of its economy has appeared. The following description and notes are, therefore, of interest:

The "gravity system" of placing concrete as it is called, had its practical inception with F. O. Engstrum Co., contractors, of Los Angeles, Cal., and one of its more important early applications was in constructing the famous Christian Science Temple at Pasadena, Cal. It proved so successful in its earlier applications that this firm continued its use and gradually other contractors secured rights to employ it also. Recently all patents "pertaining to and embodying the principle of transporting concrete through a pipe or trough by "gravity" has been secured by the Concrete Appliances Co., of Los Angeles, Cal., and St. Louis, Mo., which proposes to dispose of to contractors by license the right to use the system.

The general practices of the gravity system will be best understood by referring first to the diagram plans of Fig. 1. The tower *A* carries at its top a concrete hopper *B* and a mast *C*, and at its bottom is a mixer *D* with material bins *E* and *F*. An elevator bucket *G* travels up and down the tower from the mixer *D* to the concrete hopper *B*; it receives the successive batches from the mixer, hoists them and deposits them in the feed hopper. Over one leg of the mixer in front of the hopper *B* is mounted on a step block a mast *C* which is guyed stable in the usual manner of a guy derrick. This mast revolves horizontally like a derrick mast. Just above the foot block the mast carriers an annular hopper *I* from which leads a pipe chute *J* in two parts connected by a horizontal swivel joint *K*. This pipe is supported by a boom *L* which is hinged and rigged to the mast as indicated.

In operation the concrete from the mixer is hoisted and deposited into the hopper *B*; thence it is discharged into the feed hopper *I* from which it flows through the chute pipe *J* and is run into the forms. The area "covered" by the mouth of the chute pipe is very wide. First the boom *L* has a swing of very nearly a full circle; second, the end section of the pipe beyond the swivel joint *K* has a horizontal swing of a full circle at any position of the boom and independent of the boom movement. The distribution of the concrete is, as will be observed, very flexible.

With the preceding general description, the application of the method may be more specifically illustrated by considering actual examples of work on which it has been employed. The first example selected is the Church of Christ Scientist at Pasadena, Cal. This structure is 120x120 ft. in plan and 120 ft. high with a central dome 60 ft. in diameter. The triangular tower shown by Fig. 2 was erected at the center of the building and all the concrete was poured with a single pipe line. One man handled the discharge. The cost of feeding the mixer, hoisting the concrete and delivering it in place was 12 cts. per cu. yd. The contractors were the F. O. Engstrum Co., Los Angeles, Cal. This same firm used the method in constructing the Majestic Theatre and Office Building in Los Angeles, Cal., and from a description of the work by Maybury & Parker, who designed and supervised the concrete construction, the following statement is taken:

A rather unique and uncommon method of handling concrete was employed on this building. In a convenient place, a tower was erected up one side of which the hoist track was placed and on a platform, some 30 ft. above the work on the building, was a hopper, with a capacity of two or three batches of concrete. This tower, track and hopper were elevated as the work progressed story by story. From the hopper, controlled by a gate, the concrete was run into a 7-in. galvanized iron pipe of movable sections and one or more ball-bearing joints, and delivered on the work where desired. Some difficulty was experienced at first by having either too small or too large a pipe, but it was found that a 7-in. pipe was about right, and by running a little water in the pipe before starting and afterwards to clean it out, little or no trouble was had. This gravity system was very satisfactory both to the contractor by reducing the labor force and to the engineer in charge, by doing away with the running over the form work and newly deposited concrete by a large force of laborers. It also gave a concrete of very uniform consistency in that if too dry it would choke up the pipe and if too wet the aggregate would separate. Properly handled it is very satisfactory.

Figures 3, 4 and 5 show the arrangement employed in constructing the pre-cooling ice plant for the Santa Fe railway at San Bernardino, Cal. This building is 1,212 ft. long, 132 ft. wide and 42 ft. high and contained 6,500 cu. yds. of concrete. The hoist tower was square and 172 ft. high, and concrete was passed from it to distributing towers. Figure 4 shows the method employed of supporting the pipe on top of the boom, and Fig. 5 shows the scheme of feeding two pipe lines reaching to two distributing towers. On this building a run of 253 cu. yds. of concrete in

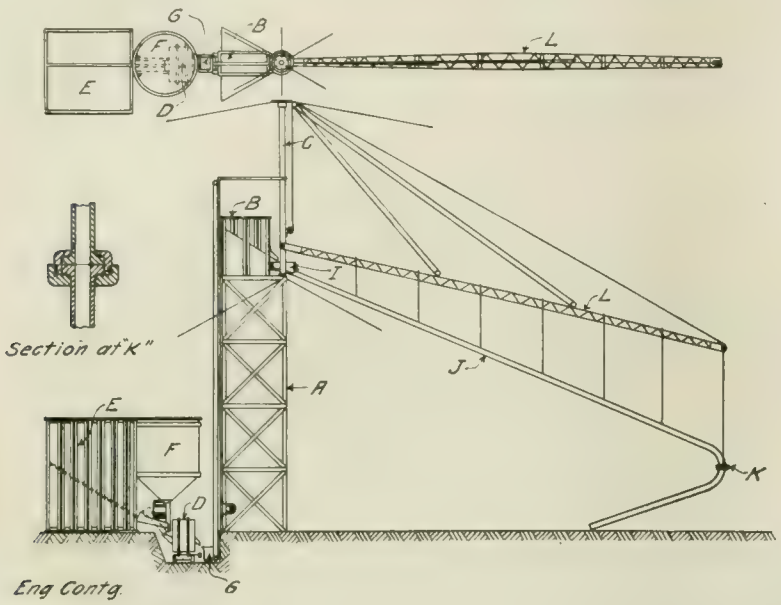

Fig. 1—Diagram Showing Arrangement of Mechanism for Depositing Concrete by Chutes.

Fig. 2—View of Triangular Tower and Chute Concreting Roof of Church Building.

9¼ hours was made. The cost of feeding the mixer, hoisting the concrete and distributing it in place was 21 cts. per cu. yd. The concrete was at times delivered 502 ft. from the mixing plant.

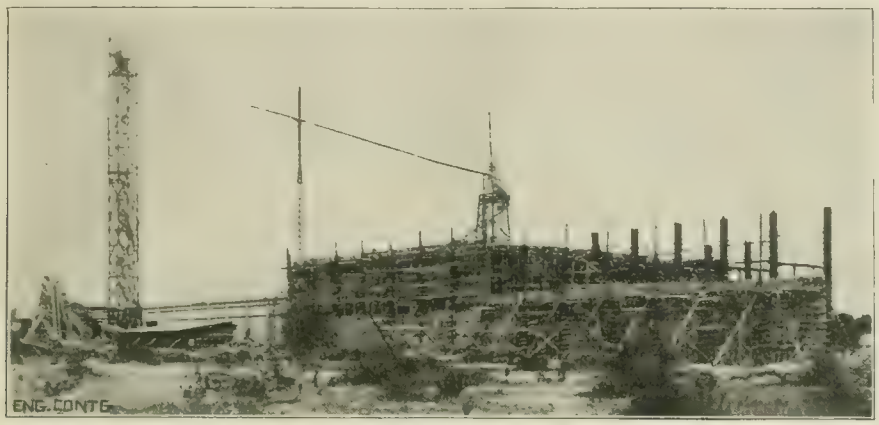

Fig. 3— Method of Chuting Concrete from Main Tower to Distributing Towers.

From a letter to us from H. W. Bryson, Manager, F. O. Engstrum Co., by whom the several buildings described were constructed, we quote the following:

Our firm, together with several other large contractors, have used the system for the last year during the issuance of the patents and they have found it successful, economical and practical from every standpoint. The photographs we are mailing you speak for themselves. They are among the largest buildings of the kind on the Pacific coast. I add without hesitancy the practical operation of the gravity system has excited keen interest among architects and engineers on the Pacific coast, and each is liberal in praises. The system has been tested and compared with the old wheelbarrow and cart deliveries of concrete from every standpoint by the highest authorities, and it excels in all points claimed. I write solely from the contractor's standpoint and not as one interested financially in getting an apparatus on the market for financial reasons. There is absolutely not a share of stock for sale.

The main points of superiority of this system over the wheelbarrow or cart method of distributing are as follows:

(1) The obtaining of the initial set of the concrete on account of the rapid handling of the mass and depositing the material into the forms in the shortest given time.

(2) A uniform homogeneous plastic mixture due to the large quantity which can be poured at one time.

(3) The unlimited variation of design of buildings to which it is adapted, from the simple foundation and dam work, to the most complicated dome, column and frieze work, such as found on tall buildings and overhanging cornices.

(4) The use at all times of a standard equipment for the entire process of mixing, transferring and pouring, and which can be executed at a minimum expense.

(5) The saving of breakage of hollow tile and displacement of steel on floor work, also saving of the spilling of concrete and cost of cleaning floors and beams afterward, which cannot be avoided when using the wheelbarrow or cart method. Also the cost of labor and material in building runways.

(6) The assurance of deep, narrow walls being perfectly filled.

(7) The handling of large quantities, the output being limited only by the mixing and hoisting capacity of the plant, thereby effecting a monolithic construction.

Quality is always to be considered first. This system absolutely assures the quality. Next in importance is that of cost. In this respect this system excels all others by comparison. The old wheelbarrow method of mixing and distributing costs per cubic yard from 60 cts. to $1; by the use of carts it runs from 40 cts. to 75 cts.; by the use of "gravity system" it costs from 15 cts. to 25 cts. This is the most apparent saving, but there are many others of vital importance, such as delay to work due to the shifting of planking or platforms and staging, the displacement of tile, steel, etc. The putting up and taking down of scaffolding is uncertain as to cost and very often a slow process. The patching and replacing of concrete which sets prematurely is avoided. The use of tampers is not required.

Shovel Record Broken on Panama Canal.—On Mar. 5, 1910, all records for daily excavation since the commencement of work on the Panama Canal were broken by steam shovel No. 213. During a working day of eight hours this shovel excavated 4,009 cu. yds. of rock and earth. It required 211 Lidgerwood flats to contain the material removed in loads. The shovel was under steam 8 hours, was actually digging 7 hours, and was waiting for cars, etc., 1 hour. Other high daily records were also made. During the same day 16 shovels working in the same district excavated a total of 26,152 cu. yds. of rock and earth. The shovels were under steam 128 hours, the actual time spent in digging being 83 hours and 50 minutes. On Feb. 26 16 shovels excavated 25,968 cu. yds. of rock and earth in actual working time of 93 hours. During the month of February the total amount of material excavated in the Central Division was 1,546,267 cu. yds, of which 413,131 cu. yds. was classified as earth and 1,133,136 cu. yds. as rock. Of this quantity 1,503,223 was removed by steam shovels. The high record for the month was made by shovel No. 214, working 23 days in the Culebra district, which excavated 50,677 cu. yds. of rock, approximately an average of 2,200 cu. yds. per day.

Cost of Cleaning Catch Basins.—At Cambridge, Mass., during the year ending March 31, 1909, 2,742 catch basins were cleaned, the average amount of material removed being 2.15 loads per basin. The cost of cleaning was $2.92 per basin and $1.81 per cu. yd. of material removed.

John Ferguson Co., of Paterson, N. J., have been awarded the contract for the buildings to be erected at Cape Charles, Va., for the New York, Philadelphia & Norfolk Ry. Co. The contract calls for a power plant, machine shop, erecting shop, blacksmith shop and a roundhouse. Work will begin within 30 days.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Method and Cost of Snow Removal in St. Louis, Mo., by Flushing It Through the City Sewers.

Snow removal from city streets is emergency work involving a sudden and large increase in the street cleaning forces. It cannot be foretold when the task will occur or what its magnitude will be. When it comes it has to be performed and performed with dispatch; cost is an almost negligible factor in comparison with these necessities. It thus comes about reasonably enough that few of the operations of keeping clean streets are ordinarily performed at such high cost and with such makeshift organization and apparatus. Recently, however, there has been more attention paid both to methods and facilities than formerly. Machinery has been introduced to a considerable extent in place of hand labor and systems of collection and disposal have been more carefully planned. It is a matter of interest then when an efficient and economic method comes to notice, such as has been worked out in the city of St. Louis, Mo., during the past winter.

St. Louis, like Boston and a good number of other large cities, cleans its streets from snow as it does its other street cleaning work by city forces. The department of streets handles the work with its own men and apparatus augmented when occasion demands by hand labor and machines. The special system described here is more particularly that employed in the retail business district shown by the sketch map, Fig. 1. It is one developed by Mr. James C. Travilla, commissioner of streets, and we are indebted to him for the information given here concerning it. Simply described it consists in collecting the snow by scrapers and by hand sweeping and hauling it to special snow traps built over the main sewers into which it is dumped and flushed away by hose streams.

Referring to Fig. 1, the solid black circles show the locations of the snow traps. The outline circles indicate the stations where the foremen are stationed to direct the work. The snow cleaning force comprises the regular street cleaning forces and apparatus, to which are added the men and teams of the garbage collection force and when necessary hired teams. Immediately after each fall of snow the inspectors, foremen, laborers and teams report to their assigned stations and the work is directed by the foremen and inspectors, who so distribute the force and arrange the hauling that there is a minimum of congestion.

In collecting the snow use is made of road machines to supplement hand labor wherever their use ensures economy. The hauling is done in wagons and carts. It is the experience of the department officials that the most convenient vehicles are the end dump carts belonging to the garbage collection service; these carts discharge conveniently and cleanly into the snow traps. Figure 2 shows one of these carts dumping its load. Next to these carts bottom dump wagons with straight sides dump with least trouble. Bottom dump wagons with enlarged tops and flaring sides cause trouble from the wedging and arching of the snow. Slat bottom wagons are most inefficient, the load having to be shoveled out.

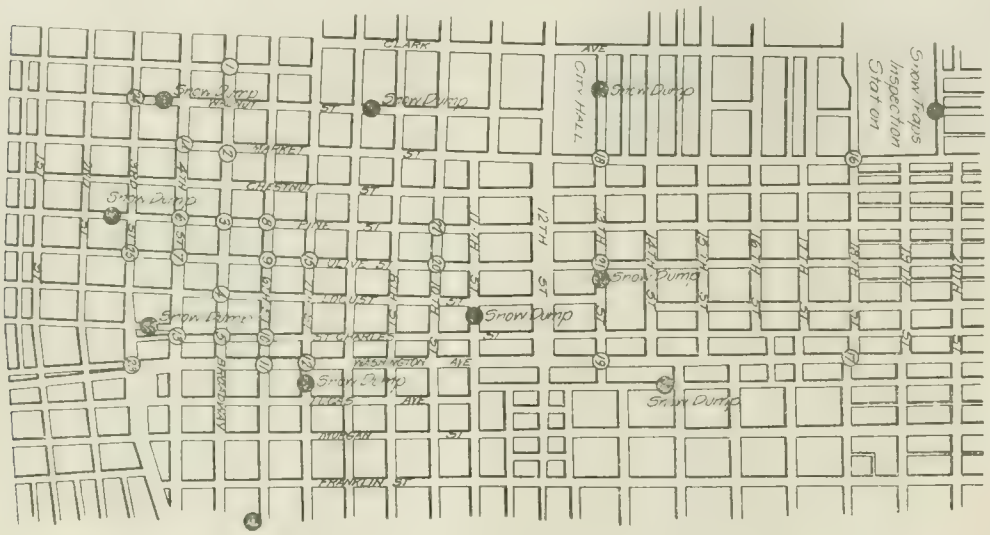

Fig. 1—Plan of Business District of St. Louis Showing Location of Snow Traps and Foremen's Stations.

A view of one of the snow traps is shown by Fig. 2. The actual construction of the trap is shown by Figs. 3 and 4. Fig. 3 shows a cross section, longitudinal section and top view of the trap. The covers are of iron plates, but these are placed next the curb during the time of snow removal, as shown by Fig. 2, and the wooden trap cover, shown by Fig. 4, is used. Men having hooks in their hands pull the cover over the hole so the team may walk across. When the wagon is in position the cover is hooked on to and slid endways until the hole is open enough to receive the load. The water is allowed to run all day and is turned on and off by means of the valve shown, this valve being operated by the hook used on the trap covers, a hole being made in the valve handle for this purpose. It should be noted that there is no heating of the snow. The water from the city mains impinging with great force on the snow quickly melts it and there has been no trouble at any time from clogging or freezing.

The snow traps as described above have cost on an average about $365 each. The cost of individual traps is governed both by the depth of the sewer and by the work required to connect the water pipe and trap nozzle. The cost of snow removal by this system obtained by dividing the quantities removed into the total cost figures out about 16 cts. per cu. yd. The wagons and carts used are figured carefully for volume and the yardage of snow is obtained by multiplying these volumes by the number of trips.

While owing to the fact that local conditions determine the cost of snow removal, a comparison of costs in different cities is not of great value, yet it is of interest to note the above costs in connection with the costs given in the report of Mr. Samuel Whinery, published in our issue of Dec. 22, 1909. Mr. Whinery gives the cost of removing snow per cubic yard in Boston and in New York as follows in 1906-7:

Boston	55 cts. per cu. yd.
Manhattan and Bronx	16½ cts. per cu. yd.
Brooklyn	21½ cts. per cu. yd.

In Boston the work was done by the street department forces and in New York it was done by contract.

Summarizing, the work in St. Louis is notable for the thoroughness of the organization which has been developed in the street department forces for this emergency work and for the means of disposal which has been devised.

Fig. 2—View Showing Snow Being Dumped into Traps.

Effect of Motor and Horse Traffic on Macadam Roads.*

Previous to the introduction of the motor vehicle, the broken stone or macadam road met the conditions of rural horse-drawn traffic better than any other type. Under fast motor traffic, the macadam road has proved to be quite unsatisfactory. Perhaps a clearer understanding can be had of the difference in effect between motor and horse traffic on road surfaces by a brief review of the development of the broken stone road.

*Paper read by Logan W. Page at the National Legislative Convention at Washington, D. C.

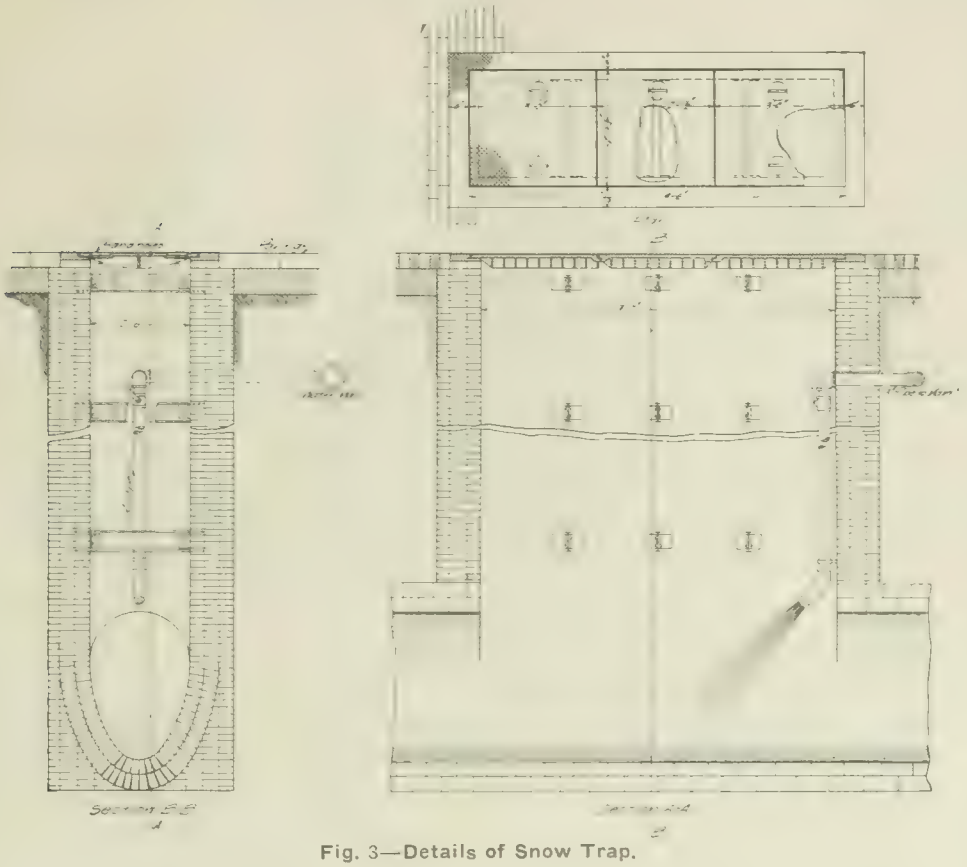

Fig. 3—Details of Snow Trap.

There is little doubt that the use of broken stone on roads antedates history. The first treatise written on the subject, however, was by a French engineer named Tresauget, in 1775; and the world is indebted to Tresauget for devising the first system of continuous road repair. This system is admirably exemplified by the French government in the maintenance of its splendid roads. Forty years later valuable contributions were made by MacAdam and Telford in England, and in comparatively recent years the introduction of time and labor saving machinery has done much to perfect and lessen the cost of construction.

The modern broken stone road is the result of a slow development and is designed to meet the requirements of horse drawn traffic. In this type the rock dust fills the voids between the stones and acts as a cement or binder. Under ideal conditions this road should be constructed of rock so suited to the volume and character of horse drawn traffic that only enough fine dust is worn from the stones of which it is composed to take the place of that carried off by wind and rain. When these conditions are met the fine dust resulting from the wear of traffic forms with the stone a smooth, impervious shell, shedding the surface water and protecting the foundations.

It was quite generally believed by engineers before the introduction of motor traffic that at least 60 per cent of the wear on roads was due to the action of horses' feet. Consequently when the motor vehicle was first introduced, engineers and others having charge of roads welcomed this new type of vehicles, believing the soft pneumatic tire would have rather a beneficial effect, if any at all, on the road surface. As the number and speed of motor vehicles increased, however, it was soon found that the cost of maintenance also increased, until at the present day most highway engineers consider the old method of constructing and maintaining broken stone road increasingly inadequate, and are experimenting with every known type of binding material other than rock dust to cement the stones together.

The first effect observed from fast motor traffic was an excessive amount of dust raised from the road surface, and many theories were advanced to account for this phenomenon, which is obviously injurious to the road. Aside from the minor effects of the motor vehicle on macadam roads, there are two very distinct ways in which the principal damage is done. The first is the tangential stress or the tendency of the rapidly moving car to leave the road at curves, which subjects the surface to great transverse strains where the ordinary crown or camber is used. This difficulty may be easily overcome by raising the outer side of the road. The other injurious effect is the shearing stress of the driving wheels on the road surface. This action is very similar to a circular saw going through a board, and it is a matter of common observation that the dust from a road surface is thrown up almost entirely by the rear or driving wheels. The effect on a road subjected to much fast motor traffic is to denude the surface to a great extent of the fine binding material, which results in the larger stones in the road becoming loose. It further results in greatly increased tractive resistance, and water makes its way freely to the foundation, and a general disintegration of the surface takes place.

As the pneumatic tire wears off no fine dust to replace that carried away by wind, rain and traffic, it can be seen that as motor traffic increases a point is reached where the type of road has to be changed. This point varies with the volume of horse traffic and the volume and speed of motor traffic. Although this seems a paradox, this condition may be said to be in part brought about by a failure of the motor vehicle to produce sufficient wear on the road surface. A great deal of work has been done in the past few years by engineers and chemists to meet this new condition, and I think it quite safe to say that it has been satisfactorily met as far as either type of traffic is concerned. We can build a road that will perfectly suit horse traffic, or we can build one that will perfectly suit motor traffic, but no type of construction has been devised for satisfactorily meeting both classes of traffic. Roads built of brick, concrete, bituminous materials and the various dust inhibitors are subjected to little or no wear from motor traffic, but are worn out by the action of horses' feet and narrow tired, overloaded horse vehicles. Besides, these types of hard pavements are quite injurious to horses.

In 1908 the republic of France held an International Road Congress at Paris for the purpose of considering the adaptation of highways to modern traffic. There were 27 nations officially represented, as well as many interested organizations and municipalities. It was decided at this congress that at low rates of speed the motor vehicle was "no more injurious to the road than ordinary traffic, but at high speeds the motor car causes the disintegration and destruction of the road." Experiments conducted by the U. S. Office of Public Roads seem to bear out this conclusion, as photographs taken of the motor cars moving at various rates of speed from 10 to 20 miles an hour show comparatively little dust, while at speeds of over 20 miles, the dust increased in proportion to the speed. Quite recently I addressed the following question to all of the state highway commissions and a number of highway engineers: "At what rate of speed do you consider motor vehicles to be more injurious to the ordinary macadam road than horse drawn vehicles?" Answers have been received from about one-half those addressed, and the majority of these experts state that at speeds not exceeding 20 miles an hour motor traffic is not more injurious to the ordinary macadam road than horse traffic. This comparison involves not merely speed as a factor, but also taken into consideration the destructive action of horses' hoofs, narrow tires and heavy loads.

Briefly, the situation as we find it today is that the automobile at the speeds at which it is generally run on the public highway is injurious to the ordinary macadam type of construction and the horse vehicle is injurious to the road surfaces treated for dust prevention.

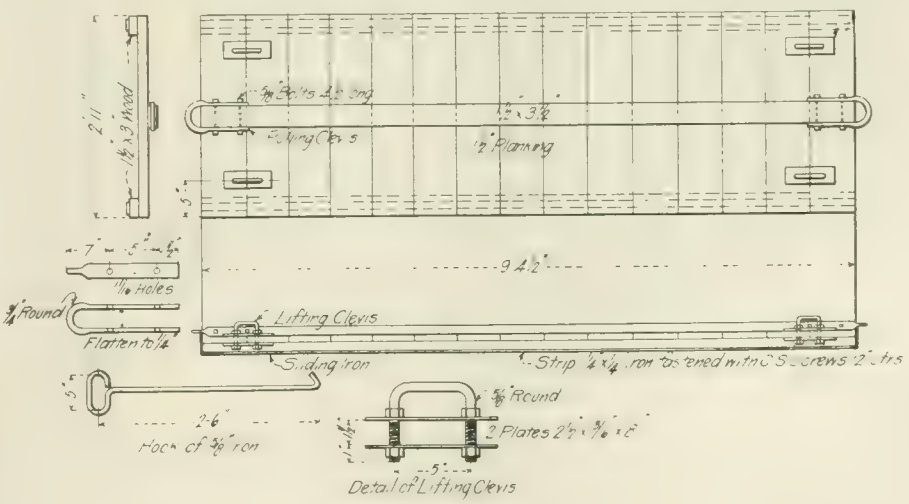

Fig. 4—Wooden Cover for Snow Trap.

The great problem confronting highway engineers is therefore to determine how this situation is to be met. There are laws in almost every locality in this country designed to limit

the speed of automobiles to a sufficient extent to prevent their seriously damaging the road, but nowhere that I know of are these laws enforced, nor do I believe it practicable to enforce them. If we cannot control the speed of motor traffic in the infancy of the motor era, how can we expect to cope with it in the future, when we consider that cars are being manufactured now at the rate of about 10,000 a month?

In my judgment the wisest traffic regulations are those enforced quite generally in France and England. They prescribe no arbitrary speed limit, but empower police officials to make arrests for reckless driving, whether the speed be high or low. It must be apparent that there are conditions under which a speed of 10 miles an hour is far more dangerous than 40 miles an hour under other conditions. These regulations take into consideration not only speed with reference to existing conditions, but the care and skill of the driver. I believe the automobile associations can render incalculable service by throwing the weight of their influence actively on the side of the safe and sane use of the public road. The great majority of automobile owners condemn the speed mania and reckless driving, and many associations have officially placed themselves on record for a conservative use of the road.

It was estimated that on November 1, 1908, there were in the United States about 150,000 automobiles with an original value of upwards of $250,000,000. The output in 1908 was 55,000 cars, for 1909 about 80,000, and preparations have been made for the manufacture of from 175,000 to 200,000 in 1910. This development is all the more remarkable for the reason that this industry was only begun a few years ago. Almost the entire output of cars has been for passenger transportation, but I believe the next ten years will witness a great development in freight transportation on public roads by motor vehicles. Last August the Massachusetts Highway Commission made a census covering a period of a week of all traffic passing over the state highways. There were over 200 stations where records were taken, and the results showed that 42 per cent of the entire traffic over these roads was motor traffic.

The horse is limited in power and speed, but so rapid has been the development of the country's agriculture and commerce that in spite of the advent of the motor vehicle the number of horses in the United States increased from 1900 to 1909 over 4,000,000, and their value has trebled. Wherever a road exists with a smooth, hard surface, the horse should be outclassed by the motor vehicle in the transportation of commodities to markets and shipping points. I do not believe it too prophetic to say that motor transportation from the farm to the market will contribute much to lessen the cost of food. Mr. Blackwall, an eminent English engineer, makes the following statement in regard to this point:

"It may be taken now as a fact, whether the majority of the public like it or not, that haulage by traction engine is cheaper and more reliable than horse traffic for all heavy work, provided the roads are fit to carry it. The use of the traction engine is therefore bound to increase, and highway authorities must make up their minds that the strength of the roads must be proportionately augmented to meet the requirements. A proof of this may be found in the growing difficulty experienced by highway authorities to prove a claim against traction engine owners for extraordinary traffic."

As an example of this, large supplies of food products from the territory surrounding London are transported to the city in trains of cars drawn by traction engines, and these trains return to the farms with manure and other necessary supplies. The value and economy of motor transportation in cities for freight has been demonstrated, and the economy of building roads over which it can travel in the country will become more and more evident to the tax payers in rural districts. Already the farmers are becoming owners of motor cars, and when this conservative element of our population utilizes to the fullest extent the advantages offered by the motor car for business purposes, much of the prejudice and many of the faults attendant upon the present opening automobile era will disappear.

In my judgment, much unwise legislation is being indulged in, both in relation to speed and taxation of the motor car, which will have to be repealed or ignored later on. Excessive taxation and unreasonable speed regulations will only retard the development of motor transportation along the more useful lines. Legislation now against a rich man's toy may later on be against a poor man's economy. The only points of superiority which this new means of transportation possesses over the horse drawn vehicle are power and speed, and it is only by the exercise of these agencies that it can be useful to man. The dust nuisance did not originate with the motor vehicle, but as a matter of fact the dustless road has been developed to meet this form of traffic.

A curious phase of this controversy was recently developed in London by some automobile enthusiasts, the automobilists claiming that the horse involves far more expense upon the maintenance and street cleaning department of the city government, and is a much more serious menace to health than the automobile, and in urban districts there is much truth in this assertion. If the street departments of our cities had only motor traffic to contend with, the scavenging bills would be very much lessened and dust reduced to a minimum. From this, together with the fact that about 99 per cent of all house flies are bred in manure, it can readily be seen that public health would be greatly benefited by the substitution of motor vehicles. This, however, is a phase of the subject beyond the province of the highway engineer, who for many years to come will be occupied in designing roads to meet both classes of traffic, and where motor traffic is sufficiently great, in constructing dustless roads.

Cost Data On Macadam and Gravel Roads Construction in Peel County, Ontario.

A considerable part of the road improvement work in the Province of Ontario, Canada, is done under the County System, according to the regulations of the Provincial Public Works Department. At the recent meeting of the Ontario Good Roads Association Mr. C. R. Wheelock, County Engineer of Peel, read a paper, giving some little cost data on several roads built in 1908 and 1909 on the County of Peel road system. The matter that follows has been actuated from Mr. Wheelock's paper.

The wages paid on the road construction work in 1908 and 1909 were as follows:

	Per day.
Ordinary laborers	$1.50 to $1.75
Road foremen	2.00 to 2.50
Machinery engineers	2.50
Teams	3.50 to 4.00

The cost of operating road machines was from $13.50 to $14.50. In some cases traction engines were used on the road machines instead of horses, with good results. The cost of operating was less, and it is estimated that on a clay road and in hot dry weather nearly twice as much work can be done.

The cost of operating the steam rollers was from $3.90 to $4.50. To this may be added the cost of sprinkling, $4 per day, making the total for rolling and sprinkling about $8 per day.

For the roads in the south part of the county crushed stone was brought in by rail, as satisfactory local material was not available. This added very much to the cost of these roads, as in some cases the freight was double the price of the stone, f. o. b. at the quarry.

The accompanying tabulation shows the actual cost of nine roads built in the county in 1908 and 1909.

Road No. 1 was surfaced with crushed stone. The road was well graded, knolls being cut down and hollows raised. The metal was consolidated into a steam roller. As no local material was available, crushed stone was brought in by rail. The freight on about one-half the stone was 65 cents per ton, and on the remainder, which was delivered at another station, it was $1 per ton. The price of the crushed stone f. o. b. at the quarry was 50 cents per ton.

Road No. 2 was surfaced with pit gravel. It was well graded. The gravel was spread evenly on the road early in the summer, without being rolled, and in the fall when the gravel was partly consolidated by the travel over it, it was gone over a second time, the ruts filled and the road recrowned.

Road No. 3 was surfaced with crushed stone and was similar to road No. 1, except that there was a greater depth of metal, and that the stone was all shipped to the same station, the freight being 65 cents per ton.

Road No. 4 was an old stone road, wide and flat on top. The grading consisted mainly of cutting off the shoulder, although in some places it had to be regraded and ditched. Crushed stone was placed in the center of the road for a width of 9 ft., and along each side of this was placed a strip of pit gravel about 3 ft. in width, forming a boxing for the stone and making the total width of metal about 15 ft. The metal was well consolidated with a steam roller.

Road No. 5 was surfaced with crushed stone. It was similar to road No. 1, except that the stone was all shipped to the same station, and that the freight was 60 cents per ton, and the stone f. o. b. at the quarry was 65 cents per ton.

Road No. 6 was surfaced with pit gravel. It was similar to road No. 2.

Road No. 7 was surfaced with crushed stone, and the construction details were similar to road No. 3.

Road No. 8 was surfaced with crushed stone and screened gravel. It was well graded, the knolls cut down and the hollows raised. The metal was well consolidated with a steam roller. The metal used was a coarse gravel mixed with stones, which was run through the crusher and revolving screen.

Road No. 9 was surfaced with gravel and clay. This was a short piece of road built as an experiment. The soil was very light sand.

TABLE SHOWING THE COST OF 9 ROADS IN PEEL COUNTY, ONTARIO.

Road No.	Width of grade. Feet.	Cost of grading per mile.	Class of metal.	Width of metal. Feet.	Depth of metal. (Consolidated). Inches.	Freight on metal.	Length of haul for teams for metal. Miles.	Cost per mile.	Total cost per mile.
1.	28	$126	Crushed stone.	[illegible]	[illegible]	$1,304	13¼	$3,145	$3,271.00
2.	24	195	Pit gravel.	[illegible]	[illegible]	Local	1	685	880.00
3.	24	175	Crushed stone.	[illegible]	[illegible]	1,005	3½	3,557	3,730.00
4.	27	145	Crushed stone & pit gravel	15	4	857	3½	2,170	2,315.00
5.	27	200	Crushed stone.	8	[illegible]	876	11¼	2,808	3,008.00
6.	24	272	Pit gravel.	[illegible]	[illegible]	Local	1	528	800.00
7.	32	190	Crushed stone.	9	[illegible]	940	2¼	3,214	3,404.00
8.	24	200	Crushed stone & screened gravel.	8	6	Local	2½	1,750	1,950.00
9.	26	85	Gravel.	8	9	Local	...	650	1,215.00
			Clay	9	5	.....	..	480	.....

The Gilmore & Pittsburg R. R., now under construction, has bought a 75 acre tract in Dillon, Mont., on which will be erected yards, roundhouses and shops. At present the headquarters of the surveying forces on the Salmon River for the Gilmore & Pittsburg are located at Lewistown, Idaho.

A Road Roller with New Front Truck Arrangement and Improved Details.

The accompanying engraving shows a road roller having a front truck construction essentially different from that usually employed. Figure 1 is a diagrammatic line drawing showing the arrangement more clearly. The front roller *A* is journaled into a cast ring or turntable *B*, and this turntable sets inside of and concentric with a circular ring *C*, which is connected by an A-frame *D* to the rear frame of the machine. The circular ring and connecting A-frame form the front truck frame of the machine from which the standard supporting the front end of the boiler rises as shown by the illustrations. The turntable *A* engages the circular ring *B* by means of a set of vertical rollers *E E* and another set of horizontal rollers *F F*, which permit it, with the front roll, to rotate horizontally within the circular ring *B*, which acts as a track. To actuate rotation there is a pinion *G* operating a sprocket chain, which connects with two pieces of wire rope encircling and fastened to semi-lunes *H H*, on the top of the turntable and on each side of the front roll. The shaft of pinion *G* rises out of a cast box and carries a pinion at its bottom within the box, which meshes with a worm actuated by a steering rod extending back and terminating in a hand wheel in the operator's cab. The cast box within which are the worm and lower pinion is filled with oil. It will be noted that the steering gear acts positively, with practically no slack.

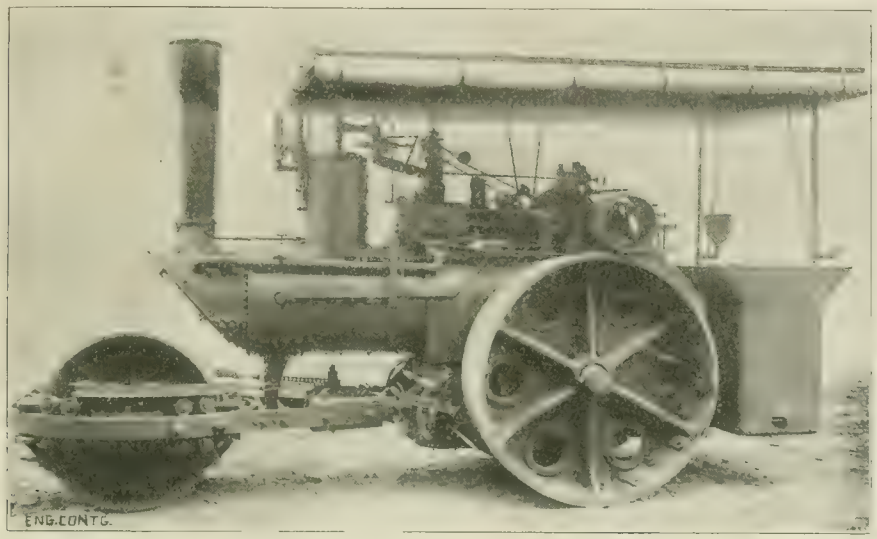

Fig. 1—View of Geiser Road Roller.

It will be noted that the A-frame *D* connects with the rear frame by a horizontal journal and that this journal is in the same horizontal plane as the axles of the front roll. This construction gives an oscillating front truck which can tip independently of the boiler and which is unusually stable because of its low center of gravity. Steering is also made easy because the front roller does not pinch or "bind" whatever its inclination may be. Also since the front truck tips independently there is reduced side sway to the front end of the boiler. Summarized the advantages claimed for this front truck construction are increased stability of the machine as a whole, increased stability of the front roll practically eliminating danger of upsetting, decreased side swing of the front end of the boiler, and a great gain in the ease of steering.

Other merits claimed for this roller are double cylinder engine, double drive and compensating gear, large front roller, short wheel base and arrangement of rear rollers to cover a minimum width of road bed of 8 ft. 8 ins.; free access to front end of boiler and particularly sturdy construction throughout. The following is a detailed description of the 12-ton roller illustrated:

The engines are double cylinder, each 6-in. bore by 7½-in. stroke; revolutions of engine shaft per minute, 280. The maximum indicated horse power for 160 lbs. boiler pressure, 280 revolutions, and 68.8 per cent cut off, is 72 H. P. The cut off is variable with the position of the reverse lever, and the latest possible cut off is 68.8 per cent of the length of the stroke of the piston. A piston valve 1¾ ins. in diameter is used. Open hearth steel gear is used and the gear is double drive. Springs are incorporated in the compensating gear arrangement to insure equal load distribution for the different pinions and to give it ability to absorb shocks without injury to the construction. All gearing is encased in practically dust proof casings. The countershaft is 4¼ ins. in diameter in boxes; the drive axle is 5 ins. in diameter in boxes; the front roller axle is 4½ ins. in diameter in hubs of rollers, and the steering hand wheel shaft is 19⅛ ins. in diameter. Each driving roller is 20-in. face and 64 ins. in diameter. The driving rollers are tapered, the inside edge having a diameter of 63 ins., while the outer edge is 64 ins. in diameter. Each driving roller is equipped with 24 tempered, removable steel spurs. The front rollers are two in number, each with a straight face of 20 ins. and a diameter of 44 ins. For all the scrapers the holding on power is transmitted through springs, thus producing the elasticity necessary to compensate for clearances caused by worn bearings. The scrapers for the driving rollers are operated by hand levers, each lever actuating two scrapers at a time.

The total coal capacity is 700 lbs. heaped and the total tank capacity is 247 gals. The total weight of the roller is 24,560 lbs. For working condition the weight on the driving rollers is 10,650 lbs. and on the front roller 6,700 lbs. The roller will make 2.178 miles per hour for governor speed.

The machine can be used to pull a road grader or rock crusher from place to place and for driving the rock crusher in stationary work. Stationary drive is accomplished by means of a leathered pulley 15 ins. in diameter and 9-in. face. This pulley is mounted on the overhanging end of engine shaft, and has a key integral with its hub, made to fit that key way in the engine shaft which served the engine shaft pinion. The pulley is pushed up against this pinion in its outer gear position and is kept from slipping endwise on the shaft by a set screw. In this position the inside edge of the pulley rim comes only 3½ ins. from the outer face of the engine shaft box and also in line with the inner edge of the left hand driving roller. The belt is run backward over the left hand coal box, which in order to allow proper room for the belt is made collapsible.

This road roller is made by the Geiser Manufacturing Co. of Waynesboro, Pa., to which we are indebted for the information from which the above description has been prepared.

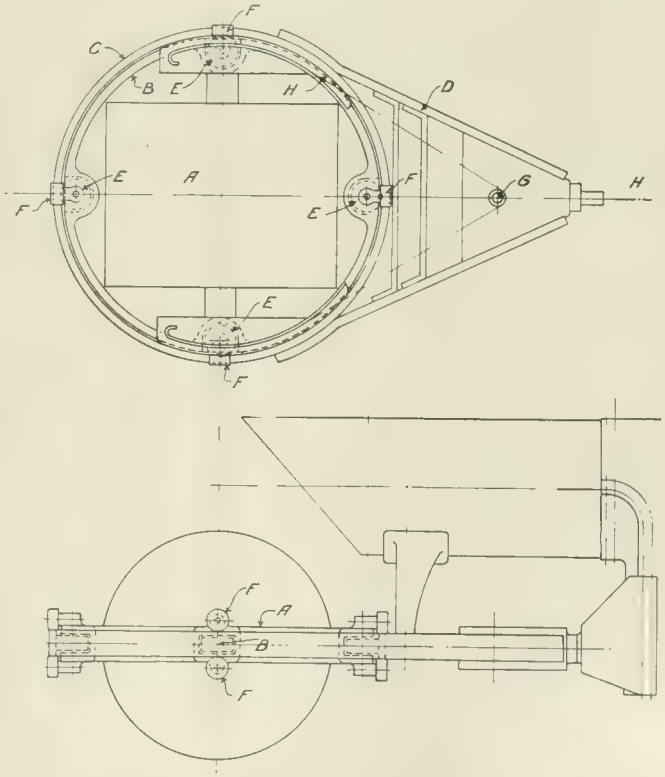

Fig. 2—Diagram Showing Front Truck Arrangement of Geiser Road Roller.

Road-Maintenance Competition.—In connection with the world's fair in Turin, Italy, in 1911, there will be held an international competition for machines and processes which shall represent improvements over systems and methods now employed for maintenance of common roads of crushed rock or gravel. Any machine for road building, maintenance or repair, or any process of road improvement may compete. About $17,000 will be awarded in prizes. Complete information concerning application to compete is furnished by the International Exposition Bureau, 41 Union Square, New York City, which officially represents the exhibition of 1911 in the United States.

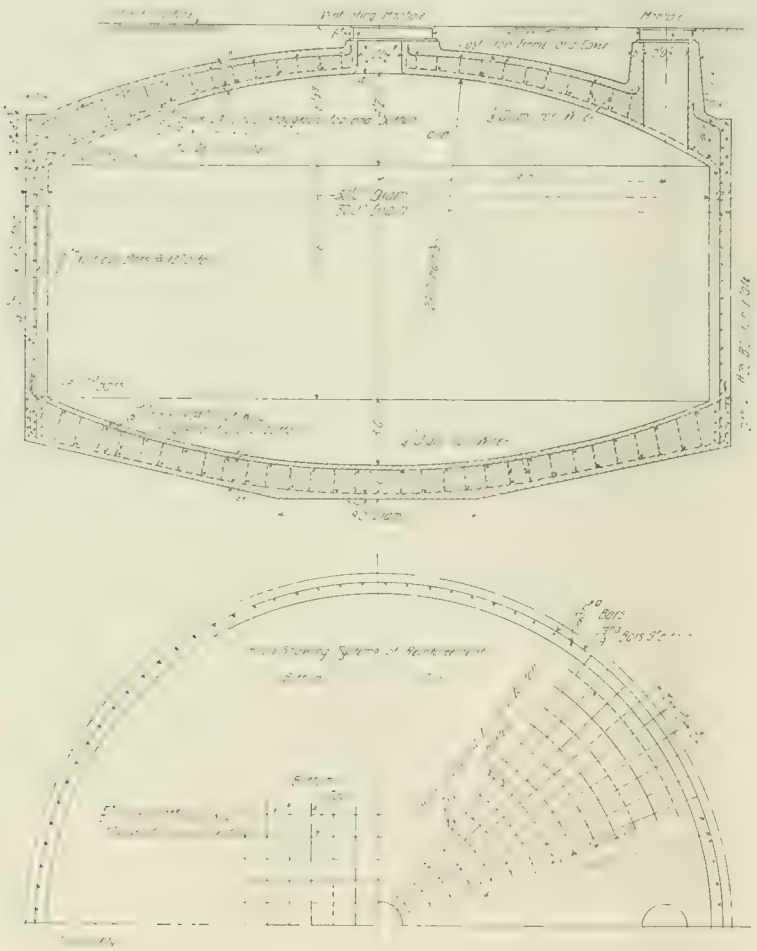
Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

Some Methods and Cost of Building Reinforced Concrete Cisterns.

BY BENJAMIN BROOKS.

The city of San Francisco has recently let the last of a series of contracts for the construction of a number of reinforced concrete cisterns to provide against future scarcity of water in time of severe earthquake. The work was divided into several contracts from 1 to 16 cisterns each, but although several contractors participated in the work, it is doubtful if any of them made money at it, for since no cost data were at hand for just this kind of job, the bids ran too low—between $4,000 and $5,000 per cistern.



Reinforced Concrete Cistern for Water Storage, San Francisco, Cal.

The cisterns were practically all alike—30 ft. in diameter, between 10 and 11 ft. high in the barrel, with domed bottom and top, and holding 75,000 gals. The top and bottom contained two layers of reinforcement, the sides one layer. Specifications called for sand of the following mesh composition:

At least 50% by weight to pass a 20-mesh screen.
Not more than 85% to pass a 50-mesh screen.
Not more than 15% to pass an 80-mesh screen.

and for rock:

⅓ between ¾ in. and 1¼ in.
⅔ between 1¼ in. and 2 in.

The mixture was 1 of cement to 5 of broken stone, with enough sand to fill the voids, which meant a 1:2½:5 or a 1:3:5 mixture, according to the run of materials and judgment of the engineers. Six pounds of some approved water-proof compound was to be mixed dry with each barrel of cement used in the sides and bottom (but not in the domes), and this necessitated at least one extra man to mix it with a hoe, measure it into boxes and pass it to the man on the mixer platform. On completion of the concrete the bottom received a regular sidewalk finish, and the sides and top a brush over with grout.

Several methods of excavation were employed. In rock or hard clay the contractor usually staged it out, two stages being sufficient for the deepest parts. In looser earth an ordinary concrete skip was used to advantage hoisted up a central tower by a donkey engine and discharged directly into wagons by a chute at 45°. In sand a bucket elevator worked very well, either chain or belt; cisterns in low, wet districts required a 4-in. motor-driven centrifugal pump to keep down the water, but a hand diaphragm pump usually sufficed, and in clay soil a bucket and a rope served the purpose. Some contractors built a pump sump outside the main excavation, but best results seemed to come by placing the sump in the middle of the excavation and leading the water to it by sub drains filled with crushed rock, the center well being formed by a large pipe which could finally be plugged below the line of the work and concreted over.

The only serious accidents that occurred as far as the writer is aware were from the collapsing or tipping over of the central towers for the hoisting skip. A man was always required on top to get the dirt out of the skip and if the tower fell he also fell, except in one instance where he had the presence of mind to slide down the chute into the wagon.

The lagging was almost universally made of 2x8-in. rough Oregon pine 20 ft. long, driven with mauls and held by circular girts made of bent car rails. The rails were in many cases too light to stand without a cross bracing of timber, but most satisfactory results were obtained with 70-lb. rails well coupled together and not otherwise braced. The original cost of these, however, was about $60 for bending plus the price of the old rails for each circle. Each cistern required from two to four circles. The contractors expected to be able to pull and redrive this lagging, but found it could not be pulled. All the contractors seemed to find great difficulty in keeping the lagging out to the proper diameter so as to give the full thickness of wall, and were obliged in some instances to draw and wedge it back plank by plank.

Forms for the side walls were usually made in three tiers, 12 or 16 sections to each tier. They were ordinary ⅞-in. T and G on 2-in. sawed ribs and were braced from a central frame or tower with 2x6-in. struts at each intersection top and bottom. Attempts to do without the central frame and to brace by polygons of 2x6 ins. around the cisterns usually resulted in the forms moving in. Dome forms were built on radial ribs of 2x16-in. stuff sawed to curve, each rib resting on a separate 3x4-in. post at the circumference and all resting on a cluster of 4x4s at the center. Over these ribs was nailed ⅞-in. T and G in about 6 pie-shaped segments. All the forms were used many times over, even being bought by one contractor from another.

The writer was employed by the city to inspect the work and keep cost data, and although he was not able to keep complete costs of any one cistern he had the advantage of obtaining them in part from several cisterns.

CISTERN A.

Located in filled ground, broken rock and clay saturated with water. Much delay on account of rain.

Excavation for First 6 Ft.—Five laborers loading by hand two 2-yd. dump wagons driven alternately by one driver to a dump 350 ft. distant on which one man did the spreading:

Item.	Per cu. yd.
Loading wagons, 1.25 man hrs. at 28c	$0.35
Teaming, .50 team hrs. at 75c	0.375
Spreading, .25 man hrs. at 28c	0.070
Total without superintendence	$0.795

Excavation for Remaining Depth.—Five to 8 laborers filling a 16 cu. ft. skip, 1 engineer hoisting, 1 laborer to dump, the bucket requiring two minutes for a round trip. One team took three buckets full in dry weather and one in very wet weather. Two men were sometimes required on the dump in very sloppy weather:

Item.	Per cu. yd.
Filling skip, 1.25 man hrs. at 28c	$0.035
Hoisting skip, .21 man hrs. at 75c	.157
Dumping skip, .20 man hrs. at 28c	.056
Teaming earth, .39 team hrs. at 75c	.292
Spreading, .23 man hrs. at 28c	.065
Total without superintendence	$0.92

This does not include the 60x5 ft. square hoisting tower built of 4x4s, which afterward fell and which cost as follows:

Item.	Per ft. height.
Man hrs. building, .48 at $.625+1.43 at $.28.	$0.70
Man hrs. rebuilding, .61 at $.625+.80 at $.28.	.60
Man hrs. dismantling, .60 at $.28	.17
Total without superintendence	$1.47

The cost of 147 pieces rough Oregon pine lagging 2x8 ins. by 20 ft. was as follows:

Heading and pointing, 0.23 man hrs. per pile at 28c = $0.06 per pile, or $2.43 per M.

Driving, 2.12 man hrs. per pile at 28c = $0.59 per pile, or $22.20 per M.

The cost of 3 rings of 70-lb. car rail rangers in 4 segments was as follows:

Man hrs. per ton placing, 17.4 at 28c, $4.87.

Forms cost as follows:

Man hrs. making per M lumber, 12.4; per sq. ft. surface, .03.

Man hrs. setting per M lumber, 47.4; per sq. ft. surface, .24.

Which at $.62½ per hour is equivalent to:

Making $7.75 per M, or $.02 per sq. ft. surface.
Setting, 29.62 per M, or $.15 per sq. ft. surface.

*572 Lombard St., San Francisco, Cal.

Reinforcing Bars.—To bend and place 1 in., ¾ in. and ⅝ in. twisted square bars required 38 man hours per ton, which at 62½ cts. = $23.75.

Concrete was mixed about 1:2½:5 in a Chicago Improved cube mixer, turning out about 7 cu. yds. per hour with a trained crew, and was wheeled and dumped in concrete "buggies." For the bottom of the cistern the man hours per yard required were:

Chutes and runways	.....
Measuring and wheeling materials	0.96
Mixing	.13
Wheeling and chuting concrete	.41
Placing and tamping	.27
Total	1.77

which at 50 cts. per hour = 88½ cts. per cu. yd.

Pumping during excavation, lagging, concreting, etc., cost as follows:

162 man hours (exclusive of night watchman), 0.27 man hours per yard of excavation at 28 cts. = 7½ cts. per cu. yd.

CISTERN B

Located in faulty serpentine rock which, though carrying much water, required little or no lagging and no drilling or shooting. Rock was staged out and conveyed in a single 2-yd. dump wagon to a dump two blocks away. The cost of excavation was as follows:

Average for the whole depth:	
Foreman days per yd. .06 at $3.00	$0.18
Team days per yd. .054 at $5 50	.30
Laborer days per yd. .442 at $2.25	.99
Pump days per yd. .05 at $2.25	.11
Total	$1.58
Average for the last 4 feet:	
Foreman days per yd. .088 at $3.00	$0.264
Team days per yd. .048 at $5.50	.264
Laborer days per yd. .674 at $2.25	1.516
Pump days per yd. .200 at $2.25	.450
Total	$2.494

The pump item is high on account of rain.

Reinforcing Bars.—Bending and placing 1 in., ¾ in. and ⅝ in. bars required 52 man hours per ton at 62½ cts. = $32.50 per ton.

Forms already made for another cistern were used and cost for placing and removing as follows:

	Per sq. ft.
Man hrs. at $.62½ placing 17.25 per M	.069
Man hrs. at $.28 placing 12.25 per M	.049
Man hrs. at $.28 removing 12.75 per M	.014

which is equal to:

Placing forms	$14.21 per M or $.057 per sq. ft.
Removing forms	3.57 per M or .014 per sq. ft.
Total	$17.78 per M or $.071 per sq. ft.

Concrete handled by same outfit and crew as for Cistern. A cost as follows:

For the bottom:	Man hrs. per yd.
Wheeling and measuring materials	1.16
Mixing materials	.17
Wheeling and chuting concrete	.45
Placing and tamping concrete	.35
Total counting delays*	2.13
Total actual running	1.80

which at $.50, $1.06 or $.90 per yd., not counting superintendence.

*Ran out of materials.

For the Walls:	Man hrs. per yd.
Wheeling and measuring materials	.82
Mixing concrete	.13
Wheeling and chuting concrete	.37
Placing and tamping	.37
Total	1.69

Which at $.50 per man hour equals $.95 per yd. exclusive of superintendence.

CISTERN C.

Located in mixed strata of sand, clay and soft rock. Work discontinued for some weeks waiting for rains to blow over.

The sheet piling having caved in out of plumb had to be drawn stave by stave for about one-third the circumference and jacked back a distance varying from 1 in. to 8 ins. This required 112 man hours at 25 cts. or, roughly speaking, 50 cts. a stave.

Reinforcing bars required 41⅓ man hours per ton to bend and place, which at 62½ cts. = $25.83.

Wall forms were already made for another cistern and required only a little patching.

Patching and placing required 44 man hours at 25 cts. plus 73 man hours at 62½ cts., which equals 4½ cts. per sq. ft., including the placing of chutes.

Removing forms and clearing cistern required 61 man hours at 25 cts. and 21 man hours at 62½ cts., which equals 2.8 cts. per sq. ft.

Concrete for the bottom and sides was mixed in a Smith mixer 2 cu. ft. of cement to the batch and run directly from mixer through portable chutes to the bottom, but wheeled in buggies to the side walls. The crew was untrained and poorly managed. The cost was as follows:

	Man hrs. per cu. yd.
Wheeling and measuring materials	1.55
Mixing materials	.30
Wheeling and chuting concrete	.42
Placing concrete	.60
Installing mixer	.74
Total	3.61

Which at 28c equals $1.01, including foreman.

Plastering bottom required 24.6 man hours at 75 cts., which gave a cost of 2 6/10 cts. per sq. ft.

Brushing the sides required 11 man hours at 25 cts., which gave a cost of 3/10 ct. per sq. ft.

CISTERN D.

Wall forms were already made and required for—

Placing (125 man hrs. at 62½c, 20 man hrs. at 25c) equals $22.46 per M, or 11 7/10c per sq. ft.

Removing (12 man hrs. at 62½c, 37 man hrs. at 25c) equals 1½c per sq. ft.

Reinforcing rods for dome required 131 man hours at 62½ cts., which gave a cost of $23.40 per ton.

Concrete for the bottom was handled as in Cistern C except that on account of a breakdown 44 cu. yds. were machine mixed and 8 cu. yds. were hand mixed, first the cement and sand dry and wet, then the grout and the rock being turned three times. For the machine mixing the costs were:

	Per cu. yd.
Wheeling and measuring materials, 1.50 man hrs. at 28c	$0.420
Mixing materials, .32 man hrs. at 28c	.089
Chuting and placing concrete, .74 man hrs. at 28c	.207
Building chutes, .55 man hrs. at 62½c	.344
Setting mixer, .34 man hrs. at 45c	.153
Total	$1.213

For the hand mixing the costs were:

	Per cu. yd.
Wheeling and measuring materials, 1.50 man hrs. at 28c	$0.42
Mixing materials, 5.12 man hrs. at 28c	1.43
Placing concrete, 1.25 man hrs. at 28c	0.35
Building chutes, 1.38 man hrs. at 45c	.62
Total	$2.82

Concrete for the walls cost as follows:

	Man hrs. per yd.
Wheeling and measuring materials	1.97
Mixing materials	.26
Wheeling and chuting concrete	.65
Placing concrete	.62
Setting mixer	.49
Total	4.00

This gives 4 hrs. × 28 cts. = $1.12 per cu. yd.

Concrete for the dome cost as follows:

	Man hrs. per yd.
Wheeling and measuring materials	1.02
Mixing materials	.23
Wheeling concrete	.47
Placing concrete	.32
*Setting mixer	1.02
Total	3.059

This gives 3,069 × 28 cts. = 80.85½ cts. per cu. yd.

Finishing the floor with ½ in. of sidewalk finish required 21 man hours at 75 cts. and 8 man hours at 25 cts. = $17.75, or 2½ cts. per sq. ft.

CISTERN E.

Located in clean, moist sand; fair weather; no pump. The excavation was done by small buckets on a rubber belt driven by an induction motor mounted on the conveyor beams so that the whole could be lowered together as the work progressed. Since the sand was valuable for construction work, the contractor had only to dump it from the elevator onto the street, where it was taken away gratis by other teams. The costs therefore are only those of getting the sand out of the excavation. They were as follows:

	Per cu. yd.
Shoveling into elevator	$0.171
Clearing sand from discharge end	0.139
	$0.310

A man hour cost 25 cts.

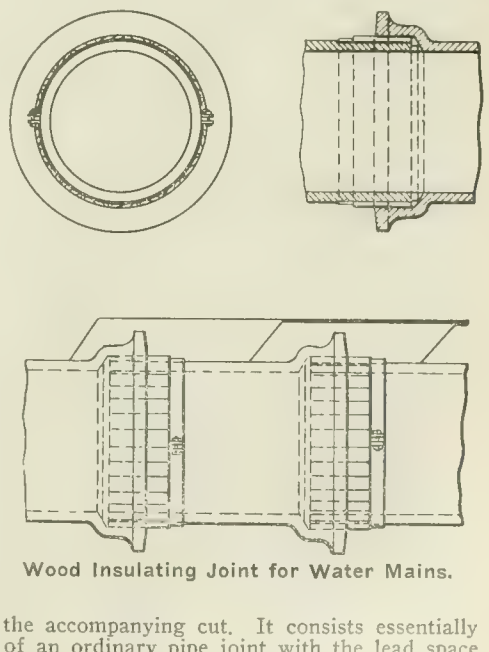
*This item seems very high, but often included carting the mixer back and forth from one cistern to another. It could have been reduced by better management.

It will readily be seen that no effort is made to account for all the costs of these cisterns, but simply to study the methods and the labor item. Costs of getting materials on the jobs are not considered nor is superintendence except in cases where it is specially mentioned.

In many cases the profits of the job were absorbed in trying to fix leaks in the concrete. This was in many cases due to hasty execution of the work, but was also largely due, in the writer's opinion, to the fact that not enough fine stuff was permitted in the concrete. In instances where the writer was able to allow the introduction of "crusher dust" running from the finest grit to gravel ⅛ in. in diameter, no leaks occurred. The costs of the several cisterns are tabulated in Table I.

Detail of Wood Insulating Joint Used in Mains of Hartford, Conn., Water-Works.

To reduce danger from electrolysis of water mains at Hartford, Conn., insulating joints have been introduced in a number of places. The construction of these joints is shown by



Wood Insulating Joint for Water Mains.

the accompanying cut. It consists essentially of an ordinary pipe joint with the lead space filled up with wooden wedges and a wooden

ring slipped inside of the bell end of pipe to keep the spigot end from "bottoming." If a sleeve is used instead of a bell end the wooden ring prevents the two pipe ends from touching inside the sleeve. A double joint of this kind is used for greater security, the two joints being made up in as small a length as convenient.

The wooden wedges are held in place by clamps around the pipe. This double insulating joint is installed by cutting out a piece of the main of the proper length and putting in the joint in place of it. A load of crushed stone is thrown in to keep moisture away from the joints as much as possible as damp earth around the joint would impair its efficiency. Three wires tapped onto each double joint as shown were brought up inside a service pipe box. Tests of these joints showed that they completely stopped the flow of current when first installed; further tests will be made this spring to determine their continued efficiency. The above information is taken from the report of Mr. H. E. Dart, assistant engineer, to the Board of Water Commissioners, Hartford, Conn.

Special Pipe Joint Used in the Baltimore, Md., High Pressure Fire System.

In constructing the new $600,000 high pressure fire system for the business district of Baltimore, Md., provision is made to supply a continuous pressure of 150 lbs. and an emergency pressure of 300 lbs. per sq. in. in the mains. All the pressure main, which varies from 24 ins. to 10 ins. with 8-in. hydrant connections, is open hearth steel lap welded pipe laid normally in 20-ft. lengths. The steel for pipe is required to show an ultimate tensile strength of 55,000-60,000 lbs., with an elastic limit of one-half the tensile strength. The thickness of shell required for the several sizes of pipe are ½ in. for the 24-in. and 7/16 in. for all smaller diameters. All pipe was coated with a composition of mineral rubber asphalt.

An interesting feature in connection with the construction of this line is the design adopted for the joints. Considerable trouble has been experienced with the effect of electrolysis upon underground pipes and in many instances the trouble has been directly traced to the pipe joint. By the use of the joint designed for this system provision is made to avoid the effect of electrolysis by making the electrical conductivity of the joint approximately equal to that of the body of the pipe. Figure 1 shows a section of this joint. The two ends of the pipes are expanded and accurately machined to the same radius as that of the separating ring. This ring which is made from the same grade of steel as that of the pipe is circular and has a cross-section as shown by the illustration. The flanges are made of medium steel, having a tensile strength a little greater than that of the steel used for the pipes, being about from 60,000 to 68,000 lbs. per sq. in. These flanges are accurately machined and the curved surface which is in contact with the pipe is made true, so that when the two adjacent pipes are deflected the contact between the pipe and the flange is fair and without strain. Preparatory to connecting these joints the rings are heated to a temperature sufficient just to melt the coating on the pipes and so secure a metal to metal contact in the joint. The ring is held in position by means of a rod screwed into a small tap hole provided at the peak of the ring, and the pipes brought together so as to bear firmly against the ring. The bolts are then put into the flanges and the final tightening of the joint is made by the tightening of these flange bolts. By this arrangement it is possible to secure a tight joint without the use of lead, gasket, cement or any other filler. Another marked advantage is its flexibility. Each joint permits a deflection of about 2 ins. for each linear foot of pipe so that by deflecting the pipe at the joint many obstructions in the ground are easily avoided.

This description has been extracted from an article by Raymond Schlegel in the *Cornell Civil Engineer* for March, 1910.

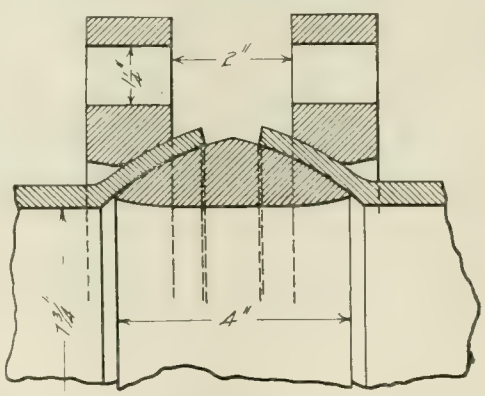
Some Costs of Construction of the Cincinnati, Ohio., Filtration Plant.*

Costs of construction of the water filtration plant at Columbus, O., were published in ENGINEERING-CONTRACTING for 1910, being taken from a paper presented by J. H. Gregory to the American Society of Civil Engineers. In discussion of this paper J. W. Ellms, Superintendent Cincinnati Filtration Plant presents comparative costs as follows:

Table I shows the costs of construction of the Cincinnati filtration plant.

TABLE I.—Total and Unit Costs of Main Features of Work Done in Construction of Water Purification Works at Cincinnati, Ohio.
(Capacity of Plant: 112,000,000 Gals. in 24 Hours.)

Work.	Total cost.	Cost per million gallons of capacity for 24 hours.
Preparation of grounds.	$ 33,359.67	$ 297.85
Pipe lines between settling reservoirs and head-house	55,354.77	494.24
Head and chemical house	144,989.85	1,267.77
Coagulation basins, gate houses and pipe lines	304,913.05	2,722.44
Filters, filter house, piping, sand and gravel	592,112.30	5,286.71
Piping, valves and gate-house between filters and clear-water reservoir	29,701.91	265.20
Clear-water reservoir	121,362.39	1,083.59
Total	$1,278,793.94	$11,417.80



Special Joint for High Pressure Fire Mains.

At Columbus, the unit costs per million gallons of capacity in 24 hours appear to be considerably greater for the settling basins and mixing tanks combined, than for the coagulation basins at Cincinnati. The figures for the Columbus tanks and basins are $7,100 per million gallons of capacity, as compared with $2,722 at Cincinnati. In a general way, these parts of the two plants correspond; but it should not be forgotten that at Columbus more elaborate baffling of tanks and basins, more divisions of the flow of the raw and treated waters, and more places for the primary and secondary applications of chemical solutions were needed and provided for, than were required at Cincinnati. The greater combined unit costs of the headhouse, lime-saturator house, storage-house, wash-water tank, offices and laboratories at Columbus, than for the corresponding head-house, chemical-house, wash-water tank, offices, and laboratories at Cincinnati, are similarly explained by the necessity for designing a plant for softening, as well as for clarifying and purifying the water. The combined unit costs for the items noted above for the Columbus plant amount to $3,784, as compared with $1,268 for the Cincinnati plant.

The filters and piping in the Cincinnati plant cost more per million gallons of capacity than did those at Columbus. The figures for Columbus, which include the air-washing equipment, are $3,540, as compared with $5,287 for Cincinnati. However, the filtered-water reservoir at Columbus cost more than that at Cincinnati. The figures for the Columbus plant are $3,280 per million gallons, and for the Cincinnati plant, $1,084. At the latter plant, the clear-water reservoir is a separate uncovered reservoir, while at Columbus, it is directly under the filter tanks, which latter form a protecting roof. Virtually, no great difference in costs exists, if the cost of the filters, piping, and clear-water reservoir of each plant be combined and then compared.

The cost per million gallons of capacity for the whole purification plant at Columbus is stated to be $17,750, which amount does not include engineering; the corresponding figure for the Cincinnati plant, as shown above, is $11,418, and this also excludes the cost of engineering. The difference of more than $6,000 per million gallons of capacity is doubtless due to the additional requirement demanded by the local conditions at Columbus, that is, for the softening of a very hard water, and one which is at times subject to rapid fluctuations in its physical characteristics.

*Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 587.

Colon Breakwater.—A general scheme for constructing the west breakwater at the north entrance to the Canal has been approved and the preparatory work will be begun this month according to the Canal Record. The purpose of the breakwater is to protect shipping in the harbor of Colon, and vessels making the north entrance to the Canal, from the violent northers that are likely to prevail from October to January, and to reduce to a minimum the amount of silt that may be washed into the dredged channel. Preliminary plans provide for two jetties of rock, one extending from Toro Point, on the west shore of the bay and ending in 48 ft. of water, and the other extending from the east shore, near Manzanillo Point, to 44 ft. contour. An opening will be left between the outer ends of the jetties through which vessels may enter the Canal and habor.

In the construction of the west jetty, approximately 3,290,000 cu. yds. of rock will be required. A deposit of limestone suitable for the core of the jetty, which may also prove suitable for the armor, has been developed on Toro Point. It is proposed to build a double trestle from the shore line from which rock will be dumped, the construction of the trestles advancing with the progress of the field. Thus as the work advances the effect of wave action on the Toro Point rock can be watched and the question as to whether harder rock will be required for the armor of the breakwater may be determined.

A dredge will be set at work taking about 50,000 cu. yds. of coral from a small bay inside the line of the breakwater, known as Shelter Cove, thus making a harbor that can be entered in any ordinary weather, and which will be more protected as the breakwater advances. A wharf will be built along the north side of this harbor, with trestle connection with the mainland, at which plant and supplies may be unloaded.

Quarters for laborers, and other employes, will be built in proximity to the work, and the camp thus established will be connected with the regular telephone system by a line six miles long. A supply of water may be obtained from the Arenal River, a small stream about a mile and a quarter from Toro Point, and at a sufficient elevation, so that the quarters may be supplied by gravity. Preparatory work will also include the clearing of land, stripping of the quarry, and the assembling of equipment. A schedule of the plant required—buildings, steam shovels, locomotives, cars, barges, and other equipment—is under consideration. Fifty steel, 19-yd. air dump cars for this work are included in the order for three hundred cars recently placed in the States, and much of the other equipment required is already on the Isthmus.

The placing of rock in the jetty will probably not begin before July 1, and the construction will proceed at a rate to insure the completion of the entire breakwater in about three years.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Representative Concrete Structures on the New York Barge Canal and Methods of Inspecting, Mixing and Handling Concrete.*

To provide for structures for different uses on the New York Barge Canal three grades of concrete are specified. First-class concrete calls for a mixture of 1 cement, 2 parts sand and 4 parts stone. The stone must be a hard trap-rock, granite or gneiss. This grade is only used in cases where an especially fine concrete is needed. Second-class concrete is a mixture of 1 cement, 2½ sand and 5 stone or gravel. By far the larger part of the concrete work is built of this grade and among the structures now being built of it are the locks, dams, bridge piers and abutments, breakwaters and retaining walls. The third-class concrete is 1 cement, 3 sand and 6 stone or gravel. This grade is not much used except in core walls and similar less important work.

Fig. 1—Dam at Vischer's Ferry, Showing Cyclopean Masonry.

STRUCTURES.

It depends on the viewpoint as to which is the most interesting class of concrete structures on the Barge Canal. Because of their large number, large dimensions and fine design and construction, the locks appeal to almost everyone. There are to be 53 lift locks. These locks have a minimum length of 328 ft. between hollow quoins; the width is 45 ft.; the lift varies from 6 to 40½ ft. This latter lift is at Little Falls and at the time of completion undoubtedly will be the highest lift of any mitered-gate lock in operation. The locks are built of second-class concrete and are constructed in sections of approximately 40 ft. in length. Each section is carefully keyed into the adjacent sections.

In constructing the locks all kinds of difficulties have been met. In some places piling is necessary to support the foundation; in other cases the locks are constructed in rock—notably so at the high lift at Little Falls, where the lock is constructed entirely in rock; and at Fulton, on the Oswego River section, the locks are constructed so close to the buildings that they almost become a unit. At Lockport the drop is so sudden that a double lift of a total 49 ft. is provided by a double lock. At Waterford five locks overcome the drop of 170 ft., which is now taken care of by 17 locks.

Adjacent to the locks are necessary approach walls, cut-off walls in earth dams forming pools, and in some cases where the locks are close together there are series of piers for forming docking to keep the barges in the channel. The estimated cost of these locks with the smaller immediately adjacent structures is $16,000,000. In addition several guard locks are to be provided at various points to prevent loss of a large amount of water in case of accident.

To canalize the rivers it will require 22 fixed dams and 14 movable dams. The fixed dams are of particular interest to those interested in concrete. They are all to be built of concrete and their construction is worthy of special consideration. For purpose of illustration the straight dam at Vischer's Ferry (Fig. 1) and the curved dam at Crescent (Fig. 2) will be taken. The dam at Vischer's Ferry is built in two river sections, these being separated by a rocky island in the middle of the river. The river sections are built on rock bottom while across the island a lighter dam connects the two with a straight crest line 700 ft. long. The concrete in the river sections is massive and it has been advantageous for the contractor to build it of cyclopean masonry. Into this second-class concrete are embedded huge stone, averaging several tons in weight. About 30,000 tons of these large blocks of stone—which were originally quarried for bridge work—were used in this masonry. The dam is built in sections of 36 ft. in length by 10 ft. high at any one time. Key-ways are built in to bind the adjacent sections. The dam has a total length of crest of 1,919 ft.; it has a lock at the southern end and head-gates at the other end. The water is raised 30 ft. by this dam.

The curved dam at Crescent also consists of two sections with a main arched dam, 1,487 ft. in length, an intervening rocky hill and a dam of smaller section across low land which will be flooded when the dam is completed. The total length of this dam, including head-gates, is 1,922 ft. Almost all the other dams have locks, but this dam does not for it marks the eastern end of the canalization of the Mohawk River. The pool back of this dam will be about 28 ft. higher than the present river level. The concrete in this dam is also cyclopean. The rocky hill, or ledge, at the site of this dam is an outcrop of a close-grained rock. The contractors have opened a quarry here and take the large stone as the basis for the cyclopean masonry. A crusher reduces the small stone to proper size for the concrete. The method of construction is similar to that used on the dam at Vischer's Ferry.

There are, of course, very interesting auxiliary structures that are necessary with the combined dams and locks, such as head-gates, guard-gates, retaining walls, core walls into abutting territory and dikes. In addition to the dams necessary for the direct operation of the canal, there are two large storage reservoirs which also require large dams.

The Barge Canal calls for the erection of many bridges but these we will not consider except as to the part concrete may play in their construction. The abutments and piers are, of course, to be made of concrete. The floor system of most of the bridges are to be of re-inforced concrete construction. The walks on the bridges are concrete. The interesting feature of the application of concrete to the bridges has been the new and original type of abutments and approaches (Fig. 3), which have been adopted for the highway bridges. An illustration quickly tells the story that these abutments and approaches are constructed of piers of re-enforced beams and floor slabs. The forward piers are of plain concrete and are built upon a concrete base or wall approximately 25 ft. long by 6

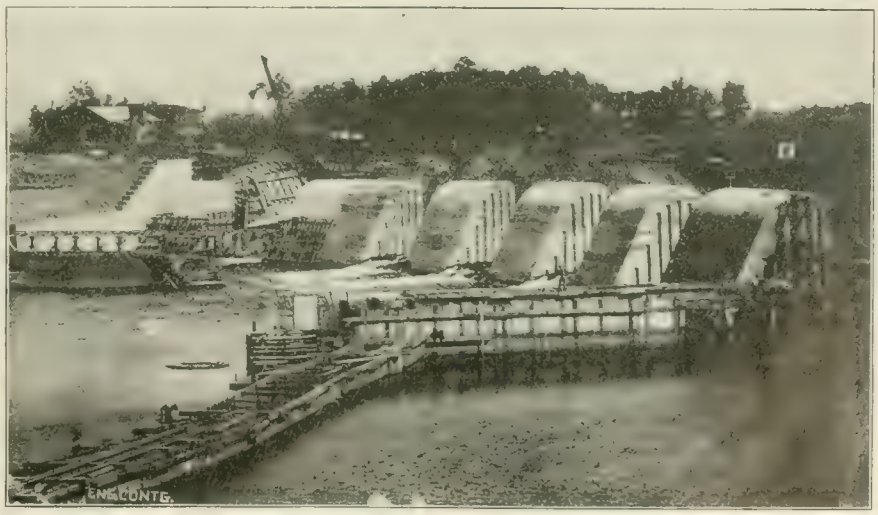


Fig. 2—Curved Dam at Crescent, Alternate Sections.

*Condensed and rearranged from a paper by Russel S. Greenman, read at the 1910 Convention of the National Association of Cement Users.

ft. wide and 6 ft. high. These piers carry the highway bridge as well as the short concrete span. The rear piers are made of 24-in. square reinforced concrete columns. By this construction a large amount of concrete is saved over the older form of solid abutment and wing walls. Also a large amount of embankment is saved by this method. The fill is protected by a stone paving on a slope of 1 to 1. It is calculated that, notwithstanding the larger cost of the reinforced concrete over

Fig. 3—Approach to Highway Bridge at Sylvan Beach, Reinforced Pier and Slab Construction.

plain concrete, a saving of $500 is made per single bridge approach span and abutment.

Reference has been made several times to some of the smaller structures. A special statement concerning each of these is hardly necessary as the design and construction is generally characteristic of similar structures on other works. It might be well, however, to call attention to the great saving of concrete that is made on high retaining walls by having recesses in the face of the wall. The same strength is obtained as though the wall were built of solid concrete, but quite a saving is made on cost. The breakwaters on Oneida Lake (Fig. 4) and dikes on river sections are also interesting pieces of work.

INSPECTION OF MATERIALS.

For the construction of the vast amount of masonry it was, of course, necessary to provide the best inspection of materials and workmanship. All materials proposed for use in the making of the concrete are carefully examined and tested and experienced men are placed as inspectors on the structures while being built.

As in all other large projects careful attention is given to the cement proposed for use. The engineer in charge of tests made visits to many of the leading laboratories and selected the best ideas in use in these. The laboratory was enlarged and thoroughly equipped with the very best apparatus for the testing of cement. Carefully trained testers follow the standard methods and make all standard tests. These consist of tests for setting, fineness, constancy of volume, tensile strength and specific gravity. Chemical examination is also made.

It was originally planned that the tests should be made on cement that was delivered in the storehouse on the work. The samples were taken from the stored cement and sent to the laboratory at Albany for the required tests. Tests were started as soon as the samples were received and the results were promptly given but, at best, 10 to 12 days elapsed from the time the samples were taken, shipped by express into the laboratory, given a 7-day test and reported to the engineer in charge of the contract. A contractor using large quantities of cement therefore had to have a large cement storehouse in order always to have accepted cement ready for use. Gradually a system of mill inspection of cement has developed. When a contractor places with a cement company an order for cement that is large enough to warrant stationing an inspector at the mill, an inspector is directed to sample one or more bins of cement—depending on the size of the bins. These bins are sealed with a seal of the Department of the State Engineer and Surveyor. The samples are forwarded by express to the testing laboratory at Albany and immediately tested. If the cement meets the requirements of the specifications it is accepted and held subject to the order of the contractor. Whenever this contractor wishes shipments made to the work, the inspector breaks the seal on the bin, inspects the loading of the car, or cars, seals each with the department seal, re-seals the bin and notifies the resident engineer in charge of the laboratory and the resident engineer in charge of the contract, of the shipment. When the cars arrive at the place of work, the seal must be intact and must be broken open only by the engineers on the contract. By this method only accepted cement is delivered on the work; and if he cares to do so, the contractor can use it immediately upon its arrival. The shipments from the mills have gradually increased until, on Oct. 25, 1909, a high-water mark of 31 car loads, or 5,150 bbls. of accepted cement was inspected by this department for the Barge Canal. The daily average for the week was 2,911 barrels. The amount of cement shipped is used as an indication of the amount of structural work being done by the contractors.

In the selection of aggregates for his concrete the contractor is first guided by the classification of his concrete and then he naturally wishes to use that material which he can secure most cheaply and still keep within his contract. However, in order to insure good concrete, proper sand and stone, as well as cement, must be used. The State therefore demands that the sand or screenings, and the stone or gravel, shall be approved by the Department of the State Engineer and Surveyor. Samples of these are sent to the testing laboratory and carefully examined and tested. The sand is examined under the microscope as to the character of its grains; it is passed through a nest of sieves to secure the grading and sizes of the sand grains; and both in the natural condition and washed, it is tested with cement for strength; and also tested for percentage of loam and voids.

If there is no good sand or gravel within economical hauling distance from the work, the contractor must necessarily import such material. In one notable instance, however, the contractors found that it would be more economical to wash and screen the gravel. They erected a plant (Fig. 5) at a cost of $90,000, and it is probably the largest temporary washing and screening plant ever erected. The capacity of the plant is 200 cu. yds. of gravel per hour.

In some cases where a desirable sand cannot be easily obtained, crushed stone screenings are used in place of the sand. It is required that these screenings shall be crushed from a hard, durable stone and that the particles shall be well graded. An excess of fine dust or powder must be screened out.

The crushed stone, proposed for use, must be from an approved kind and quality of rock—free from dirt and organic matter. In second-class and third-class concrete, gravel which is composed of hard and durable stones may be substituted for crushed stone. Either stone or gravel must be examined for the percentage of voids and the proportion of matrix may be varied so that there shall be an excess of 20 per cent of matrix over the natural voids of the loose aggregate.

In the structures where the concrete is massive cyclopean concrete is permitted and in many cases the contractors are building this kind of concrete. The specifications permit in massive concrete of the second or third class, where the section is not less than 4 ft., the placing of boulders and fragments of rock containing more than 1 cu. ft. These must be made free from all dirt and must be placed on their largest bed. They must be kept at least 6 ins. apart and none shall be within 2 ft. from the surface. The contractors who have taken advantage of this permit to make cyclopean concrete have, as a rule, used only very large stone in such massive structures as are some of the dams.

In connection with routine testing and inspection of materials frequent tests are made along special lines. Many of these have been made on the use of salt during freezing weather, amount of loam that is permissible, addition of collodial clay in order to produce impervious mixtures, the substitution of crushed stone screenings or iron-ore tailings in place of sand, the use of various waterproofing compounds and the various methods of surface finishing.

METHODS OF MIXING AND PLACING CONCRETE.

The large contracts under which the work on the Barge Canal is done make possible, and even necessary, large plants. As has been suggested, there have been many ways tried of doing this large work. In the manner of mixing and placing concrete the usual variation exists and also there is the large plants for the work.

The specifications demand that in all work where more than 200 cu. yds. of concrete is to be placed, the mixing shall be done by machines. Batch mixers only can be used and of these very many kinds are in use. Those most generally used are the cylindrical, or cubical, drum and the Haines mixer. The latter has been used both in a stationary position and as a movable mixer—being carried by a derrick from the place of loading to the place of depositing the concrete.

Fig. 4—Breakwater on Oneida Lake.

The mixing plants are sometimes stationed directly in the newly excavated canal channel and the materials are hauled over trestles and emptied into hoppers over the mixers. Most plants, are, however, placed at some point conveniently located near to rail or water service, and then the materials are transferred after being mixed. Some have the mixers on cars or movable platforms and empty the mixture directly from the machine into the forms.

In transferring the mixture from the mixer to the forms, when the two are much separated, various methods are used. The most popular method is the common bucket and car arrangement while others have preferred to transfer the buckets by cables. In one case, however, a belt conveyor system (Fig. 6) has been used. Because of the amount of concrete

Fig. 5—Sand and Gravel Washing and Screening Plant.

handled by this system, special consideration can well be given to it. Within a radius of one mile from Lock No. 4, several massive concrete structures—aggregating 250,000 cu. yds. of concrete—are planned to be constructed. Between two massive locks which, with the adjacent structures, would need about 100,000 cu. yds. of concrete, the first part of this plant was built. A capacity of 500 cu. yds. per working day of 8 hours was planned. The maximum output has been 450 cu. yds., or practically 1 cu. yd. per minute. To handle this quantity of material the plan, briefly described, is as follows: The sand and stone are dumped into separate hoppers over belt conveyors and carried by them to bins over the Haines mixer. When the bins are filled the sand or stone automatically passes through a chute into storage bins. The cement storehouse has a capacity of 10,000 bbls. of cement. Through the center of this passes a belt conveyor which carries the bags of cement up to the mixer. A great saving of labor in the handling of these raw materials is accomplished by this system as the only labor is the shoveling the sand or stone from the end of the car to the center and the placing of the bags of cement onto the conveyor. The concrete mixture is then carried by belt to the locks on three series of belts moving at the rate of about 450 ft. per minute—each succeeding belt moving a little faster than the previous one so that there will be a better division of the material that comes from the mixer. At the locks there was a large tripper car with a boom 45 ft. long. The concrete is tripped from the main belt to the boom belt. The boom would swing over an angle of 200° and would reach either side of the lock. In carrying the concrete on the belt a mixture, somewhat drier than desired, had to be used. To produce the proper consistency water was piped to the end of the boom and added to the mixture as needed. As it left the boom belt the concrete was collected into a narrow space by means of spouts. These were hung so as to swing freely and the concrete could be deposited at any point as desired. The lock walls were, as a rule, built in 40 ft. sections with the forms providing for a depth of concrete of 6 ft.

The plan just described was altered somewhat on one of the locks by doing away with the trestle in the center of the lock and building a light steel skeleton right on the site of the side of the lock. On this the belt was run and as the concrete reached the top of the skeleton a new section was built on top of the old and the old became an integral part of the lock—a reinforcement, as it were. It is claimed for the belt conveyor that it has decided advantages over a bucket and car method as it keeps the particles together and prevents the separation often occurring with the other methods. The whole mixing and conveying plant, just described, is operated by electric power.

There are definite rules and requirements for the proper placing of concrete into the forms. Care must be taken that the concrete shall be in place before the cement shall have taken an initial set, that it shall be put in place in layers so that it will make a dense and impervious monolith, and that newly laid concrete shall be protected against freezing when placed in during the cold months.

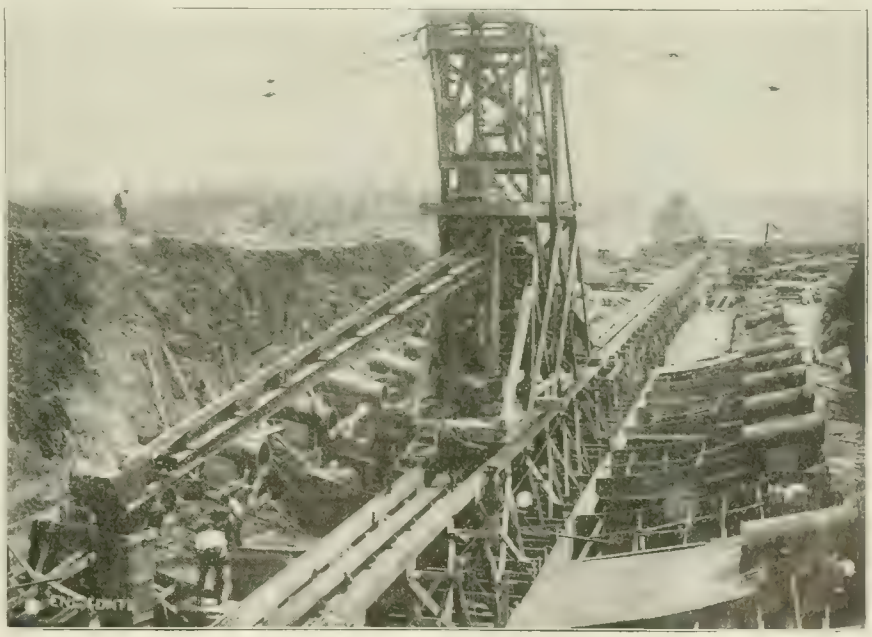

Fig. 6—Belt Conveyor System, Mixing and Conveying Concrete.

A project is under consideration for the development of 30,000 hp. on the east branch of the Kennebec River in Maine. S. W. Philbrick, Skowhegan, Me., is interested.

Protection of Cross-Ties from Mechaniacl Wear by Means of Plugs, Screw Spikes and Tie Plates with Estimates of Costs and Savings.*

It is a common practice in Europe to provide in cross-ties a wooden screw plug or dowel to receive the spike. The ties are bored with holes about 5½ ins. long and 1½ ins. in diameter. These holes are then threaded to about 1 in. The ties are then treated, usually with creosote, and the wood around the hole intended for the plugs is thoroughly impregnated. The plugs or dowels are also impregnated with creosote and are screwed home in the holes prepared for them, the tie is then sized and the tops of the plugs are smoothly cut off in the same operation. The number of spikes varies from two to four at each rail bearing.

The question may be asked, of what use are the plugs? In the first place, the boring of the tie previous to treatment makes it practicable thoroughly to impregnate it with a preservative against decay at the points where it is most vulnerable, namely, where the spikes are inserted, and where the wearing action of the tie plates and the rails occur. But there is another very good reason which will be shown by the table, giving the results of tests made for the purpose of determining the resisting power of various kinds of spikes against withdrawal under various circumstances, as follows:

	Mean. Lbs.	Maximum. Lbs.
Square spike in unbored tie	4,558	6,826
Round spike in unbored tie	2,478	6,066
Square spike in bored tie	4,082	5,810
Round spike in bored tie	4,108	6,940
Screw spike in bored tie	6,916	10,842
Screw spike in oak plug	8,170	9,724

Of course, the resistance of the driven spike as compared with the screw spike is very much greater, according to this table, than it would be after it had been used for a little while. After they are once loosened their power of resistance against an upward force is much less. It will be observed that the resistance of the screw spike against withdrawal is much greater than of the others.

A series of tests were also made to determine the comparative crushing strength of ties with and without a certain number of plugs. The conclusion reached as a result of these experiments is that the plug acts as a column, transmitting by means of its threads the pres-

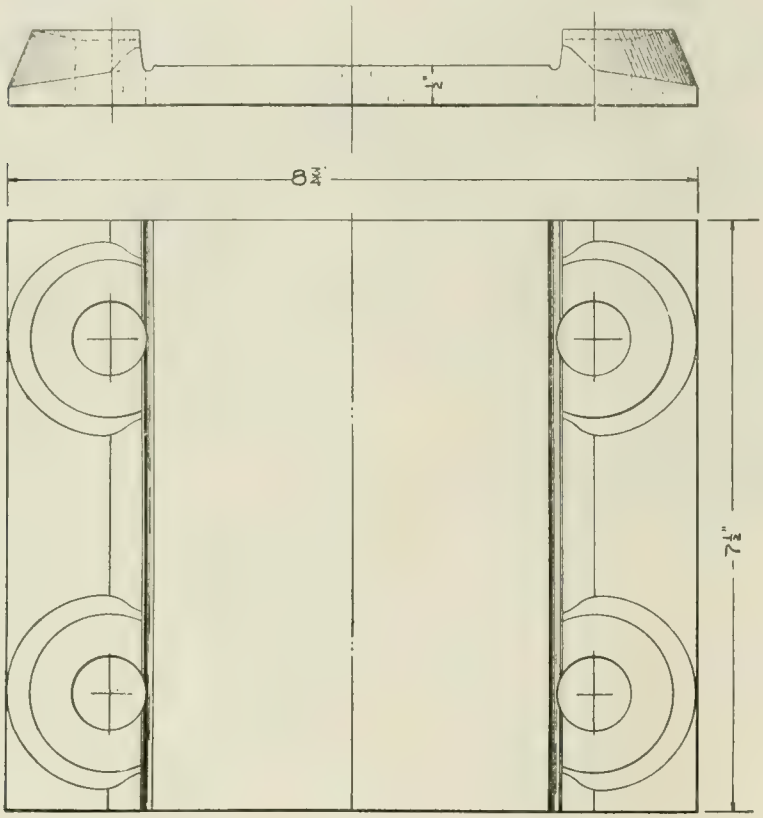
*Extracts from a paper by J. W. Kendrick, read before the American Railway Engineering and Maintenance of Way Association, March 15, 1910.

sure to which it is subjected from top to bottom instead of being concentrated upon the top layer.

If ties serve their purpose for upwards of 25 years on European roads and are afterwards useful, as is the case, for fence posts and other purposes, there is no good reason why approximately the same longevity should not be obtained in American practice. In order to secure this result it is necessary first to treat the ties with some preservative to prevent decay. In doing this first cost is of comparatively minor importance. The best proven treatment should be used, and there is no doubt that creosoting satisfies this requirement better than any other method. Ties may be fully creosoted; i. e., impregnated with all the creosote that the wood will take. They may be impregnated by the Rueping process, in which a portion of the creosote is extracted by exudation resulting from the expansion of the air forced into the wood cells during the process of treatment and by the after application of a vacuum. They may be treated by a mixture of zinc chloride and creosote, or by any other method that is of value. Proof of the value of a method of preservation does not depend upon actual use of the ties in track. The growth of the fungus that produces decay can be stimulated, and results can be obtained in a few months that would require years of actual service to develop.

The Atchison, Topeka & Santa Fe Ry. has adopted the Rueping process for the treatment of ties at its plant in Somerville, Tex., which has a capacity of about 2,500,000 ties annually. It uses crude oil with an asphaltum base at its plant in Aubuquerque, N. M., which has a capacity of about 750,000 ties annually. The oil treatment is considered experimental, and its adoption was based upon the results obtained in its experimental track on the Beaumont division in southeastern Texas, where ties treated in this way were perfectly sound after a period of 5 years, and are still in that condition after the expiration of 7 years from the time of their insertion. Untreated ties made of the same wood placed in this track decayed within 9 months. The Reuping process is rapidly taking the place of the full creosote treatment, which has been followed for years in Europe.

Second, tie plates of adequate length, width and thickness should be used in order to properly distribute the maximum pressures transmitted through the base of the rails to the upper surface of the ties. The properties of various kinds of wood, with respect to their ability to resist compressive strains, have been determined repeatedly. As the majority of the ties that will be used in the future will, as at present, be made of the soft and inferior varieties of wood, it is desirable to reduce the pressure upon the fiber to about 700 lbs. per sq. in. The maximum weight on a single engine driving wheel is about 30,000 lbs. It will probably be sufficient if we add 50 per cent to this to represent the effect of a suddenly applied load; in other words, to provide for the effect of impact. The rails and tie plates being securely fastened to the ties by screw spikes, the transmission of the effect due to the load on any wheel will be much more uniform than when cut spikes are used, in accordance with prevailing practice.



Tie Plate.

The accompanying cut of a tie plate shows one which has been adopted, among others, by the A., T. & S. F. Ry. This plate is 8¾x7½ ins., and is ½ in. in thickness. The effective area is therefore about 63 sq. ins., and the pressure on the tie incident to a load of 45,000 lbs. is just 700 lbs. per sq. in. The thickness (½ in.) has been found sufficient as a result of service under the heaviest power during a period of more than two years. It may be said that the width of this tie plate, 7½ ins., will require a change in the specifications, but in the interests of economy this change should be made. Narrower ties cannot be protected from wear, and consequently it will be unwise to go to the expense of treating them with preservatives. This plate is designed to support the head of the spike in its entirety, and this is very necessary for the purpose of securing satisfactory results.

Third, screw spikes should be so designed as to facilitate driving without injuring the shank. Where spikes are driven by hand this is not so important, but the only reason for tapering the head is the fancied advantage in forging the spike. It is practicable to forge them with cubical heads, and these are preferable. It is impracticable to apply screw spikes by hand in this country, without unnecessary expense, on account of the high wages that must be paid for labor, and the application of a machine driven tool to a truncated pyramidal head has been found to be difficult on account of the tendency of the tool to engage, then slip, so rounding the head as to impair its value for the purpose for which it is intended.

Fourth, it is desirable to introduce wooden screw dowels or plugs bored in the center to receive the screw spikes. The tie should be bored and threaded to receive these plugs at the treating plant, and before treatment, as impregnation by the preservative generally will be very much more thorough than if these holes are prepared after treatment. This method of procedure is considered very important because it is impossible to secure the impregnation of heartwood by any preservative, at least to any great extent, and if the tie is treated first and bored afterwards, the portion which is unimpregnated will be opened for the admission of moisture and fungi spores, which cause delay. The plugs or dowels should also be impregnated before they are inserted. The bearing surface of the ties should be sized and the plugs cut off at the same operation, to receive the tie plates, and thus insure proper and uniform bearing.

The question will naturally be asked as to the relative cost of adopting this form of construction as compared with that now in use. A proper machine at the treating plant will bore and plug 600 ties with 8 plugs each per day of 10 hours, at a cost of 3½ cts. per tie. The cost of making the plugs will be about 1½ cts. each. The cost of screw spikes will be 2.7 cts. each, of tie plates 21 cts. each. The cost of cut spikes will be 1.06 cts. each. Assuming 3,000 ties per mile of track, with 4 spikes per tie, that the same types of tie plates are used both with screw spikes, and that no dowels are provided for cut spikes, the relative cost per mile of track would be as follows:

One Mile of Track With Screw Spikes and Dowels.	
12,000 spikes at 2.7 cts. each	$ 324
6,000 tie plates at 21 cts. each	1,260
Boring ties for, and driving, 24,000 dowels, at 1 ct. each	240
24,000 wooden dowels at 1½ cts. each	360
Driving screw spikes (per mile)	150
Total	$2.334
One Mile With Cut Spikes.	
12,000 spikes	$ 127
6,000 tieplates at 21 cts. each	1,260
Driving cut spikes (per mile)	150
Total	$1,537

The difference in cost is considerable. The calculation assumes that tie plates will be used in either case, and true economy requires that this be done. The estimated cost of driving screw spikes is based upon work actually done under unfavorable conditions on a section of track about 5 miles in length on the Illinois division of this railway last fall. Unfortunately, the holes in the tie plates were a little too small, so that the screws acted as reamers to enlarge the holes before they could be driven home. The record of cost for driving 4,200 track feet—the best progress made in one day—indicated that there would be little or no difference between the cost of applying screw spikes and of driving cut spikes.

The element of increased cost is one which enters into any construction of superior type, and the real question is, Is it worth while? If this process is followed, the average life of the ties on American railways would, very conservatively speaking, be 21 years instead of about 7; that is, they would last three times as long as at present. Screw spikes should be applied as ties are renewed. Then at the end of a period of from 7 to 10 years any line of railroad pursuing this course would have provided its track with treated ties, screw spikes and so forth. Let us consider what this would mean if the railroad mileage of the United States were reconstructed in these respects:

Present (1910) trackage U. S. steam railroads .....350 miles
At present in track, about.....1,000 million ties
Present annual requirements....150 million ties
Average trackage added per year for past 7 years.....10,000 miles
Requiring yearly for new track..30 million ties
Present average life of ties.....7 years
Requirements, assuming annual increase in trackage, of 10,000 miles, for next 21 years.....4,000 million ties
Corresponding to over 200 billion board feet timber or 1-12th of our present standing forest.
Cost for 21 years with cut spikes:

Present cost per tie, including treatment, tie plates, spikes, etc.	$1.00 to $1.15
At present rate of increase in timber prices, cost as above, in 1931.	$1.75 to $2.00
Average cost during next 21 years, approximately	$1.55
Total investment in ties, present practice, to 1931	$5,500,000,000
Cost for 21 years, with screw spikes:	
Present cost per tie, average only 20 cents more than for cut spikes.	
Average present cost	$1.35
Average cost during next 21 years, if all renewal and new construction is made with screw spikes, approximately	$1.65
Tie requirements to 1931	less than 1,600 million ties
Cost of same	$3,500,000,000
Saving from use of screw spikes	$2,000,000,000

These figures are sufficiently large to command respectful attention. They will be proportionately correct for any mileage that may comprise any system or any mileage that may be assumed. They may err in gross because of the impossibility of determining the relative number of ties used in main lines, which should be so treated, and in yards, where such treatment would not be generally followed. With the national timber supply only sufficient to last 30 years, with the certainty that the cost of ties will increase more rapidly in the future than it has in the past, with the necessity for conserving the timber supply of the country in the interests of economy, and in order that timber may be obtainable for purposes for which no other materials are suitable, there can be no question that the time has come when this very important problem should receive the serious attention of every one having to do with maintenance of track. The saving that can be effected will represent an addition to the net earnings of the railroads of the country. The total saving indicated by the above statements amounts to 4 per cent upon the enormous sum of fifty billions of dollars.

Other important savings in connection with this method are those incident to the reduction in the enormous cost of transporting the great number of ties that are now required as compared with the lesser number that will be required if the sensible and more economical practice of European countries is followed. The average haul of crossties in 1905 being 500 miles, assuming the actual cost of transportation to the railroads to be 3 mills, the cost per tie transported was about 8 cts. and the cost of transporting the ties used annually, an average of 200,000,000 for the next 21 years, would amount to $16,000,000 per year. If the life of the tie be increased three-fold, the cost of the transportation will be decreased almost to one-third of this amount, or to $6,400,000 per year, and the difference between these two costs represents an annual saving to the railroads of the United States of $9,600,000 or about $200,000,000 for the period.

Again, a common estimate of the cost of inserting a new tie is 15 cts. This includes all the operations necessary for removing the old tie, inserting a new one, and restoring the ballast. Applying the cost of 15 cts. to the number of ties annually used results in showing a cost to the railroads of the nation for removing old ones of $30,000,000 annually, whereas, if the foregoing arguments are correct, this amount could be reduced to $12,000,000, and really the saving of $18,000,000 per year or $378,000,000 for the period of 21 years, constituting the difference between these two sums does not represent the entire saving because the reballasting or resurfacing is not completed at the time of the tie insertion, but in the aggregate vast indeterminate sums of money must be spent to restore the track to standard condition, subsequent to tie removals. These conditions do not take into consideration the cost of providing the enormous number of cars and locomotives required for the transportation of ties or a fair compensation to the railroads for the use of such equipment. If they are not required for this purpose, it will either be possible to get along with less equipment or to use them for the transportation of revenue business.

The above computations, which show the apparent saving due to the adoption of a more rational and thorough system of track construction, do not take into account any interest charges which will properly accrue in connection with that portion of expenditures for ties used in construction, which are paid for with the proceeds from the sale of bonds. The interest alone would amount to another indeterminate sum, according to the rate per cent, whether applied to the whole investment or only to that part in new track, whether compounded, etc. In any case it would run into the hundreds of millions.

It may be ventured that some substitute will be found for wooden ties. If the figures representing the average cost of ties during a period of 21 years are correct—and that cost is $1.55—there is very little probability that steel ties can be economically used. In the first place, they are not successfully used anywhere. Perhaps this statement is a little too positive, yet the testimony of American engineers who have investigated the subject abroad is to the effect that the men actually having to do with maintenance of track, even those who have had the longest experience with various types of steel ties, have very little to say in their favor. It must be remembered, too, that the cost of steel is destined to increase, not in the same ratio as the cost of timber perhaps—still it must increase appreciably. It is believed at the present time that all of the large existing bodies of ore have been located and approximately defined. If this is true, the exhaustion of these measures will be similar to that which must take place in our forest supplies. The coal measures of the United States and the tonnage that can be extracted therefrom can be computed at the present time with comparative accuracy. Without doubt the cost of coal must increase, and if it is also true, of which there can be no doubt, that the consumption of steel will increase enormously, its cost is bound to be higher. Of course, a satisfactory steel tie will be found, but the writer believes that it will be a combination tie made of steel and wood. If so, the problems of tie preservation and protection against mechanical wear will be similar to those which must be considered in connection with ties made entirely of wood.

A Collapsible Steel Horse or Trestle.

The steel horse shown by the accompanying illustration is adapted to all the uses to which the ordinary modern horse is put and is besides quite as light and far more convenient to handle and store. The latter advantages is due to the fact that the legs can be folded under and close up against the body of the horse. As will be seen the construction is of angles and butts with good stiff connections between legs and body. In the matter of strength this horse is claimed size for size to be superior to any other form. It is made in various sizes by the S. M. Hildreth Co., 2 Rector St., New York, N. Y.

Collapsible Steel Horse.

Specifications for Erection of Railroad Bridges.*

There is not much uniformity in the practice of railroad companies concerning the manner in which they manage the erection of bridges. Some companies whose bridges are of ordinary character and dimensions erect them with their own forces, others contract for the erection, others again erect the small bridges with their own forces and contract for the larger bridges.

The erection of a bridge, whether done by the railroad company's forces or by a contractor or by a combination of the two, embraces the use of erection plant, materials and labor required for performing a number of items of work. When done by the company's forces, the company furnishes all materials and plant and the separate items are distributed among the gangs properly equipped for the different characters of work, and no question arises as to what is included in the erection. When done by contract, the railroad companies in some instances construct spur tracks, unload and store materials, furnish free transportation and engine or work train service, flagmen and falsework, maintain traffic, frame and place ties; other campanies furnish none of these items.

It is necessary to construct spur tracks for the convenient handling of materials only when the structure is of some magnitude and is at a considerable distance from the nearest siding; or when the traffic is so heavy as to require erection with the least possible interference, in which case it is usually erected on the outside and pulled into position. While the construction of spur tracks is at times a necessary part of the erection, the railroad company's forces are better equipped for such work than are the contractor's, and it is therefore advisable, in all cases where such spur tracks are necessary, for the company to construct them with its own forces.

Cars can not always be permitted to remain for any considerable length of time on sidings. They should therefore be promptly unloaded and, if the material for the superstructure has been delivered in advance of the completion of the masonry, or when it is not expedient to start the erection immediately after the delivery of the material, the material should be unloaded and the cars released by the company's forces. It cannot be expected that the contractors will ship plant and men to unload the cars and then either wait until the masonry is finished or else move their forces away.

The materials used in the erection of a bridge are usually shipped to the nearest, unless a spur track has been constructed at the site. This siding may be quite a distance from the bridge site and will in that case require engine and work train service in order to get materials within handling distance of the erector's outfit. It is properly up to the railroad company, therefore, to furnish such service when required. It is optional with them whether they furnish all such service free of charge to the contractor, free for a limited number of days, or charge for every day's service furnished. Whether the work is done by the railroad company's forces or by contract, there will be expense to the railroad company, and it should be charged to the bridge.

When all such service is furnished free of cost, there is a possibility of abuse and calling for engines and work trains more than is necessary for the work. When each day's service is charged against the work, such service will be called for only when absolutely necessary, but in all cases of work train service there is involved more or less delay in furnishing the service on account of keeping the main tracks open for regular

*A paper by J. C. Greiner forming part of report of Committee in Iron and Steel Structures, American Railway Engineering and Maintenance of Way Association.

traffic service, and it frequently happens that but one or two hours' actual service is obtained during the day. A contractor cannot well include the cost of such interrupted service in his estimate, and thinks he has good cause for complaint when he is delayed and charged fully.

In order to avoid the abuse of engine service by contractors, a number of railroads furnish such service free of cost for a limited number of days, according to the judgment of the engineer, and charge the contractors regular service rate for all time in excess of that named. The writer thinks this will meet the conditions better than furnishing unlimited service free, or charging for all service, as it will have a tendency to make the contractor not call for service except when necessary, and when rendered will cause him to use it to the best advantage.

Practice also varies as to the transportation furnished by railroad companies to contractors. Some companies furnish no transportation whatever for men or materials, others will transport free over their lines the contractor's equipment, materials and men. This is therefore optional with the railroad, but as it involves a question of considerable expense, the contractor doing the work should know in advance whether or not he is to have free transportation. When such transportation is furnished by the railroad company, it is usually with certain restrictions as to trains and time.

While erection is in progress, flagmen must be stationed each way from the bridge in order to protect the trains and the work. These men should be familiar with train movements and should preferably be employes of the railroad company and under the company's complete control. Some roads furnish such flagmen and charge their wages to the contractors. The contractors understand this in advance, and add the cost of such labor to their contract price. Therefore, it makes no difference so far as the cost of the work is concerned whether the railroad company furnishes these flagmen free of cost or charges their time to the contractors, provided the contractors know in advance who is to pay the bill.

It is not necessary for a structure intended for temporary use to be designed with the same degree of strength and excellence that would be required should the structure be intended for permanent use. It, of course, must be of ample strength for the purpose and sufficiently substantial to prevent excessive motion. In designing such structures, therefore, it is proper to take into consideration their temporary use, that traffic, if any, will be operated at slow speed and that the structures are under constant supervision until finally removed. Materials must be suitable for the purpose, although they need not necessarily be new nor inspected with such refinement as would be applied to a structure that was to remain in service eight or ten years. It is well to properly proportion all parts for the maximum loads which will come upon them while in service, but it is not necessary to apply in these designs the unit stresses recommended for permanent regular service conditions. We all know that the unit stresses recommended by committees of this Association for timber trestles are safely exceeded time and again in regular practice. It would, therefore, be an unnecessary expense to use these low unit stresses in purely temporary structures used during the erection of a bridge.

Specifications for erection do not usually specify the permissible unit stresses, this matter being left either to the judgment of the erector or to the engineer who plans the work. It is advisable to fix a limit to these stresses and with suitable materials this limit could reasonably be placed 50 per cent in excess of limits recommended by Committee VII., as given in the Manual of Recommended Practice (1907).

In the construction of such falsework, there can be no reasonable objection to the use of round timbers instead of square timbers for the legs of bents, provided such timbers are of sufficient dimensions as not to exceed permissible stresses, and provided they are sawed off square to the axis of the stick.

When there is temporary falsework under an old bridge, placed by the railroad company for the purpose of supporting it until it can be renewed, the contractor who erects the new bridge should be permitted to use any part of this falsework during the construction of the new bridge, provided, of course, it is not wasted in cutting.

Some railroad engineers, even when they contract for the erection of a bridge, prefer to build the supporting structure for maintaining traffic, the contractor building only such additional temporary structures as may be necessary for the handling of the work. Frequently these temporary structures, whose only purpose is to maintain traffic, are constructed without any consideration whatever as to the requirements during erection, with the result that they have to be altered, cut down, or lengthened out before erection can proceed. If the railroad companies insist upon doing this work with their own forces, the contractor's men will work at a disadvantage or lounge about waiting for the railroad companies' forces to finish. From the writer's observation, he is not at all convinced that the railroad companies' forces are able to maintain traffic on falsework any safer or better than is done by the contractors' forces under efficient supervision, and, aside from this, when the two forces work on the same job at the same time, there is bound to be more or less interference and friction.

If the railroad companies build the temporary structure for carrying the traffic, the contractor is relieved of that responsibility, which means that the railroad company should always keep a force of men there to make the changes as the work progresses. In case the erection of a bridge is contracted for, it is evidently better to have the erector build the temporary structure for maintaining the traffic as well as that for erection purposes solely, in which case he is the responsible party, and on proper supervision by the railroad company the work will be just as well done and interference of forces will be avoided.

When, however, railroads insist upon maintaining the traffic with their own forces, the falsework should be placed so that it can be used for erection purposes as well as for maintenance purposes, and in such a manner as to interfere as little as possible with the work of the contractor.

Committee XV. has recommended that the floor decks in all cases be placed by the railroad companies' forces. The work should be well and accurately done in accordance with well-developed plans. Many ties have been spoiled by improper dapping on account of uncertainty of the requirements shown on undeveloped plans. The railroad companies' forces are just as liable to make such errors as are contractors' forces. If the contractors' forces are required to maintain traffic, it would appear better that they should also be required to frame and place the ties, as placing of these ties is necessarily a part of the maintenance of traffic, and if in any change of the old structure to the new structure, the railroad companies' forces are not available or are not on the ground, there will be delay in the execution of the work, or the contractor will have to put all ties in for his own protection.

In the case of solid floors where ballast is used, traffic must be carried on temporary stringers during the erection of the work. When the ballasting is done by the company's forces, as is customary, these stringers should be furnished and removed by them in order not to hold the contractor at the site after all his work has been finished.

Many railroads require that a special paint be used on their structures. As the paint applied after erection is a part of the material which enters into the permanent construction, it should be furnished either by the manufacturer of the steel work or by the railroad company, and the application alone left to the erector. Bridge erectors usually do not make a very good job of painting; for this reason a number of roads prefer to paint with their own forces, but, if the erection is done by contract, it is necessary for the contractors to know whether or not they are to do this work.

The question of responsibility during the construction of a piece of work could perhaps be more properly covered in the contract, but as the specifications form a part of the contract and are the governing rules for the execution of the work in the hands of the erector, it is well to define the contractor's responsibility in order that the man doing the work may know where he stands.

When erection work is done by the company's forces alone the question of responsibility does not arise. When done by the manufacturer or by an independent contractor, there is in all justice a division of the responsibility between the railroad company and the contractor. The contractor should undoubtedly be held responsible for all accidents, loss or damages to his own work, his materials or his plant, due to any cause, whatever. As the company's materials are in his hands, he should also be responsible for it in case of accidents, due to causes within his reasonable control. It is proper for him to carry insurance against injury to workman, and protect the company in case suit is entered. It is, however, not fair to make him responsible for damage to the company's property or materials when such damage is due to causes beyond his reasonable control, as this is a matter against which he could not protect himself. The mere fact that he had charge of the company's property at the time of such accident is no reason why he should pay such costs.

There should be no material difference in the requirements of specifications, whether the work is done by the company's forces, by contractors or by a combination of the two, since rules governing the proper execution of work are just as necessary for the company's forces as for the contractor's forces, and the work should be of ample strength and of workmanship suitable for the purpose, no matter who does it.

The following specifications are submitted for the purpose of discussion:

SPECIFICATIONS FOR ERECTION OF RAILROAD BRIDGES.

1. The work of erection shall include the furnishing of all labor, tools, equipment and materials, other than those which enter into the permanent structure, the removal of the old bridge, if any, and the construction of the new superstructure ready for the rails, all in accordance with the plans and specifications.

2. The railroad company when inviting proposals for erection will state where the materials will be delivered and whether on cars or stored, what materials, spur tracks for convenient handling of materials, transportation, engine or work train service and flagmen they will provide, and whether they or the contractor shall construct all falsework or protection work, remove old bridge, maintain traffic, construct solid floors, frame and place the ties, waterproof and paint the steel work. The contractor shall furnish the erection equipment and do all work specified in the inquiry and according to the requirements of the plans and specifications.

3. The method of erection, except where local conditions justify a special scheme, will generally be at the discretion of the erector, subject to the approval of the engineer.

Where conditions justify a special scheme, the requirements will be clearly stated or shown on plans.

4. Bridges shall be erected in accordance with approved plans of the falsework and permanent structure. Approval of contractor's plans shall not be considered as relieving the contractor of any responsibility.

5. Erection shall not be started until sufficient material has been delivered to enable the work to proceed continuously, nor until the erector has been authorized to proceed. It shall be conducted with a force of men and plant sufficient for speedy completion and in such manner as to be at all times subordinate to the unobstructed use of the tracks of the company, and so as not to interfere with other work in progress, or close thoroughfare by land or water, except under proper authority.

Traffic and work must be protected by flag-

men whenever necessary, and competent watchmen shall guard the work and materials against injury. All laws and ordinances applying to the work shall be complied with, the necessary permits obtained, and lights provided to protect work at night.

6. When engine or work train service is desired by the contractor, he shall give the proper railroad officials at least 24 hours' advance notice, and the company will furnish the service according to conditions stated as promptly as possible, consistent with railroad operations. When derrick cars are used on main tracks, their movements shall be in charge of a regular train crew.

7. When transportation of equipment, materials and men is furnished free over the company's lines, it shall be subject to such conditions as may be stated.

8. The railroad company will furnish all masonry to correct lines and elevations, and unless otherwise stated will make all changes in old masonry without unnecessarily impeding the operations of erection. The company's engineers will establish lines and elevations, but the erector shall compare the elevations, distances, etc., shown on plans, with the masonry as actually constructed, so far as practicable with spirit levels and steel tapes, before he assembles the steel. In case of discrepancy he shall immediately notify the engineer.

9. Cars containing materials or plant shall be promptly released upon delivery. Materials shall be placed on skids above the ground, laid so as not to hold water and stored and handled in such a manner as not to be injured and not interfere with railroad operations. The expense of repairing or replacing material injured in handling by contractors shall be charged to the contractors. Material when being unloaded and stored shall be compared with the shipping list and any shortage or injury shall be promptly reported.

10. The temporary structures for use during erection and for maintaining the traffic shall be properly designed and substantially constructed for the loads which will come upon them. All bents shall be thoroughly braced transversely, and held against longitudinal movement by diagonal bracing or lines of struts extending from face to face of piers or other approved anchorages. The bents shall be well secured against setting, and piles driven wherever firm bottom cannot be obtained by wedging down the bents.

The maximum permissible unit stresses in any member shall not exceed the unit stresses recommended in the Manual of 1907, page 85, for wooden bridges and trestles, by more than 50 per cent.

Temporary falsework placed by the railroad company under an old structure or for carrying traffic over a new opening may be used by the erector during erection, provided it is not unnecessarily cut and wasted.

11. When traffic is maintained by the company's forces, any changes in structures carrying the traffic, required for the purpose of facilitating erection by contract, shall be made by the contractor, under the supervision of the company's representative.

12. Metal work in old structures shall be dismantled without any unnecessary damage and loaded on cars or neatly stored at the site, immediately adjacent to the tracks and at a convenient grade for future handling, as may be directed. When a structure is to be used elsewhere, all parts shall be match marked, in accordance with diagram to be furnished by the engineer, and when the old bridge is composed of several spans, the parts of each shall be kept separate. All trestle work placed under the old bridge for support shall be considered part of the old structure.

13. All steel work shall be adjusted to correct position and true to lines before being permanently connected, threads of pins protected by pilot and driving nuts, and, wherever permanent bolts are used, the nuts effectively locked by checking the threads. Moderate drifting will be permitted in order to draw parts together, but not for the purpose of matching unfair holes. Such holes shall be reamed or drilled.

All splices and field connections shall be securely bolted before riveting, and important connections, such as tension splices and attachment of stringers and floor beams, shall have at least 75 per cent of the holes filled with bolts, when the parts are required to carry the traffic. When not carrying any traffic at least 50 per cent of the holes shall have bolts. Rivets in splices of members shall not be driven until the members have been subjected to the full dead load stresses.

Rivets shall be uniformly heated to a light cherry red color, and when driven shall completely fill the holes and be tight. The heads shall be full and uniform in size, concentric, free of fins, in full contact with metal and be painted immediately after inspection and acceptance. Rivets shall be inspected immediately after being driven and those rejected shall be cut out and replaced without delay.

14. Minor misfits which require a reasonable amount of reaming, cutting and chipping in order to permit accurate assembling shall be considered a legitimate part of erection. Errors in general dimensions and misfits or holes so badly matched as to require drilling or cutting apart of metal work cause extra work properly chargeable to the manufacturer. Such errors shall be reported to the engineer as soon as discovered and corrections made during the presence of the inspector who shall check the time required. All extra work ordered will be paid for at actual cost to the contractor for labor and materials, plus 15 per cent for use of tools and supervision.

15. Holes for anchor bolts, except where bolts are built into the masonry, shall be drilled by the erector and set in Portland cement grout or lead after the span is in place.

16. Bed plates shall be set level in exact position and have a full and even bearing over their entire surface, a thin layer of Portland or rust cement or lead being used for this purpose.

17. Floor decks shall be constructed strictly in accordance with the approved plans. In case of wooden floor decks, the ties shall be framed so as to give a full and even bearing on the girders and under the rails. The outer edges shall be sawed off to correct lengths and be in true line. Guard rails shall be dapped and framed to a tight fit over the ties and secured as shown on the plans.

When structures have a camber of more than one-half inch, ties shall be framed so as to take out all camber over this amount, except when the bridge is composed of one span only, in which case the camber may be neglected.

18. The paint used shall be of such color, quality and manufacture as may be specified. The metal shall be thoroughly cleaned of dirt, rust, loose, scale, blistered paint or paint which has been damaged in handling. Surfaces inaccessible after erection, such as bottoms of base plates, tops of stringers, etc., shall receive two coats before assembling in place and the balance of the metal work shall receive two coats after erection. There shall be sufficient time allowed between the coats to allow the first to dry before the second is applied, and no painting shall be done in wet or freezing weather nor when the surface of the metal is damp. Painting shall be done in good and workmanlike manner, subject to strict inspection during progress and after completion.

19. Upon completion of the steel work all surplus material, debris and temporary structures shall be removed and the premises left in a neat condition. The material from temporary structures, if the property of the company, shall be neatly stored near the site or loaded on cars as may be directed.

20. All work done and materials furnished shall be of good quality.

21. The work of erection shall at all times be subject to the inspection and acceptance of the engineer or his representative on the ground.

22. When work is done under contract, the contractor shall assume all responsibility for loss or damage to his own work, materials or plant, due to any cause whatsoever; also for all loss or damage to the railroad company's materials or property and to other property adjacent to the railroad, due to causes within his reasonable control.

He shall assume all responsibility for injury to the workmen, or the public or to any individual, and in case of accident or suit, he shall defend the suit in person, and relieve the company from all costs and expenses, and pay any judgments that may be recovered thereon.

He shall comply with the local or Government laws or ordinances controlling or limiting the manner of doing the work and shall take such precautions as may be necessary to protect life and property.

Cost of Patching Asphalt Pavement at St. Augustine, Fla., Using a Portable Repair Plant.

The city of St. Augustine, Fla., has a considerable yardage of asphalt pavement, some of which, for several years past, has been badly in need of repairs. As the city had no asphalt repair plant various makeships to methods have been employed for filling the holes, which appeared in the pavement. For several years past it has been the practice to fill these holes with brick.

During the past winter the city undertook a general scheme for repairing its asphalt pavement and for this purpose secured Hooke portable asphalt repair plant, paying $537 for it. The first patch was laid on Nov. 1 and the last patch on Feb. 1. During the period of 83 days a total of 4,290 sq. yds. of patches was put down. These patches were small in size and were scattered over several streets. Over 31,000 brick which had been used in patching these holes were removed and used for other purposes. The average thickness of the patches was 1½ ins., and the average number of square yards placed per day was 551.

As the local labor had had little experience in asphalt repair work, an experienced man was secured from Chattanooga to instruct the workmen and foreman, and he remained with the gang for the first ten days.

The repair gang consisted of the following:

	Per day.
One foreman	$ 4.00
4 laborers in asphalt plant at $2	8.50
2 laborers chipping old pavement and getting holes in condition to receive new material, at $1.50	3.00
Supply wagon and driver	2.50
Total per 8-hour day	$17.50

On the basis of an average yardage placed per day of 51, the unit cost of the labor was as follows:

	Per sq. yd.
Foreman	$0.078
Labor in asphalt plant	.157
Labor shipping, etc.	.060
Supply wagon and driver	.050
Total (55 sq. yds. per day)	$0.345

The cost of the materials used in the work was as follows:

Asphaltic cement, per ton	$26.20
Ridge sand, per cu. yd.	1.80
Portland cement, net, per bbl.	1.50
Wood, per cord	5.00

Owing to the rush with which the work was carried on holes were burned in the pan of the plant, the repairing of which cost $127.41. In addition to the patch work 1,270 sq. yds. of new concrete base was laid at a total cost of $990.60, or 78 cts. per square yd. This cost includes the removing of the brick patches and the relaying of the brick along the street railing line. The total cost of the work including repairs to plant and new concrete base was $3,425.77 or an average of 79.8 per square yard for the whole work. The cost of the asphalt patches alone, material and labor, was 56.67 per square yard. The work was undertaken at the suggestion of Mayor Eugene Masters, to which we are indebted for the above information.

Cost of Street Sprinkling.—The following table shows for ten years the miles of street sprinkled and the cost per mile for sprinkling in the city of Hartford, Conn.:

Year.	Miles.	Cost per Mile.
1899	11.37	$ 479.73
1900	47.40	556.30
1901	46.75	490.09
1902	48.20	489.10
1903	49.05	490.56
1904	50.04	492.44
1905	51.07	492.45
1906	52.12	335.66
1907	54.57	354.11
1908	56.11	344.70
	502.27	$4,516.14
Average	50.23	$ 451.61

The Grand Trunk Pacific Ry.

One of the largest railway undertakings at present under way is the construction of the Grand Trunk Pacific Ry. in Canada. Ground for this transcontinental road was broken at Fort Williams, Ont., on Sept. 11, 1905, and now 4½ years later, out of a total mileage of main line and branches of approximately 7,900 miles, there have been completed or are under construction approximately 4,800 miles or 60 per cent of the entire mileage authorized by the company's charters. Of the main line from Monston to Prince Rupert, a distance of 3,550 miles, a total of 2,000 miles has been placed under construction, on which there has been laid 1,795 miles of track which in some cases is made up of disconnected sections, and is therefore not all continuous. That portion of the line, however, from Winnipeg to Edmonton, 793 miles, has been constructed and has been in partial operation by the construction department for the past 18 months and within the past 90 days the track has been completed continuously from Edmonton westerly to Wolf Creek, 122 miles, thus completing the track laying on that portion of the line designated as the prairie section, Winnipeg to Wolf Creek, 915 miles. The track laying was also recently completed from Winnipeg to Fort William, thus making a continuous line from Fort William, via Winnipeg and Edmonton, to Wolf Creek, 1,360 miles, which however cannot be completed for practical operation for some months, as considerable work is required to be done on the easterly and westerly ends of the line, to put it in a suitable condition for the movement of regular trains. The other portions of the main line on which the rails have been laid are situated at different points east and west of the city of Quebec. During the past year contracts have been let for the construction work from Wolf Creek, Alberta, westerly to Tete Jaune Cache in the Rocky Mountains, 179 miles, and there are at present engaged on this section of the line 1,000 teams and a large number of men. Similar forces are also engaged on the construction of the line from Prince Rupert, the terminus of the Pacific coast, easterly to Aldemere, B. C., 240 miles. In addition the provincial governments of Saskatchewan and Alberta passed acts at the sessions of their legislatures in 1909, authorizing guarantees for the construction of branch lines by the Grand Trunk Pacific railway company in these provinces to the extent of 686 miles, comprising branch lines from the main line of the Grand Trunk Pacific railway to Yorkton, Regina, Battleford, Calgary, Lethbridge, McLeod and Coutts, the construction of which is at present under way. At the session of the Saskatchewan legislature in December, 1909, an act was passed authorizing the guarantee of the construction of additional branch lines by the Grand Trunk Pacific railway in that province, to the extent of 475 miles, comprising lines southeasterly to the United States boundary line, from the main line of the Grand Trunk Pacific railway to Prince Albert, and from Regina westerly to Moose Jaw, Calgary, etc., and the construction of these will be undertaken during the present year.

Petitions bearing the signatures of 18,759 voters have been submitted to the Common Council of Detroit, calling for a popular vote on the question of municipal ownership of the street railway system.

LETTERS TO THE EDITOR.

Reinforced Concrete Flat Plate Floors.

Sirs. I note a paper by Mr. MacMillan, presented at the National Association of Cement Users, given in your issue of March 23. In this connection the writer would call attention to the following points.

First. That in his experimental work he has taken open hearth medium steel, the yield point of which is well known, and has tested the construction to the yield point of the metal. His method is based on definite knowledge as to the stress in the metal under load and is not based on assumptions of any kind.

Mr. MacMillan has overlooked the statement in the writer's publications that the coefficients given by him hold good only for nearly a fixed ratio between the width of the belt and the column spacing and that there is a large variation where this ratio is departed from. In Mr. Mensch's designs, as the writer looks at it, he has departed from the economic width of belt, hence must use a larger coefficient for bending.

Mr. MacMillan's statement that the economy of the flat plate system disappears with rectangular panels is somewhat incorrect. The writer has put up many having dimensions 18x30 ft. If Mr. MacMillan had checked up his method by deflections we believe he would have come to different conclusions.

Yours truly,

C. A. P. TURNER.

Minneapolis, Minn., Mar. 24, 1910.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

Notes from Technical Societies.

Nebraska Conservation and State Development Congress.—Among the papers to be presented at this congress, which will be held at Lincoln, Neb., March 29 and 30, are the following: "Good Dirt Roads for Less Money," F. W. Chase; "Culverts and Bridges," M. M. Stearns; "Town and Rural Water Supplies," address by an authority on this subject, address illustrated by maps and stereopticon views representing actual conditions in Nebraska; "Forestation," H. A. Mast, U. S. Dismal River Forest Reserve; "Irrigation," E. C. Simmons, F. C. Krotter and A. W. Hamilton.

Personals.

Messrs. Edwin M. Evans and Charles F. Puff, Jr., Civil Engineers, have moved their office from 900 to 805 Rothschild building, 14 South Broad street, Philadelphia, Pa.

Major General Will T. Martin of the Jeff Davis Legion, C. S. A., died at his home, Montaigne, March 16. General Martin promoted and built the Natchez, Jackson & Columbus R. R. and was president until the road was sold to the Yazoo & Mississippi Valley R. R. He was 87 years old.

The City Council of Pleasant Ridge, Cincinnati, O., on March 16 accepted and adopted the surveys, maps, plans, designs and estimates of their engineer, Mr. Donald W. Caven, for a sewerage system and plant to cost approximately $227,000, and covering about 15 miles of vitrified pipe sewers.

Mr. L. H. Conklin, recently General Manager of the Scranton Electric Company, has taken a position with J. G. White & Co., Inc., New York, as Engineer in the Operating Department. Mr. Conklin, who was previously Superintendent of Lighting and General Superintendent of the West Penn. Rys. Co., of Pittsburg, has had a varied experience in electrical engineering work. He is a graduate of Pratt Institute of Brooklyn.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Steel Tape.—Paper, 5½x7¼ ins., 32 pp. Chicago Steel Tape Co., Chicago, Ill.

A descriptive catalogue of steel tapes and field engineers' supplies.

Concrete Molds.—Paper, 9x11¾ ins., 20 pp. Miracle Pressed Stone Co., Minneapolis, Minn.

Describes molds for making concrete sewer pipe and drain tile, concrete culverts, double air space blocks and ornamental fans and forms, etc. Also shows some concrete mixing machines and finishing tools. Prices are given.

The Machinery List.—Paper, 4x6¼ ins. A. H. Hitchcock, Monadnock Blk., Chicago, Ill.

Users of sawmill and wood working machinery will find this little booklet very handy. It lists wood working machines of every description. It is published monthly and is free to machine users on application.

Specifications for Portland Cement.—Paper, 3½x6 ins., 4 pp. The American Bureau of Inspection & Tests, Chicago, Ill.

Contains specifications for Portland cement adopted by the American Society for Testing Materials. In addition a table is furnished showing the amount of materials required for a cubic yard of rammed concrete.

Concrete Porches.—Paper, 5¼x7 ins. The Simpson Cement Mould Co., Columbus, O.

This booklet tells how to build fine concrete porches. The information is given in a practical way accompanied by useful data on prices of concrete work. This company also sends a 37-page book describing the molds made by them together with handsome illustrations showing some of the ornamental effects produced by the use of concrete blocks and forms.

Underground Transmission Railway Signaling. Paper, 3¼x6 ins., 20 pp. McRoy Clay Works, The Rookery, Chicago, Ill.

A treatise on underground conduits for wires used to transmit electrical energy in railway signaling work. The advantages of underground transmission over exposed overhead wiring is pointed out. Some construction details of the conduits made by this company are shown.

Boiler Tests.—Paper, 6x9 ins., 24 pp. American Ship Windlass Co., Providence, R. I.

Contains the results of tests on boilers equipped with Taylor Gravity Underfeed Stokers.. Comparisons are made between stoker test quantities and hand firing test quantities.

Steel Bound Concrete Curb.—Paper, 6x9 ins., 8 pp. Steel Protected Concrete Co., Philadelphia, Pa.

This company sends an illustrated pamphlet with enclosed circular matter describing a system for protecting exposed corners on curbs, sidewalks, steps, columns, etc. The merits of the galvanized corner bars used by them are shown.

Wood Rock Drill.—Wood Drill Works, Chicago, Ill.

A three-leaf circular sent by this company describes the new model No. 5 Wood Rock Drill. This machine has a capacity of 50 ft. with a 4-in. hole at the bottom and is adjustable to the required working force.

Hydraulic Jacks and Pressure Pumps.—Catalogue No. 8. Paper, 4x7¼ ins. Richard Dudgeon, Broome and Columbia streets, New York, N. Y.

Contains descriptions, fully illustrated, of hydraulic jacks and pressure pumps of value to contractors. Directions for using these tools are given.

Reinforced Concrete Specifications.—Reinforced Concrete Construction Co., St. Louis, Mo.

This company sends a handsome portfolio of photographs of buildings erected by its construction forces and includes in the portfolio specifications which are up to date and well worth the attention of engineers and architects.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal feature of railway construction work of the past week has been the awarding of contracts by the Canadian Pacific Ry. for new work in Western Canada. Foley, Welch & Stewart, St. Paul, Minn., and J. D. MacArthur Winnipeg, Man., got the greater part of these contracts, the former getting the bulk of the western work and the latter the work near Winnipeg. In addition J. Bradley secured the contracts for the C. P. line from Regina, Sask., to Colonsay, 140 miles and Janse, MacDonald & Timothy secured the contract for constructing the Western portion of the C. P. line from Outlook. A. Kirk, Antigouish, N. S., has been awarded the contract for constructing the ten-mile branch of the Intercolonial Ry. from George's River to Sydney Mines, Cape Breton. Other contracts let recently are as follows: The Callahan Construction Co., Knoxville, Tenn., for continuing the construction of the Wasioto & Black Mountain R. R. from Harlan, Ky., for a distance of 27 miles, the contract involving 550,000 cu. yds. of mountain rock work; J. C. Kelso, Galveston, Tex., for clearing, grading and fencing 16 miles of road bed for the Houston-Galveston Interurban Ry. in Galveston County, Texas; M. N. Sikes, Ramsey, Ala., for cleaning, grubbing and grading the 25-mile extension of the Alabama, Tennessee & Northern R. R., south from Geiger, Ala.; The Carter Construction Co., Chicago, Ill., for the revision of the main line of the Cincinnati, Hamilton & Dayton Ry., from Piqua Junction for a distance of 10½ miles and Morriss & Shepard, St. Paul, Minn., for 35 additional miles of Great Northern R. R. work, in North Dakota.—The Advisory Board for the New York State Barge Canal has approved plans for three additional contracts and bids will be asked shortly. These contracts are as follows: No. 62, for the improvement of the canal from the west line of Monroe County to the east end of Contract No. 9 at Eagle Harbor, a distance of 14.5 miles, the estimated cost being $2,152,330. Contract No. 27-A, for completing a section of the Champlain Canal from the south end of Dunhams Basin Road to the Hudson River at Fort Edward, a distance of 3.76 miles, estimated cost being $380,433. Contract No. 79, for the construction of a highway bridge over the Oswego Canal at Bridge St., Oswego, at a cost of $39,325.—The House Committee of the U. S. House of Representatives on March 22 agreed on a bill which provides for a substantial enlargement of the engineer corps of the army. The measure increases the number of officers in the higher grades and provides for filling vacancies in the second lieutenancies as far as practicable by promotion from West Point.—The Canadian government has decided to approve of the waterways treaty with the United States as drafted in 1908 with the senate rider. This treaty provides for control of international waters for power, irrigation and navigation purposes. The original treaty was approved by Canada, but in the course of its passage through the American senate a rider was added providing that existing rights of riparian owners on the St. Mary's river at Sault St. Marie in either country should not be affected. By the treaty the amount of water to be taken from the Niagara on the American side is limited to 20,000 cu. ft. per second and on the Canadian side to 36,000 cu. ft.—Steam shovel 213 working in the Culebra Construction District of the Central Division of the Panama Canal on March 5, broke all records for daily excavation since the commencement of work by the United States. During the working day of eight hours, that shovel excavated 4,009 cu. yds. of rock and earth, loading 211 Lidgerwood flats with the material removed. The shovel was under steam eight hours, was actually digging seven hours, and was waiting for cars etc., one hour.

Width of Macadam Roads.

A club has been formed by the merchants and farmers in one of the counties of a western state for the purpose of securing the construction of improved roads in the county. The club has gone about its work in a sensible fashion and has already secured the building of several miles of macadam roads. One of the slogans of the club is: "Take it off the sides and put it on the ends," the meaning being that a macadam road should be constructed only to a width suited to the demands of the traffic, and the money thus saved should be used in making the road of a greater length. We commend this slogan to the attention of road engineers. The standard width in this country for the macadamized roadway of improved roads is 16 ft. and many road engineers are accustomed to use this standard without considering whether the traffic is or is not sufficient to warrant such a width. Many country roads undoubtedly do not carry sufficient traffic to warrant a 16 ft. improved roadway, but they do have traffic enough to warrant an improved roadway of less width. Among the earliest road builders to appreciate this fact was A. J. Cassatt, late president of the Pennsylvania R. R. Mr. Cassatt, as is well known, was a civil engineer by profession, but it is less well known that he was very much interested in highway construction. However, for 15 years he served as Road Supervisor in Lower Marion Township, Pa., during which time he constructed over 40 miles of stone roads. In a letter written in 1897, at which time he was a director of the Pennsylvania R. R., he had the following to say regarding the economic widths of macadam roads: "Experience also teaches me that it is useless to make the roads too wide. For any ordinary country road we find it sufficient to spread the stone to a width of 12 ft.; this will be increased to 13 ft., or perhaps a little more, by the action of the roller. Thirteen feet is sufficient to allow two vehicles to pass without going off the stone, and in our neighborhood, which is a suburban one, and where there is considerable travel on all the roads, I think this is not too wide. In some country districts a lesser width would no doubt do, but it would seem to me that 8 ft. ought to be the minimum width, and that as between this and 12 ft. there would be no necessity for increasing the width, for, unless you went to the latter width, vehicles would have to turn on to the sides of the road to pass each other. On a road narrower than 8 ft. all the travel would be right in the center of the road, and the wheels would follow each other so that the road would be likely to wear into ruts. This, however, is theoretical on my part, as I have never built any roads less than 12 ft. wide."

They Also Serve.

The annals of construction work contain many instances of heroic deeds and devotion to duty. Seldom is a large piece of work completed without some man having shown the qualities which go to make a hero. In most cases these heroic deeds are quickly forgotten except by those directly concerned in them. But in some cases the deed is such that it is remembered long. Such a deed was the sacrifice of the two bridge men on the new Queensborough bridge over the East River at New York City. Here two steel men were working 100 ft. in the air, putting in place a heavy steel plate. Just as the plate was being put into place it began to slip. The two men realized that if it fell at least three of their comrades would be killed, so they thrust their bare hands into a crevice beneath the plate, which continued to grind down for a few minutes but was stopped before it did any other damage. The sacrifice stopped the plate but it crushed the men's hands so that they had to be amputated. Another example of heroism occurred a short time ago at Panama. In this case the hero was a Spanish laborer, Angel Alvarez by name, who was working as "dobey" man with the crew of a steam shovel in the Culebra cut at Bas Obispo. In reporting the occurrence the superintendent of construction in the Bas Obispo District said: "Alvarez had placed a 'dobey' consisting of ten or twelve sticks of dynamite on a rock in the bottom of the pit. One of the pitmen noticed a rock falling from the top of the bank and shouted to Alvarez, who, with rare presence of mind, tried to snatch the dynamite away. He succeeded in getting nearly all, but unfortunately did not get the exploder. The result was that Alvarez was the only one injured, notwithstanding the fact that the entire shovel crew, a conductor and a brakeman, were within 20 ft. of the explosion. There were seven or eight sticks of dynamite found on the ground in the immediate vicinity, which could have come only from this particular shot." In the explosion, Alvarez' right foot was fractured, right great toe burned off, right arm and side burned, and left side burned. He was taken to the Ancon hospital, and we are glad to record that he is now slowly recovering

The Plainfield Horse Car Co., of Plainfield, N. J., is to apply to the State Legislature for an extension of its charter for five years. If this extension is granted the company will take steps this year to establish a belt trolley line to extend from Metuchen to Plainfield, to North Plainfield, to Warrenville, to Dunellen, to South Plainfield to Oak Tree, thence to Metuchen. J. Fred MacDonald, Plainfield, N. J., is a director.

Messrs. Libbey and Dingley of Lewiston, Me., chief promoters of the proposed trolley line from Lewiston to Portland by way of Gray, have made arrangements to build the line themselves and will begin construction at the Auburn end within a month.

The street railway system at Missoula, Mont., owned by W. A. Clark, is to be extended, and it is possible that in the near future a line will be built along the east side of the Bitter Root river to Hamilton.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ALABAMA.

M. N. Sikes, Ramsey, Ala., has the contract for clearing, grubbing and grading the 25-mile extension of the Alabama, Tennessee & Northern R. R. south from Geiger, Ala., to the A. G. L. R. R. Mr. Sikes would like to hear from contractors having idle teams, and he could also use from 300 to 500 station men. Part of the work will be sublet. Buckner & Daniels, Panola, Ala., have the contract for the crossties and bridge work. Wm. Toxey, Cochrane, Ala., is chief engineer of the railroad, and John T. Cochrane, Mobile, is president.

ARKANSAS.

The Missouri & North Arkansas R. R. contemplates expending $750,000 on betterments between Leslie and Helena, Ark. A large force of men and several steam shovels have been at work north of Leslie loading ballast, some of which is hauled below Searcy. The company has purchased of the Baldwin Locomotive Co. several 120-ton engines of a special design for this road. Fred W. McNeil, Searcy, Ark., formerly of St. Louis, is engineer of maintenance of way and is revising the grades and alignment. All curves over 2 degrees will be spiraled with the Searles spirals and the roadbed put in shape, good for 40 miles per hour between Kansas City and Helena.

CALIFORNIA.

We are advised that the projected extensions of the Oakland Traction Co. in Oakland are of such character that they will be done under the direction of the company and with its own equipment.

Palmer, McBryde & Quayle, San Francisco, Cal., have been awarded the contract for constructing a five mile extension of the Pacific Electric Ry. from Pillsbury easterly. George E. Pillsbury, Los Angeles, is chief engineer of the railway.

H. Hauser, 509 Central Bldg., Los Angeles, Cal., has the contract for constructing the Richfield-Fullerton cutoff in Orange County for the Santa Fe. The contract includes 100,000 cu. yds. earth excavation, 120,000 cu. yds. embankment and 2,000 cu. yds. concrete masonry. None of the work is to be sublet, and it is to be completed in 60 days. The award of this contract was mentioned in our March 16 issue.

GEORGIA.

The construction of a railroad from Irwinville to Ashburn, Ga., is proposed, but no definite plans for building the road have been made as yet. W. A. Shingler, Ashburn, Ga., is interested.

ILLINOIS.

Surveys are now being made for the projected line of the Rock River Traction Co. As projected the total length of this line will be 124 miles with a route as follows: Princeton to Geneseo and Rock Island; Sterling to Geneseo; Morrison to Prophetstown, and Geneseo to Kewanee, and also to Galesburg. The time for awarding construction contracts has not yet been determined. F. W. Sears, Prophetstown, Ill., is Chief Engineer, and Hugh W. Cole, Geneseo, Ill., is President.

INDIANA.

The Walsh Construction Co., Davenport, Ia., as stated in our last issue, has the contract for constructing the Evansville, Mt. Carmel & Northern Ry. (Big Four line) from Mt. Carmel, Ill., to Evansville, Ind. The contract involves excavation, bridging, fencing, tracklaying and ballasting and includes 1,800,000 cu. yds. of earth excavation, 750,000 cu. yds. rock excavation, and a bridge over the Wabash River, 3,000 ft. long. John Hickey Bro., St. Louis, Mo., has the sub-contract for the concrete and trestle work.

KANSAS.

The Electric Traction Construction Co., 218 Scarritt Bldg., Kansas City, Mo., wishes to sublet 25 miles of railway work in Kansas on which there are 402,301 cu. yds. of grading, etc.

The Garden City, Gulf & Northern R. R. now has 42 miles of line in operation and 75 miles under construction from Garden City to Liberal, Kas. W. H. Cost, Garden City, Kas., is chief engineer, and B. M. McCue, Garden City, is president. The Kansas Construction & Irrigation Co., E. A. Tennis, president, Garden City, has the contract for constructing the line.

KENTUCKY.

The Callahan Construction Co., with home offices in the Empire bldg., Knoxville, Tenn., has just been awarded the contract for a further extension of the Wasioto & Black Mountain R. R., commencing at Harlan, Ky., and extending in a northeasterly direction along the mountains for 27 miles. This extension is in addition to a contract that the Callahan Construction Co. has already under way for the same road covering a distance of 24 miles and extending from Pineville to Harlan, making in all, 51 miles. This new contract comprises some 550,000 yds. of very fine mountain rock work, together with a large amount of excellent scraper work; also one tunnel 600 or 700 ft. long, and a considerable amount of cut stone bridge masonry, concrete work, etc. Mr. E. R. Keller, General Superintendent for the Callahan Company will be in charge of this contract and will be located at Harlan, Ky.; telegraph address, Harlan, Ky., via Hubbard Springs, Va. The company is arranging to put outfits on this work immediately and expects to complete same by late fall, so as to give the contractors the advantage of working during the summer months. Contractors interested in any of this work can confer with Mr. Keller at the above address, or can see Mr. Geo. W. Callahan, President of the company, at the home office, Knoxville, Tenn.

LOUISIANA.

Surveys have been completed for the projected 15-mile line of the Kinder & Northwestern Ry. The construction work has been let and three miles of the line completed. The road is to extend northwest from Kinder to the timber lands of the Peavey, Byrnes Lumber Co. The contractor for the work is a Mr. Walker of Kinder, La. A. J. Peavey, Shreveport, La., is President, and Frank Shutts, Lake Charles, La., is the engineer.

NEVADA.

The Tonopah & Goldfield R. R. has an engineering party now in the field running a preliminary line to Mono Lake. Nothing definite will be decided regarding construction until these surveys are completed, which will be some time in the future.

OHIO.

The Ashtabula Electric Street Ry. Co., Haskell Bldg., Ashtabula, O., is asking bids until Apr. 8 for the construction of 10 miles of electric railway. Profiles, etc., can be seen at the office of the company in Ashtabula.

Preliminary surveys have been completed and contracts let for the Ashtabula electric street railway and construction will be started soon by the contractors, A. F. De Meyo & Co. of New York. The line will be six miles long and will connect with interurban lines to Cleveland, Erie and Jefferson. Local capital and eastern parties are interested. Chapin & Bryson of Ashtabula, O., are the engineers.

The Carter Construction Co., 184 La Salle St., Chicago, Ill., has been awarded the contract for the revision of the main line of the Cincinnati, Hamilton & Dayton Ry., between Piqua Junction and Saunders, approximately 10½ miles.

The Hocking Valley Ry. Co. has authorized the installation of six standard passing sidings on the Toledo division and five on the Hocking division, making a total of eleven on both divisions. W. Michel, Columbus, O., is engineer maintenance of way.

OKLAHOMA.

The Arbuckle & Western R. R. Co. has filed its charter and will let contracts shortly for its projected line. As proposed this road is to be 180 miles long and is to extend from Ardmore, Okla., to Chickasha and Lawton. M. S. Forcythe, West Chester, Pa., is chief engineer and Oscar O. Ayres, Olathe, Kas., and Ardmore, Okla., is president.

Preliminary arrangements are being made for 30 miles of railroad from Chattanooga, Okla., to Davidson, Okla. Arrangements for securing the necessary capital for construction have been made. One survey has been made and final surveys are to be started at once. Construction contracts are to be let in about 30 days. The line will require four bridges of an average length of 40 ft. J. H. Ransom, Chattanooga, Okla., is president.

TENNESSEE.

The Tennessee Traction Co. now has surveys under way for its projected line. The projected length of this road is 210 miles and it is to extend from Memphis, Tenn., to Nashville, via Brownsville and Jackson, W. K. Burton, Memphis, Tenn., is President and Geo. E. Bushnell, Memphis, Tenn., is General Manager.

TEXAS.

The Gulf, Texas & Western Ry. has made preliminary surveys for a 4½ mile spur from Jermyn toward the Stewart Coal Mines. John T. Witt, Dallas, Tex., is Chief Engineer.

The Texas North & South R. R. Co., recently incorporated, is to have surveys started soon for its projected 330 mile line from Seymour, Tex., to San Antonio. L. E. Collins, Coleman, Tex., is president.

The Fort Worth Mineral Wells & Western R. R. Co. will build a line of interurban railroad between Fort Worth and Mineral Wells Texas, a distance of about 63 miles. Permanent location is about completed, bids will be received in about 60 days. Paul Hurley, Fort Worth, Tex., is secretary.

The Houston-Galveston Interurban Ry. Co. has awarded the contract for clearing, grubbing, grading and fencing approximately 16 miles of road bed to J. C. Kelso, Galveston, Tex. The contract extends from Clear Creek to a point about two miles south of Texas City Junction in Galveston County, Texas. J. B. Townsend, 410 First National Bank Bldg., Houston, Tex., is the engineer for the railway.

Surveys have been made and the capital has been secured for the construction of a 17 mile extension of the Sugarland Ry. from Juleff south to a connection with the State railroad at Anchor. Construction contracts are to be let at once. W. T. Eldridge, Sugarland, Tex., is president and W. C. Yearger, Sugarland, is chief engineer. This is a standard gage line.

VIRGINIA.

The Chesapeake & Ohio Ry. has completed surveys for a line between Charlottesville, Va., and Orange, but has decided not to build at present.

WASHINGTON.

The Big Bend Transit Co. has completed surveys for its projected 65 mile line from Spokane, Wash., to the junction of the Spokane and Columbia Rivers. William A. Nicholls, Spokane, Wash., is President.

WISCONSIN.

Alex. McGavock, Hanover, Ill., has 250,000 yds. of Chicago & Northwestern Ry. work from Winston Bros. Co. at Packwaukee, Wis., and would like to get into communication with some of his old men. The work will require about a year's time.

Power Developments, Levees, Drainage and Irragition Works.

CALIFORNIA.

Plans have been completed for a concrete bulkhead to be erected for the city of Ocean Park, Cal. The structure will cost $18,000 and is to be built on a foundation of concrete piles. The work is to be done under the Vrooman act and contracts will be let in about 40 days. G. F. Lewis, city engineer, Ocean Park, Cal., is in charge of the work.

COLORADO.

The directors elected by the Granada and Holly Irrigation District met on March 19 and organized by electing W. A. Merrill of Lamar president and C. G. Smeltz secretary. It is the intention of the directors to immediately call an election authorizing a $1,250,000 bond issue and commence construction not later than June 10. The construction consists of a reservoir fill requiring 800,000 cu. yds. of earth and 80 miles of ditch. The system when completed will reclaim 40,000 acres of choice lands in Prowers County, Colorado.

DELAWARE.

Following bids were received March 18 by Maj. R. R. Raymond, U. S. engineer, Wilmington, Del., for dredging in Mispillion and Appoquinimink rivers, Delaware: Miner Engineering Co., Washington, D. C., conditional upon award of contract for dredging St. Jones and Murderkill rivers, Del., 18 cts. per cu. yd. for Mispillion River and 18 cts. for Appoquinimink River; River & Harbor Improvement Co., Philadelphia, Pa., work to begin July 1, 1910, 40 cts. per cu. yd. for Mispillion River work and 14 cts. per cu. yd. for Appoquinimink River work. For dredging in the (1) St. Jones River and the (2) Murderkill River, Delaware, the following bids were received: The Rickards Dredging Co., Philadelphia, Pa., (1) 14 cts, (2) 14 cts.; River & Harbor Improvement Co., Philadelphia, Pa., (1) 11.8 cts., (2) 10.9 cts.; Miner Engineering Co., Washington, D. C., conditional upon award of contract for dredging Mispillion and Appoquinimink rivers, Delaware, (1) 18 cts, (2) 18 cts.

IDAHO.

The Kings Hill Extension Irrigation Co., Ltd., Medbury, Idaho, will build two large dams during the summer and fall. Regarding this work Mr. L. G. Bradley of Medbury, manager of the company, writes us as follows: "The engineering work is not yet completed to a stage where we can give definite plans and specifications, but one dam will be an earthen dam of approximately 270,000 yds., together with gathering and distribution system for the reservoir. It is in all probability a grader and steam shovel proposition. Some of the earth is readily available, but some of the material will have to be brought a distance of 1,000 to 1,500 ft. and mixed with the light material that is handy. Foundation has been thoroughly tested and all along the line of the canals has been tested, so that the ground is now ready for the inspection of the contractors. Contractors visiting the site should get off at the town of Hammett on the Oregon Short Line and they will be taken to the dam site to look over the ground, and as soon as we are where we can get plans and specifications ready they will be furnished with same and asked to bid. The second dam this company will build is of smaller size, but somewhat more of a problem. It was originally planned to make it a concrete dam, but now looks like a rock filled dam will be resorted to. This dam will be about 600 ft. across the top and 60 or 70 ft. high. The gathering and distribution system for this reservoir will also be built."

MINNESOTA.

The Drake & Stratton Co., Hibbing, Minn., has the contract for stripping at the Dale-Uno mine located two miles west of Hibbing. The work requires 3,000,000 cu. yds. of earth excavation and seven steam shovels will be used this summer.

Bids are asked by the Board of Water Commissioners of St. Paul, Minn., John Caulfield, secretary, for dredging the West Arm of Vadnais Lake, situated about seven miles from the City of St. Paul. The work will consist of about 1,500,000 cu. yds., the material being mostly vegetation and peat.

MISSISSIPPI.

The Mississippi Levee District, W. J. Shackelford, Chief Engineer, Greenville, Miss., is to open bids April 27 for the construction of two new levees in the district involving a total of 927,000 cu. yds. One of these levees is to be built at Riverton two miles below Rosedale, Miss. This levee involves the following work: Sec. 1, Sta. 1575 to Sta. 1610, 158,000 cu. yds.; Sec. 2, Sta. 1610 to Sta. 1640, 226,000 cu. yds.; Sec. 3, Sta. 1640 to Sta. 1664, 143,000 cu. yds. The other levee is to be built at Shiloh which is opposite Blanton or Smeeds on the Y. & M. U. R. R. This work is as follows: Sec. 1, Sta. 4233 to Sta. 4264, 122,000 cu. yds.; Sec. 2, Sta. 5264 to 4292, 130,000 cu. yds.; Sec. 3, Sta. 4292 to Sta. 4321, 148,000 cu. yds. All of the above levee will be put up from riverside pits and will have 8 ft. crown with a one foot topping and banquette with 20 ft. crown 8 ft. below top. A seep ditch may be required to be cut on landside 120 ft. from toe of slope and material from same placed in the levee embankment without extra compensation. The work is to be completed by Dec. 20, 1910.

OHIO.

Bids will be received until noon, April 2, by the Department of Public Service of Cleveland, O., Robert Hoffman, chief engineer, for dredging in the Cuyahoga River. The work of dredging is to be divided into two contracts, known as Section No. 1 and Section No. 2. No. 1 will include the lower portion of the river and No. 2 the upper portion. Bids will be received based upon the approximate quantities of 225,000 cu. yds. in Section No. 1 and 300,000 cu. yds. in Section No. 2. The dredged material is to be dumped upon a dump established by the government in Lake Erie, a distance of five miles from the mouth of the river. The bids are to be based upon cubic yard, scow measurement. The portion of the river to be dredged is about five miles in length.

OREGON

The Willow River Land & Irrigation Co. of Vale, Ore., has closed contract with Jas. A. Green, 226 La Salle St., Chicago, Ill., for the engineering and construction on its project, comprising approximately 25,000 acres of land in Malheur County, Oregon. This work includes building two earth fill dams, each about 100 ft. high together with the construction of complete distribution system.

TENNESSEE.

No bids were received March 18 by Maj. M. L. Walker, U. S. Engineers, Memphis, Tenn., for levee work in the White River levee district. This work consisted of one piece of levee enlargement near Kangaroo Point, containing about 115,000 cu. yds. The work was to be built to an 8-ft. crown with 3 to 1 slopes on both sides and a 1-ft. topping added to the 8-ft. crown. About 4 acres of light grubbing was included. The fill was to have an average rise over old levee about 4 ft. to the new 8-ft. crown and the work was to be completed not later than Jan. 1, 1911.

TEXAS.

Bids are being asked by W. A. Morrison, Cameron, Tex., Commissioner of the Hefley Improvement District of Milan County, until 10 a. m. April 9, for constructing a levee. The right-of-way is 100 ft. wide and contains about 20 acres of timber land all told. The levee is to be 5.36 miles long and will have an average base width of 26.5 ft. and an average height of 7.5 ft. It will contain about 121,728 cu. yds. of earth.

CANADA.

Bids are asked by Napoleon Tessier, secretary of the Department of Public Works, Ottawa, Ont., until 5 p. m., April 12, for dredging required at the following places in the province of Ontario: Byng Inlet, Cobourg, Goderich (Kincardine, Lion's Head and Port Elgin), Owen Sound, Picnic Island, Port Burwell (Port Hope and Whitby), Rainy River, River Thames, Rondeau, Sault Ste. Marie.

Bids are asked by the Canadian Light & Power Co., E. A. Robert, managing director, Montreal, Que., until April 9, for rock and earth excavation in the Beauharnois Canal, between Valleyfield and St. Timothee; also for intake works at Valleyfield, including coffer dam and culverts in the canal. Plans, specifications and full particulars may be obtained at the office of the Canadian Light & Power Co., Montreal, Que.

The Huntsville Railway, Light & Power Co. of Huntsville, Ala., and the Huntsville & Monte Sano Improvement Co. are stated to have reached an agreement whereby the projected extension of the electric line to Monte Sano will be built at once.

Hayes Bros. have resumed work on the contract for the dam at Owl Creek at Belle Fourche, S. D. Hickey Bros. & Burke, who have the contract for facing the dam with concrete blocks, have also started work.

The Tampa & Atlantic Construction Co. of Tampa, Fla., has been incorporated with a capital stock of $150,000.

The New Orleans, Mobile & Chicago R. R., W. F. Owen, general manager, Mobile, Ala., has surveys in progress for an extension from Middleton, Tenn., to the Ohio River.

Arrangements for financing the proposed Butte & Boise R. R. are well under way and engineering parties are to be placed in the field shortly to make the surveys. L. O. Leonard, Butte, Mont., is reported to be interested.

The Territorial Engineer of New Mexico has approved the application of Engineer Ernest H. Fischer of Albuquerque, Mex., for a large power proposition on the upper Pecos and its tributary, the Mora, 25 miles east of Santa Fe. A maximum appropriation of 150 second feet is granted to develop 5,000 hp. at a cost of $150,000, to supply Las Vegas, Santa Fe and Albuquerque with electric power.

The contract for constructing the double track between Missoula, Mont., and De Smet on the Northern Pacific Ry. has been let to Albert Walker, of Missoula, who has been working in the vicinity of Bearmouth for some time past. Track construction is to be started at Missoula at once and the work rushed through to completion in two months.

The Mobile & Ohio R. R. Co. will immediately begin the improvement of about 1,000 ft. of dock property owned by it between St. Anthony and Adams Sts. in Mobile, Ala. R. V. Taylor, Mobile, Ala., is General Manager.

The Hopedale Development Co., of Hopedale, La., has been awarded a contract for constructing a drainage canal about 40 miles long in St. Bernard Parish, Louisiana.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Over $16,000 has been subscribed by the citizens about Corning, Ark., for the building of a spur from that town to Green's Spur, on the Frisco. J. E. Matthews, Democratic candidate for Sheriff of Clay County, is raising the subscription.

The Stuttgart & Rice Belt R. R. Co. has been chartered with a capital stock of $78,000. The road will extend through the rice counties of Arkansas, beginning at Mesa, in Prairie County, south to Stuttgart and thence to Cooper's Ferry, in Arkansas County, a distance of forty miles. The directors and incorporators are: J. R. Porter, L. H. Morphew, W. M. Price, George W. Fagan, J. A. Watkins, Walter J. Miller, Geo. C. Lewis, R. H. Toll, J. G. Thweatt, J. M. McClintock, Elliott Tollman, Edwin Pettit, John L. Ingram and Philip Reinsch.

The Memphis, Paris & Gulf R. R., now operating 106 miles of line, will shortly apply for articles of incorporation giving it permission to operate in Arkansas and Tennessee. It is stated that the right of way from Terrell, Tex., to St. Charles, Ark., has been surveyed and acquired. This is 346 miles and constitutes the main part of the division between Memphis and Dallas. H. C. McCluer, Nashville, Ark., is Chief Engineer.

The Arkansas Board of Railway Incorporators has granted the Gulf Magnolia & Northern R. R. Co. three years' additional time in which to build the road.

The Fort Smith Light & Traction Co., of Fort Smith, has asked the City Council of Van Buren for a franchise over certain streets.

The Fort Smith, Van Buren & Eastern Interurban Ry. Co. is to again apply to the City Council of Van Buren for a franchise. It is said that the company will guarantee to complete the line to Kibler, a distance of six miles, within two years.

Business men of Lockesburg have started a movement to induce the Iron Mountain R. R. Co. to extend the Arkansas and Louisiana branch of the system from Nashville to Locksburg.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Engineers of the Southern Pacific Co. have been making final surveys for an electric railway to connect Melrose and San Leandro.

The Fresno Traction Co., A. G. Wishon, Manager, Fresno, is planning to commence work in April on an extension of the Blackstone trolley line. Present plans include double tracking as far as Zapps.

Rodgers Bros. are working on their contract for clearing the right of way for the Sierra R. R. through the Curtis, Coburn and Snyder ranches near Rosedale.

The Stockton Terminal & Eastern R. R. Co. has applied to the City Council of Stockton for a franchise to operate cars in that city from Jenny Lind. The road is to enter Stockton on Acacia St., extended through Buttercup Grove.

Willliam M. Walsh of Auburn has been appointed timekeeper for the Southern Pacific Co., with jurisdiction along the line of the new cut-off improvement. His district will extend from Applegate Station to Colfax, with headquarters at the latter town.

L. W. Warmoth, Paskenta, is promoting a project for the construction of an electric railway from Paskenta to Sacramento.

Advices from Auburn, Cal., state that Joe Correa has contracted with the Southern Pacific Ry. Co. to remove 40,000 cu. yds. of earth and rock on the wagon road from Penryn to the J. H. Bickford place below Gold Hill, at a point where the cut-off intersects the road on the Penryn slope of Boulder Ridge. At one point the cut will be 59 ft. deep. Mr. Correa estimates it will take him five months to complete the work.

Press reports from Fresno quote F. U. Nofziger, who is engaged in securing rights of way for the proposed steam railroad from Porterville, Tulare county, to the foothill country at Springville, as stating that construction work on the new line will start not later than July 1 and that deeds for the necessary land have been secured from Worth to Globe, in the heart of the orange belt.

Harry Gray of Lincoln has been awarded the contract by the Pittsburg syndicate for excavating its canal in the Colusa reclamation district. The contract amounts to about $400,000 and calls for the removal of 1,500,000 cu. yds. of material.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Riverside Irrigation District have held a meeting at Greeley to complete arrangements for building the Wildcat reservoir on Wildcat Creek, to cost $100,000, and add to the present irrigation system of the district. It is estimated that the new reservoir will water an additional 10,000 to 12,000 acres, adjoining it on the east, and it is proposed to bond the district to pay for the reservoir.

It is reported here in Denver that the Chicago, Rock Island & Pacific R. R. has bought the Colorado & Eastern Road and is arranging for its own terminals into Denver, with a most important switch to the Denver stock yards.

The Huerfano Reservoir & Irrigation Co. of Denver has been incorporated, with a capital stock of $250,000, the incorporators being Lemeul J. Husted, Frank M. Keezer and Otis Beverstock.

The Denver, Colorado Springs & Pueblo Interurban Ry. Co. is securing right of way for its projected line. Location surveys are said to have been about completed. As now projected the line will make a detour to the east a short distance north of Colorado Springs, to avoid the high grade of the divide at Palmer Lake, with the result that it will be about eight miles from the present line of the Denver & Rio Grande Ry. at Husted. The two lines will gradually draw closer together as they near Denver. William Bulford, Denver, is president.

Work is to be resumed shortly on the Denver & Colorado Springs Electric R. R., which is to extend from Denver to Pueblo. Surveys have been completed as far as Palmer Lake. E. L. Briggs is Chief Engineer.

The Riverside Irrigation District Board, of Greeley, has awarded the contract for building Riverside reservoir No. 2 to D. A. Camfield, of Denver, and S. H. Shields for $500,000. The reservoir will receive its supply from the South Platte and Wildcat Creek, and will water 12,000 acres to be taken into the district on the east.

Final filings have been made in office of the State Engineer at Denver for three large reservoirs and a ditch for irrigating land in Bent County. The first reservoir will be constructed by throwing a dam 115 ft. high across the Purgatoire River. It will be known as Cuddoa Creek Reservoir No. 2, and will have a capacity of 107,100 acre ft. The estimated cost of this reservoir is $510,000. Another reservoir with a capacity of 86,540 acre ft. will be made by putting a 110-ft. dam across Cuddoa Creek. This one will cost $155,000, according to the engineer's estimate. The third and smallest reservoir will require a 75-ft. dam across Mud Creek, which will impound 16,118 acre ft. of water. It will cost $150,000. The high line canal which will distribute the water from these reservoirs will be 687,800 feet long with a 600 cubic foot capacity and will cost $1,600,000. F. H. Whiting of Denver is the engineer in charge of the work and Stephen A. Scott of Lamar is the president of the company which is undertaking the work. Granby A. Hillyar of Lamar is also interested in the project.

It is reported that A. H. Mohler, Vice-President and General Manager of the Union Pacific Ry. Co., has announced that construction work planned for Colorado and Wyoming, estimated to cost $12,000,000, will be started in the spring.

The Northern Colorado Railway Co. has been incorporated with a capital stock of $100,000 and proposes the construction of a railroad in Weld County. L. M. Fouts, W. C. Bradbury, T. C. Henry, et al., are the incorporators.

The Carr Reservoir & Irrigation Co. has been incorporated at Denver, Colo., with a capital stock of $100,000. The incorporators are Archie F. Finley, C. C. Rogers, Charles Finley, Dover, Colo.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Atlanta & Northeastern Ry. Co. has practically completed arrangements for financing its projected interurban line, which is to connect Atlanta with Cummings and Creighton, Ga., and is to cost about $900,000. The system is to consist of two lines, diverging at Alpharetta, the main line continuing northeast to Cumming and the branch running north and slightly west to the Creighton mines. The length of trackage from Atlanta to Cumming will be 42 miles, and that of the branch from Alpharetta to Creighton, 18 miles, giving a total mileage of 60 for the entire system.

Right of way has been secured for the projected electric railway from Indian Springs to Griffin and application has been made to the state railroad commissioners to be allowed to issue bonds to the extent of $1,500,000 and $200,000 of stock. W. F. Smith, Flovilla, and L. W. Roberts, Atlanta, are the promoters. It is also intended to build the line on to Social Circle at an early date.

The Columbus Power Co., of Columbus, is planing to build a dam on the Chattahoochee River, 12 miles above Columbus, and B. H. Hardaway, Columbus, has been awarded the contract for building a railroad from Motts, Ala., on the Central of Georgia line, to the site of the dam for the purpose of hauling material and machinery. The dam will be 70 ft. high and will develop 24,000 h. p. for the use of industries in Columbus, West Point and Opelika, Ala.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The local management of the street railway at Decatur is to submit estimates to the owners of this property for an extension of the line east to Geddis lane, a distance of about one mile.

The Terminal R. R. Association of St. Louis, W. S. McChesney, Jr., General Manager, St. Louis, Mo., has purchased 200 acres of land between East St. Louis and Madison and will spend about $250,000 in constructing yards and terminal facilities.

The trustees of the East Side Levee Sanitary District, Henry D. Sexton, President, Sexton Bldg., East St. Louis, has decided to construct a concrete retaining wall along the entire river from East St. Louis. The wall will cost about $82,000. One of the first undertakings of the construction department of the district will be the diversion of Cahokia Creek. The district is planning work which will cost about $6,500,000.

The St. Louis East Side Belt Terminal Ry. Co. has been incorporated with a capital

stock of $2,500 and headquarters at East St. Louis, Ill., and proposes the construction of a line from a point near Cahokia, Ill., near the Mississippi River in St. Clair County, to a point at or near Venice in Madison County, Ill. W. H. Hauss, East St. Louis, Ill.; Charles Smiley, O'Fallon, Ill.; F. W. Kraft, East St. Louis, Ill.; Albert E. Meintz, East St. Louis, Ill.; John L. Flannigen, East St. Louis, Ill., are the incorporators.

According to reports, preparations are being made by the division officials of the Chicago, Burlington & Quincy for the double tracking and improvement of portions of the Illinois division. The work includes the extension of the yards in Galesburg, Ill.

The Chicago, Milwaukee & Gary Ry., I. W. Troxel, chief engineer, Chicago, has completed plans for building shops, offices, switch tracks and rearrangement of yards in Rockford. The yards are to be entirely rearranged and 14 miles of switch tracks will be added to those which the company now operates. The place occupied now by the switch tracks will be devoted to "rip" tracks, on which cars in need of repair are to be run. The main tracks will be readjusted and an outgoing and an incoming line will be installed for trains going their respective ways.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Good progress is being made with grading work on the South Bend & Logansport interurban line. Five grading outfits are now at work and it is expected that the line will be completed from South Bend to Lake Maxinkuckee by fall. It is also said that cars will be running from Logansport to South Bend by July 4, 1911.

Trippeer & Sons, Peru, Ind., have been awarded the contract by the city of Fort Wayne for doing its portion of the track elevation in that place.

Capital is being secured for the projected traction line between Warsaw and Wabash, and it is believed that construction work will be started soon. The line will be 34 miles long. John Brubaher, Warsaw, is interested.

Costello Bros., St. Louis, Mo., have started work on their contract in connection with the laying of double tracks between Indianapolis and Anderson on the Big Four. The work will proceed rapidly from now until Oct. 15, at which time it must be completed under the terms of the contract. The work will cost approximately $1,000,000.

The Toledo-Indiana Traction Co., of Toledo, O., has increased its capital stock from $10,000 to $400,000.

According to reports the Chicago, Indianapolis & Louisville Ry., W. A. Wallace, Chicago, Ill., Division Engineer, is planning the improvement of its Louisville division to such an extent as to require an expenditure of $3,000,000. Curves will be eliminated and the air line between Chicago and Indianapolis will be placed in the finest condition.

Advices from Indianapolis, Ind., are to the effect that construction work will be started the first week of April on the elevation of tracks from Michigan to New York St. It is expected that the improvement will be completed by Oct. 31.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Work has been started on the completion of the seven mile interurban line of the Centerville Light & Traction Co., and it is expected to have cars in operation to Mystic, the terminus, by April 15. F. S. Payne, Centerville, is President.

O. P. Herrick, Des Moines, Ia., has the contract for straightening Beaver Creek in Des Moines and Beever Townships, the contract price being $38,536. J. G. Sullivan, Webster City, Ia., was awarded the contract for draining Swan Lake in Dallas Township, his contract amounting to $18,999.

Work on the proposed line for the Muscatine North & South R. R. is progressing rapidly toward Burlington, Ia. Subscriptions toward the necessary funds are coming in rapidly and $25,000 will be received from Burlington, when the road is completed to that point.

The Toledo & Tama Electric Ry. is considering extending its line at Tama for a distance of 10½ blocks.

Advices from Belle Plaine state that the Chicago & Northwestern Ry. will probably this year build the connecting link of its road between Alden and Eagle Grove. This looks probable, as the company has had the right of way for some time and if not utilized before 1911 it will revert to former owners. This line of road as now surveyed will enter the southern portion of Wright County and will probably pass through the townships of Vernon, Wall, Lake and Woolstock.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Kansas City has adopted a resolution asking the Metropolitan Street Railway Co. to extend the Quindaro Boulevard line west six blocks to the new city limits.

The contract for grading the first five miles of the Cherryvale, Oklahoma & Texas R. R. has been let to a Coffeyville contractor, and work will be started at once, running south from Caney through the northern portion of Washington County in Oklahoma to Wann. The road will be built immediately into Nowata and then southeast to Siloam Springs, Ark. The main line will pass through Bartlesville. Another line is to be built southwest through Pawhuska, Guthrie and Geary to the Red River. S. M. Porter, Caney, Kan., is President.

C. F. Propes, Nickerson, is advocating the construction of a street car line from Hutchinson to Nickerson.

Property owners along Owl Creek met at Humboldt and elected the following directors to have charge of the work of straightening out the stream: A. P. Fraker, T. C. Adams, W. R. Moore, C. E. Conklin and W. Tinch. The work will be in charge of an engineer.

Directors of the Dakota, Kansas & Gulf Ry., which proposes the construction of a railroad from Kearney, Neb., to Beloit, Kan., where a connection will be made with the Santa Fe, at a recent meeting authorized Engineer A. N. Bullitt to proceed with the permanent surveys. Carson Hildreth, Franklin, Neb., is General Manager of the company.

Business men of Raton and Des Moines, N. Mex., are promoting the construction of a railroad from Raton, N. Mex., to connect with the Santa Fe at Englewood, Kan., the western terminus of the Mulvane extension. A portion of the line between Des Moines, N. Mex., and Raton, N. Mex., has already been built. The line will pass through Liberal, Kan., and Stevens and Morton Counties. T. W. Hubbard, Liberal, Kan., is interested in the project.

The Kaw Valley Drainage District, W. H. Daniels, President, Kansas City, voted on March 22 on issuing $1,250,000 of bonds for improving the Kaw River.

Maryland Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Bill has been introduced incorporating the Elkton, Fair Hill & Oxford Ry. & Power Co., with a capital stock fixed at $60,000, which may be increased to $500,000. The company proposes the construction and equipment of an electric line from a point in Elkton, Md., to Fair Hill and Cherry Hill in Cecil County to the borders of the state line. The incorporators of the company are Dr. C. P. Carrico, George E. L. Hess, John Langren, H. Eugene Mackin and Hester Hess.

A bill is before the Legislature of Maryland for the incorporation of the Maryland & Washington Traction Co., which proposes to construct an electric railway from Ellicott City, the terminus of the Ellicott City division of the United Railways, to Laurel, the terminus of the Washington Electric Railway Co. The distance between Ellicott City and Laurel is about 12 miles. The incorporators named in the bill are Harold Hardinge, Frank O. Rappanier, James Booker Clark and James Clark.

The Washington, Potomac & Chesapeake Co. has been incorporated, with a capital stock of $500,000, and proposes the construction of a railroad from Mechanicsville to Point Look Out. The incorporators of the company are Henry W. Watson, Philadelphia, Pa., William Shippen Roney, Albert R. Roney, S. Johnson Poe and Edgar Allan Poe of Baltimore, Md.

The Western Maryland Ry., H. R. Pratt, chief engineer, Baltimore, Md., is to construct a modern classification yard at Knob Mount, south of Cumberland, on the West Virginia division, which upon its completion will represent an expenditure of about $150,000.

A bill is before the state legislature of Maryland to incorporate the Deer Creek Electric & Power Co. The incorporators are all residents of Harford county, Md., where the source of water supply will be obtained. The project is backed by E. M. Allen. The water fall at Deer Creek is said to be capable of generating about 25,000 h. p. of electrical current.

The Lansdowne & Baltimore Ry. Co. has been incorporated, with a capital stock of $100,000, and proposes the construction of a railroad from Baltimore, Md., through Westport, through Landsdowne, thence to such points in Baltimore County or Anne Arundel County as its directors may determine. The incorporators are James Rittenhouse, Henry J. Emerich, S. Newton Robinson, Jr., Charles H. Werner, W. Elmer King, Ernest E. Robinson and Charles J. Hull.

The Board of Trade of Cambridge, Md., is considering a plan of cutting a canal to connect Cambridge Creek with the Blackwater River. The head waters of this river are less than a mile from Cambridge Creek and a canal connecting the two waters would give water communication between Upper and Lower Dorchester.

A bill is before the state legislature to authorize the Maryland & Pennsylvania R. R., G. E. Norris, engineer, Baltimore, Md., to extend its line to tidewater upon any route it may acquire from its present line east of Towson to the east side of the Patapsco river.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Robert Oakman, Detroit, Mich., has completed plans for building an electric railway through the section northwest of Detroit. The line will run from the boulevard to 12th St., northerly along 12th St. to the 10,000-acre tract, thence easterly to Woodward Ave., connecting with the Detroit United's Victor and Oakland Ave. line. It will also extend northward and connect with the line of the Detroit Terminal railway. In connection with the Oakman Electric line a big factory subdivision scheme is also being worked out.

The Lake Shore & Michigan Southern Ry. is to increase the capacity of its freight house at Lansing. The improvement will necessitate the construction of considerable new siding and docks.

Petitions bearing the signatures of 18,759 voters have been submitted to the Common Council of Detroit, calling for a popular vote on the question of municipal ownership of the street railway system. Under the law 14,200 names were necessary to require the Council to submit the question to a vote.

The City Council of Bay City, Mich., has granted the Grand Trunk R. R. the franchise for which it had applied, admitting the company to the terminal site east of the river.

The Escanaba Traction Co., P. L. Utley, Manager, Escanaba, has plans well advanced for building a second power dam in the Escanaba river, and it is believed that construction work will be under way by June 1. The new dam will be located at Groos, near Bichler quarry, and it will have a 30-foot head of water sufficient to develop 2,000 H. P.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Virginia has granted a franchise for a street railway to W. M. Prindle, Duluth. Mr. Prindle already has secured the right to use the county roads for the purpose of extending the line into an interurban service between Virginia, Gilbert and Eveleth. Ultimately, it is proposed to extend the lines to Buhl, Chisholm and Hibbing.

The Duluth Street Ry. Co., of Duluth, is to begin work at once on rebuilding the Seventh avenue incline and placing a double track service on it. The improvements will cost about $25,000.

The Minneapolis & St. Paul Suburban R. R. Co. has been incorporated with a capital stock of $1,000,000, the officers of the Twin City Rapid Transit Co., of St. Paul, comprising the board of directors. While the new company was formed primarily to correct some of the features in the old articles of incorporation of the Twin City Co., it is believed in many quarters that the building of an elevated road between the twin cities is one of the objects of the company.

The Minneapolis, St. Paul & Sault Ste Marie Ry. has made a proposition to the Commercial Club of Fargo, N. Dak., to come into Fargo, providing a right of way 50 ft. wide from the Red River into the city were secured with terminal facilities 330 feet wide by 500 ft. long. The new line will come from a few miles south of Detroit, Minn., on the Winnipeg line and then run in a southeasterly direction to the main line at Enderlin.

Estimates are being made by officials of the Northern Pacific Ry., for relaying track on the old Duluth, Minn., transfer road as far as Spirit Lake, Minn. W. L. Darling, St. Paul, Minn., is Chief Engineer of the company.

Duluth and the Ranges.

BY PETER F. MEAGHER.

William Hughes, superintendent of the Missabe Southern Ry. Co., was a caller recently. He did not know whether they are going to do any construction work the coming season or not.

Barnett & Record Co. of Duluth were awarded a contract for about $100,000 worth of concrete work on one of the docks of the Pittsburg Coal Co. at Duluth, Minn. C. J. A. Morris is the engineer in charge of the work.

Martin Cane, railroad contractor, was a caller at this office recently. He is figuring on starting on some railroad work in the very near future.

A. Nelson, team contractor, was a caller at this office recently, and we had him go out to North Dakota to look at some railroad work, of which he expects to take some, and will start on the same immediately.

John O'Neal of the firm of O'Neal & Sharrock, railroad contractors on the Milwaukee, was a caller here recently. They have enough work on the Milwaukee to keep them going the coming summer.

H. J. Cooper was a caller here a few days ago. He is not doing anything at the present time, but is figuring on several jobs.

The Barnett & Record Co. of Duluth was awarded a contract by the Great Northern Ry. Co. for the concrete and piling work on a new ore dock to be constructed for this company at Superior, Wis. This contract amounts to about $350,000. The Barnett & Record Co. was also awarded a contract by the Duluth & Iron Range Ry. Co. for an ore dock to be erected at Two Harbors, Minn.

Greer Thompson, general manager for the Drake & Stratton Co., was a visitor with us this week. He had just returned from a trip over its various contracts in the east and said he had quite a bit of work and expected a very busy season.

C. J. A. Morris of the contracting firm of Morris & Shepard, Globe Bldg., St. Paul, Minn., was a caller at this office. He has been in the city for the last few days. Mr. Morris is a very busy man at the present time, having three docks under way at Duluth and Superior and besides has about 75 miles of railroad work for the Great Northern R. R. in North Dakota. They were just awarded a few days ago 35 more miles and have some excellent grader and team work to let, and are looking for sub-contractors with outfits of that kind, who would like to get a full season's work. They are offering very nice prices, and the section of the country that they are working in is a very good one in which to work, and any sub-contractors looking for work will do very well to communicate with them.

Arthur Mitchell, general superintendent for the MacArthur Brothers Co. in this section, spent Saturday with us last week. They are rushing their two stripping contracts as fast as possible, and will continue to work both night and day shifts on the same until completed.

Horace Clark, representing the Macomber & Whyte Rope Co., was a caller at this office a few days ago. He left here to make a trip to Kansas and the southwest.

John Runquist, Duluth railroad contractor, received a new Model 60 Marion steam shovel the other day and has put it to work with a 3½-yd. car outfit on one of his contracts for the Duluth & Missabe Northern Ry. Co.

John R. Davis, one of the old time contractors, was a visitor with us this week, and left for North Dakota to look over some work on the Great Northern for Morris & Shepard, and I believe that he will take quite a piece of it.

Patrick McDonnell, Duluth contractor, was awarded a large paving contract by the city of Grand Forks, N. D., and will start on the same immediately.

W. F. King, a Duluth concrete contractor, is very busy at the present time putting in the large concrete abutments for the bridge that is being constructed to the site of the new United States Steel Co.'s steel plant that is going to be erected at Duluth.

Dale & Bumgardner, steam shovel contractors on the Soo line, at the present time have three steam shovels working full blast and have enough work to keep them busy for some time to come.

C. E. Jamieson, who is working on the Soo line, was a caller a few days ago. He was on his way to the woods to get some of his horses that he has had working there all winter. He has got enough work to keep him busy for the next two or three months.

The labor situation in Duluth and vicinity at the present time is in a very good condition. There is quite a bit of work going on of various kinds, and quite a few men are here. Work is opening up very rapidly in this section, and the surplus of laborers that we have here at the present time will not last very long. The wages being paid for common laborers run from $1.75 to $2 per day.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Capt. F. W. Latimer, Galesburg, Ill., President of the Hannibal & North Missouri Interurban R. R., has accepted the proposition of the Commercial Club of Hannibal, relative to the extension of the line from Palmyra to Hannibal. According to the agreement the Commercial Club is to dispose of $40,000 of stock.

Plans are reported to have been prepared by the Springfield Traction Co., of Springfield, for the construction of a complete belt line running along Commercial, Broad, Nichols, Center and Oak Sts., and encircling practically all of the residence section of the city between Commercial and Center Sts.

The Missouri Interurban Ry. Co. which proposes to build an interurban line from Sedalia to Prairie Home, Mo., has effected its permanent organization as follows: President, A. W. Nelson, Bunceton; Vice-President, Frank Gemender, Cedro; Secretary, J. W. Mellor, Sedalia; Treasurer, E. W. Moore, Kansas City, Kan.

The Illinois Traction System, H. E. Chubbuck, General Manager, Peoria, Ill., is having plans prepared for the construction of its proposed terminals in St. Louis. The plans involve the expenditure of about $1,000,000 and include the construction of a main building 4-story, 70x70 ft., of brick, stone and iron construction, with a 148x150 ft. train shed. Trackage arrangements will also involve a considerable expenditure.

Right of way has been secured to Monett for the projected interurban line from Mount Vernon to Springfield and Carthage, promoted by F. C. Yentsch, of Mount Vernon. As now contemplated, the route will run west from Springfield to Paris Springs, Lawrence County, and to Mount Vernon, thence southwest to Hoberg, Freistatt and Monett, thence in a west and northwesterly course through Pierce City, Wentworth and Sarcoxie to Carthage.

It is now said that the Chicago, Burlington & Quincy Ry. will have work started in the near future on its extension from Mexico, Mo., to Kansas City. The plans are said to provide for an extension from Mexico to Macon, where it will connect with the route already there, while the other extension will run from Mexico to Kansas City, passing through Renick, Salisbury and Carrollton.

The Chicago, Milwaukee & St. Paul Ry. is considering an expenditure of $1,250,000 for the improvement of the Kansas City Division. D. J. Whittemore, Chicago, Ill., is Chief Engineer.

An ordinance is before the City Council of Kansas City to revive the grant of the Kansas City Interurban Ry. for a freight line and switch yards in the residence parts of the Brush Creek Valley.

W. E. Talley, President of the State Bank, Springfield, Mo., and owner of the "Sawdust" Central R. R., is considering the extension of his line from a point on his property to Senath, Mo., to connect with the St. Louis & San Francisco Ry.

J. B. Houseman, Engineering Contractor, has gone over the route of the proposed railroad from Spanish Lake to Jefferson Barracks, Mo. Promoters of the project believe it feasible.

Grade stakes for the projected line of the St. Joseph Heat, Light & Power Co. have been set as far as Savannah, and it is said that grading work will be started April 1. John H. Van Brunt, St. Joseph, is interested.

St. Louis Items.

BY A. B. KOENIG.

S. L. Powers, brother of the Louisville banker, J. D. Powers, is promoting an undertaking for the construction of a short line between St. Louis and Fort Smith. He said entrance to St. Louis may be obtained either on the Terminal tracks or on the tracks of the Manufacturers' Railway. Surveys for the new line have been made. A road is projected to connect with the Frisco or the Iron Mountain. If this plan fails, a new line all the way from Fort Smith to St. Louis is proposed. Mr. Powers has made considerable progress with the project.

Citizens of Gainesville, Texas, with $100,000 paid up capital, have organized the Gainesville, Oklahoma & Western Railroad. The charter provided for a line from Gainesville to Coalgate, Okla., thence southwest to the Fort Worth and Denver connection. A. E. Perry, representing Coalgate interests, is pushing the project.

The Lucin cut-off across Salt Lake is to be double-tracked at once. It calls for an outlay of $1,500,000.

The L. J. Smith Construction of Kansas City have put on five more gangs of 100 men each on its ballasting work on the Mo. Pac. R. R. in Kansas and Colorado.

R. C. Stripp auditor of the L. J. Smith Construction Co., passed through St. Louis last Saturday on his way to Kansas City from Arkansas.

J. A. Perdue of Pine Bluff, Ark., secured the contract for grading four miles of Fernwood & Gulf Railway out of Tylertown, Miss.

Callahan Construction Co., Empire Bldg., Knoxville, Tenn., has 27 miles of scraper, mountain rock and shale work on the L. & N. extension out of Harlan, Ky., to let. It has free transportation for outfits over the L. & N. R. R. from Louisville, Memphis, Birmingham and Atlanta. E. R. Keller, its general

superintendent, will be ready to sublet this work in quantities to suit outfits and will open an office at Harlan, Ky., on March 28.

Hickey Bros. secured the contract to do the concrete and bridge work on the new Big Four extension in southern Illinois and Indiana.

J. W. Skinner has secured all of the bridging and pile driving work on the Big Four R. R. from Mt. Carmel to Evansville from Hickey Bros.

Frank Skene and W. R. Hughes are going to do concrete work on the Big Four R. R. extension. They secured this work from Hickey Bros.

The Federal Commissary & Supply Co., of which Chas. A. Truitt is president and treasurer and L. E. Mitchell is secretary, has increased its capital from $20,000 to $50,000, all fully paid.

Sam A. McCoy of Boynton, Church & McCoy writes us from Billings, Mont., that they have some good work to let at that point.

Quite a large number of new street contracts are to be let by the city here in the fore part of April.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

A bill is before the State Legislature authorizing the city of Buffalo to issue $750,000 of bonds for the purpose of raising money to construct bridges and to construct, reconstruct and make extraordinary repairs to structures erected in pursuance of agreements made between the grade crossing commissioners and railroad companies.

The Maryland Dredging Co., which has barge canal contract No. 29 near Utica, is planning to begin dredging work in the near future. The company has constructed five new houses at the scene of their operations, for the accommodation of carpenters, foremen, engineers, etc. Another and larger structure will be erected for the great number of Italians to be employed. D. L. Taylor is in charge of the Utica work.

The Delaware, Lackawanna & Western R. R., D. J. Ray, Chief Engineer, Hokoben, N. J., has received bids for building a 5-mile cut-off between Henryville and Analomink on the Pocono Mountains. The cut-off will eliminate a number of sharp curves and the job, it is estimated, will cost about $400,000. The work includes the building of an arch 85 ft. high to span the Broadhead Creek. The arch will contain about 14,000 yards of concrete. The distance between Scranton and New York will not be decreased by the improvement, as it will mean the cutting out of several heavy curves now existing between the two points and the putting in of a greater number of slight curves.

The Corning & Painted Post Street Ry. Co., Howard Royal, Superintendent, Corning, is to extend its Bridge St. line to the New York Central yards and shops at North Corning this spring, also running past Sebring Park.

James G. Hayes and Quay A. Stumpf, both of Big Run, Pa., and Slyvanus D. Ward, of 63 Wall St., New York City, have taken out incorporation papers for the J. G. Hayes & Co., of Syracuse, and will engage in a general contracting business. The capital stock is $10,000.

The Village Trustees of Freeport, L. I., have granted a franchise for the South Shore Traction Co. to run a trolley line through that place. This is practically the connecting link between Patchogue and New York, and now that this consent has been given the line will be rushed to completion.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Toledo & Ohio Central R. R., J. A. Stocker, Chief Engineer, Toledo, is planning to begin work April 1 on its grade separation work at Columbus. The work includes the elevation of the Ohio Central and Hocking Valley tracks over six streets and two alleys, and the erection of an elevated structure at Broad Street for use of passengers as soon as the tracks are raised. The elevation of the Broad Street station will be about 12 ft.

The Lake Shore Electric Ry. Co. has applied to the County Commissioners at Sandusky for a 25-year franchise which will permit it to lay its tracks over the new bridge to be erected over the Huron River at Huron.

The Marietta, Columbus & Cleveland R. R. is planning to construct a 11-mile connecting link between Amesville and Athens. Final surveys for the line are reported to have been made by G. S. Leavenworth, Troy, N. Y. J. C. Riddell, Marietta, is General Manager.

It is now said that a new syndicate has taken hold of the Galvin Southern and will have construction work started in the near future. The line is to extend from Galvin to Mount Vernon and was projected a number of years ago. The entire right of way has been secured. Gasoline motor cars are to be used.

The Maumee Valley Railways & Light Co., of Toledo, is said to be considering the project of abandoning the Waterville branch of the road on the Lucas County side of the river above Maumee, and building up the river on the Wood County side, extending it to Haskins, O., with a spur across the river at Waterville.

The Lake Shore & Michigan Southern Ry. is said to be buying additional land along the portion of the high grade J. & F. branch between Dorset and Andover for an additional track.

Work will be commenced at once, it is said, on the double tracking of the Chesapeake & Ohio R. R. from Cincinnati, O., through to tidewater, Newport News and Norfolk. The work will require nearly all the $5,000,000 appropriation. F. I. Cabell, Richmond, Va., is Chief Engineer, M. of W.

The Cleveland Ry. Co., John J. Stanley, vice President, Cleveland, O., is stated to have decided to make extensive betterments to its entire system in Cleveland.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

All the property of the Altus, Roswell & El Paso R. R., now being constructed west from Altus, Okla., across the Texas Panhandle to Roswell, N. Mex., has been transferred to the Wichita Falls & Hollis Ry. Co. Practically all of the right of way between Altus and Hollis is ready for steel and all the bridges have been built. The Altus, Roswell & El Paso Ry. was organized and chartered two years ago by E. E. Kennedy of Abilene, Tex.

A state charter has been issued to the Arbuckle & Western R. R. Co., with authorized capital stock of $100,000, and headquarters at Ardmore, to build a line 110 miles in length between Ardmore and Chickasha, and a branch from Milo, near Ardmore, to Lawton, 80 miles. The estimated cost is $16,000 per mile. The directors are Oscar O. Ayers, J. A. Bivens, J. R. Pennington and R. A. Hefner of Ardmore and Emory S. Ayres of Edgington, Kan.

The City Council of Stillwater has granted a franchise for an electric railway system in this city to New York capitalists. According to the terms of the franchise work is to be started within 18 months.

The Commercial Club of Okmulgee has appointed a committee to confer with the Frisco officials with regard to the building of the proposed Fayetteville-Shawnee R. R. through that city. The road is to be built from the Arkansas town to Shawnee through Muskogee, and will tap the oil producing region of the state. Okmulgee is almost in the line of the survey for the road, and wants the road to enter that city.

The matter of constructing the Rock Island branch from Chattanooga, Okla., through Grandfield and Southwest Texas is to be placed before the directors of the company. The line has already been located and right of way procured. W. S. Tinsman, Chicago, Ill., is General Manager of the company.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

T. J. Miller, New York City, is stated to be promoting a project for the construction of an electric railway from Ashland, Ore., to Klamath Falls and the interior of Southeastern Oregon. The power for the new line will be furnished by Klamath Falls. The road will tap one of the most fertile districts of Eastern Oregon and one that has not at present any railroad facilities.

The annual budget of the Portland Railway, Light & Power Co. of Portland is said to provide about $4,500,000 for improvements this year. The main items are as follows: For street improvements and track reconstruction made necessary by city work, $1,020,000. For other track extensions and improvements, $200,000. For new equipment, $600,000. For new buildings, car barns, etc., $110,000. For work on power plants and substations under way, $1,250,000. For new light and power installations, $400,000. The balance of practically $2,000,000 will cover additions to power plants, work on sub and transformer stations, conduit transmission systems, machinery, and miscellaneous betterments in the light, power and railway departments. The street improvement and track reconstruction items apply to 60 different streets throughout the city, the length of the improvements varying from one block to two miles. The largest single item is $60,000.

Announcement has been made by J. H. Wilcox, of Portland, one of the incorporators of the Hood River Electric Light & Power Co., that active work will begin shortly on the proposed electric railroad. The new company has secured an option on the power site of the Hood River Power Co., and is also negotiating for other power interests there.

F. L. Smart, W. L. Chrisman and Charles N. Barrett, of the United Public Utilities Corporation of Philadelphia, Pa., which is financing the construction of the proposed electric road from Astoria to Seaside, are now in Astoria reorganizing the working forces, so that construction can be rushed this coming summer.

The City Council of The Dalles has granted a franchise for an electric railway to E. W. Thomas, of Philadelphia, Pa., who has announced that track laying will be commenced in the near future. Gasoline motors will be used at first.

A syndicate has purchased a tract of 61 acres in the Portland Heights addition to the city of Portland, and will develop it for building purposes. The improvements to be made include hard surface for every street, curbing, grading, sidewalks, sewers and water on every site, underground wiring, lighting the entire tract with cluster street lights, and other improvements. It is also said that the syndicate will build a street car line up Washington St. to serve the new tract. Dr. J. R. Wetherbee, Portland, Ore., is interested.

The Utah Construction Co., Ogden, Utah, has over 1,000 men employed on its contract for grading for the Oregon Eastern R. R., which is building a line to Klamoth Falls.

The Commercial Club of Prineville has taken up the matter of a railroad from the main line to Prineville. A committee has been appointed to procure data and confer with the lines now under construction.

The Coast Construction Co., with principal offices at Portland, Ore., has been incorporated with a capital stock of $10,000. The incorporators of the company are W. B. Scott, T. A. McDougall and F. H. Deshon.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The West Penn Rys. Co., Pittsburg, is shortly to begin work on a number of extensions in Western Pennsylvania. Among these is the proposed connection of the gap between Scott Haven, the terminus of the company's Yough valley line, and Hunker, on the main trunk line. This link will be completed, it is said, within the next 18 months, and during the present year West Newton will have connection with Greens-

burg, the county seat, by trolley via Hunker. Nearly all the right of way has been secured.

The City Council of Altoona has passed the ordinance granting a franchise to the Johnstown & Altoona Ry. Co. to enter the city. The company is to build an electric railway between Altoona and Johnstown and has obtained all the rights of way. Work will begin at once.

The Pennsylvania R. R. is planning to double track the Bald Eagle Valley R. R., which extends from Tyrone to Lock Haven. The work will include a number of changes at Eagleville, where a big curve and hill are to be eliminated. This will necessitate the construction of a number of deep cuts.

Residents of the west end at Williamsport have made a proposition to the Williamsport Passenger Ry. Co. for an extension of the tracks on West 4th St. for a distance of one mile.

Advices from Johnstown quote Superintendent F. R. Newman of the Southern Cambria Ry. Co. as stating that the company expects to begin work this spring on the construction of its line from South Fork to Ebensburg.

Willis E. Gray, of North East, Pa., has been engaged by New York capitalists to superintend the construction of a new railroad in the republic of Mexico.

The Pennsylvania R. R. Co. has completed the construction of its Midland railroad from Altoona to Bedford, Pa. This line gives Altoona a direct connection with Cumberland, Md.

Plans have been completed by the Baltimore & Ohio R. R. for the construction of improvements at Butler, Pa., and vicinity. The work will include the elevation of tracks and the construction of a passenger station and is estimated to cost in the neighborhood of $80,000. Work, it is said, will be started in about two weeks.

The governor of Maryland has authorized the Western Maryland to issue the balance of its unissued stock, amounting to approximately $26,000,000, below par for the purpose of building the new extension from New Haven, Pa., to Connellsville. H. R. Pratt, Baltimore, Md., is chief engineer of the company.

The Kistler-Lesh Co., Lock Haven, Pa., has secured a charter under the name of Rockfish Valley Ry. Co. and proposes the construction of a railroad from the Southern Ry. into Nelson and Albermarle counties. The officers of the company are Sedwick Kistler, Lock Haven, Pa., president; W. O. Bentley, Lock Haven, vice president; J. T. Coleman, Jr., Lynchburg, Va., secretary.

Surveys have been completed and right of way is now being secured for the proposed extension of the Northern Electric Railway Co. from Factoryville, Pa., to Binghamton, N. Y. As projected the line would run northeast from Factoryville through Lackawanna county to the town of Royal in Susquehanna and then describe a ziz-zag route northwardly through South Gibson, Jackson, Brushville and intervening villages, finally curving toward the northwest, as it approaches the New York state line to reach Binghamton.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boosters Club of Greenville, John H. Erickson, Secretary, has entered into an agreement with H. J. Meyers, of Dayton, O., and associates, for the installation of a street railway system in Greenville. The agreement provides for the construction of not less than five miles of standard gage 70-lb. T rail track. track.

The company projecting the Denton-Fort Worth Interurban line met recently at Denton, and perfected its formal organization, with the election of A. C. Owsley, J. C. Colt, B. H. Davenport, W. B. McClurkan, J. N. Rayzor and B. W. Blewett as directors, and A. C. Owsley, President; W. B. McClurkan, Vice-President; H. F. Schweer, Treasurer, and C. E. Scruggs, Secretary.

Construction work has been started on the interurban line from San Benito. The steel for the line has been ordered and contracts for ties placed, Ismael Montaloo and Luis Ramsey, of San Benito, receiving the contract for furnishing 20,000 ties each. The Hidalgo Construction Co. has the contract for grading, bridging and tracklaying. Ward Carpenter, who has charge of the concrete construction of the San Benito Land & Water Co., will have charge of the construction of the road. S. A. Robertson, San Benito, is interested.

R. L. Frisbee, C. E., Austin, is promoting a project for the construction of a line of railway from Beeville to Eagle Pass, through the counties of Live Oak. McMullen, La Salle and Dimmit.

The Dumont-Holmes Steel Concrete Co., of Chicago, Ill., has been granted a permit to do business in Texas. J. C. Dumont, the head of this company, has submitted a proposition to the city of Austin to put up a $1,000,000 concrete dam on the side of the granite dam across the Colorado River above the city which was washed away some years ago, and has deposited earnest money to the amount of $10,000 as an evidence of good faith. The question of accepting his proposition will be submitted by the city commission to the people of Austin to be voted upon. He proposes to replace the dam and establish a water and light plant system in connection therewith for a series of semi-annual payments of $25,000 each to continue for 20 years. He agrees to furnish the city with water and light free during that time but requires that he be in the meantime given control of the city's water and light system.

C. D. Johnson, of the firm of Frost-Johnson Lumber Co., of St. Louis, Mo., has closed a deal whereby his company acquired the Nacogdoches & Houston R. R., and property of the Hayward Lumber Co. The timber holdings and mills of the lumber company are valuable acquisitions while the railroad is standard gage, 20.1 miles in length, five of which were completed last fall. The terminals of the road were Nacogdoches and Oil City, but within the past few months the road has been extended a distance of five miles. Connections are made with the Houston, East & West Texas at Nacogdoches and with the Texas & New Orleans at Hayward.

The Kansas City, Mexico & Orient R. R. Co. has made application to the State Land Commissioner to purchase 240 acres of land, situated in the valley of the Rio Grande, near Presidia del Norte, where the international boundary stream will be crossed by that road. It is stated that the road will lay out a town upon the land and establish extensive terminals there. The Mexico division of the road is now being built up the Conchos Valley from Chihuahua to connect with the main line under construction through Texas. W. W. Colpitts, Kansas City, Mo., is Chief Engineer.

Good progress is being made with organization work for the beginning of construction on the Gulf Coast & Provident City Ry., recently chartered for the purpose of building a railroad 35 miles long from Waterhouse, on the Santa Fe, to Provident City, in the western portion of Wharton County, via Pierce, on the Southern Pacific.

The Artesian Belt Ry. has been graded 15 miles south of Christine, the present terminus, and the balance of the road to the Rio Grande will be constructed in a straight line. Dr. C. F. Simmons, San Antonio, is President.

The Bryan & College Interurban R. R. Co., which filed its charter on March 21, has its entire line graded and steel has been shipped. It is intended to have the line in operation early in June. The road will be 6½ miles long and will connect the city of Bryan with the A. & M. College. The line will be operated with gasoline motors, but electric power will ultimately be installed. The incorporators of the company are: W. H. Hunter, Crowley, La.; O. E. Gammill, W. E. Saunders, J. K. Parker, G. S. Parker, H. O. Boatwright, J. W. Doremus, J. E. Butler, J. T. Maloney, J. W. English, L. L. McInnis and A. W. Wilkerson of Bryan. Civil Engineer White, of Bryan, who had charge of surveys for the road, has started surveys for a new railroad from Bryan to the Brazos bottom. The road will tap the International & Great Northern at Smetena, six miles west of Bryan, and the tracks of that road will be used into Bryan. It will cross the river at Pitts bridge and run down the bottom, taking in all the big farms in the levee district.

The contractor on the Santa Fe extension from Lometa to Brady has moved his camp from Rochelle to the San Saba River in San Saba County, a distance of about 25 miles, and has begun grading from that point westward. Some of the sub-contractors on the Frisco who have completed their contracts have taken grading work on the Santa Fe line. All indications point to a rapid pushing of the work of extending the Santa Fe from Lometa to Brady, and probably westward through Concho County.

J. C. Kelso, Galveston, has been awarded the contract for grading 16 miles of right of way for the Houston-Galveston Interurban Co., reaching from a point two miles below Texas City Junction to Clear Creek. A contract for a like distance nearer Houston will be let in the near future. The work is what is known as embankment work and will average from 2 to 5 ft. higher than the surrounding land. The contract includes all ditching and grading. Contracts for 120,000 ties were also let, part for immediate delivery and the bulk for delivery beginning May 1. The road is being built by the Stone & Webster Engineering Corporation, under the direction of J. B. Townsend, engineer, First National Bank Bldg., Houston.

Work is progressing rapidly on the Santa Fe cutoff from Coleman, Tex., to Texico. Practically all grading has been completed from Coleman to Sweetwater, a distance of 85 miles. Steel has been laid on 25 miles of the line from Coleman to Jim Ned Creek, where a steel bridge 375 ft. in length and 115 ft. in height is being constructed.

It is said Chicago capitalists are promoting the construction of a railroad from Mineola to Paris, Tex., by way of Winnsboro and Mount Vernon, Tex.

Right of way has been guaranteed for the construction of the proposed Denton-Fort Worth interurban line from the Tarrant County line to Fort Worth, Tex. Stockholders are to meet soon at Denton, Tex., and elect officers and directors. President Owsley, Chamber of Commerce, Denton, Tex., is interested.

The Palacios, San Antonio & Pecos Valley R. R. Co. has been organized at Palacios, Tex., with a capital stock of $100,000 and proposes the construction of a line through territory not provided with transportation facilities.

The American Central Ry. Co.'s crew is running preliminaries for the first section of the proposed line between Miami and Vernon, Tex. As proposed the line will intersect the following roads: The Choctaw branch of the Rock Island at Texola, Mangum branch and the Wichita and Northwestern at Mangum, Okla.; the Orient at Olusta, and the Denver at Vernon, Tex.

W. L. Carwile, Pecos, Tex., president of the Pecos Valley Southern Ry., has filed his bond for $25,000 guaranteeing the construction of the proposed road with the trustees. Grading has already been started and Chief Engineer Anderson is planning for the construction of bridges, stations, etc., along the line and for shops at Pecos, Tex.

Citizens of Robert Lee, Tex., are taking steps to raise the necessary bonus to secure the construction of the proposed line from Colorado City to Robert Lee. After this section of the line is secured it will be extended to San Angelo, Tex.

The officials of the Kansas City, Mexico & Orient Ry. have signed a contract with the citizens of Del Rio for tne extension of the line 151 miles south from San Angelo to which point it is now built.

Advices from San Antonio state that the railroad that was being constructed between Gardendale, on the I. & G. N., and Carrizo Springs, by the Hust & Brundage Co., has been sold to J. E. Franklin of the Bankers' Trust Co. of St. Louis, and the work will be rapidly carried to completion. The Bankers' Trust Co. built and owns the Uvalde & Crystal City R. R., which is now extending its line from

Crystal City into Carrizo Springs from the north. The new road has been graded for nine miles and will be known as a connection of the Uvalde & Crystal City railroad, extending from Gardendale to Brundage, a distance of 45 miles.

The North American Dredging Co., of Galveston, started work Mar. 23 on its contract for the first section of the Houston-Galveston interurban line. This section of the work is 2.6 miles in length, reaching from the causeway to the city limits of Galveston on Galveston island. This job is a strip 150 ft. in width, of which 50 ft. is for the interurban and 100 ft. for the county roadway. The contract calls for a hydraulic fill and embankment roadway, which will run through the low bed of the island. Sand will be pumped from Moffat's bayou, bringing the roadbed ten feet above zero datum, which will be higher than any present railroad embankment. The dredging company intends to pump about 10,000 cu. yds. per day until the 250,000 or 300,000 cu. yds necessary to complete the first section are filled in. The contract for the second section has been let to J. C. Kelso as stated elsewhere in this column.

J. K. Hexter, F. B. Lander, J. N. Fagan, V. A. and A. A. Sitterle, all of Victoria have applied to the City Council of that city for a franchise for a street railway to use either electric or gasoline motor cars. It is the promoters' intention to have the line in operation from the main part of town to the ball park by April 21, when the ball season opens here. The line probably will be extended to the eastern and northern suburbs of the city.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ogden & Northwestern Ry. Co., of Ogden, has accepted the franchise granted it by the Commissioners of Box Elder County. The franchise gives the railway company the right to construct a trolley car line from the Ogden Hot Springs to Brigham City. The terms of the franchise are that the building of the road must begin within six months' time, and be completed within one year. Announcement has been made that the work of extending the trolley line already running to the Hot Springs would begin at once. The road will follow the open tableland at the base of the mountains, and little or no engineering difficulties will be encountered.

The Commissioners of Salt Lake County have been notified by the Utah Light & Railway Co. of Salt Lake City that it will extend its line from Murray to Sandy, and that it expects to have the extension in operation this summer.

The Southern Pacific R. R. is to expend about $500,000 in double tracking and raising the trestle across the great Salt Lake between Ogden and Lucin. An appropriation of $300,000 already has been made for this purpose.

The Sunnyside Reservoir Irrigated Land & Livestock Co. has filed application with the State Engineer at Salt Lake City for 1,600 acre-feet of water from the Cottonwood wash, in Carbon County. The company plans to operate near Sunnyside as soon as a reservoir can be constructed.

The Sego Irrigation Co. has been incorporated with a capital stock of $40,000 and headquarters at Provo. The directors and officers are James Clove, president; C. E. Loose, vice president; Preston Peterson, secretary; W. L. Biersach, treasurer, and A. L. Woodhouse.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Advices from Spokane state that work will probably be started shortly on the projected line of the Big Bend Transit Co., from Spokane to the Columbia River. A. W. Turner, Davenport, Wash., is General Manager.

The Valley Construction Co., of Kenewick, has been incorporated with a capital stock of $50,000, the incorporators being O. L. Hanson, D. F. Hildebrand and J. H. Knight.

The Great Northern, according to current reports, is considering an expenditure of $2,500,000 for the improvement of its line in the state of Washington during 1910. The line through the Cascade Mountains will have a 500-ft. right of way cleared of timber and rocks. A. Stewart, Seattle, Wash., is assistant chief engineer of the company.

Directors of the Northern Pacific Ry. Co. have notified the secretary of the state of Washington that the Sunnyside branch line will be extended to tap the principal cities in Yakima and Benton counties. A. Stewart, Seattle, Wash., is assistant chief engineer.

Location surveys are being made by engineers of the Great Northern Ry. for the construction of a line from Oroville, Wash., to Penticton, B. C. It is expected that construction work will be started on this line this summer.

According to announcement reported to have been made by A. H. Hogeland, St. Paul, Minn., chief engineer of the Great Northern Ry., steel will be laid on 20 miles of the new Oroville-Brewster extension by the end of April.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The City Council of Stoughton has granted an extension of six months in the franchise of the Cincinnati Construction Co. The company expects to build an interurban line from Madison to Janesville this season, beginning May 1.

The Canadian Pacific Ry. is reported to have acquired a block of property in Milwaukee near Lake Michigan to be used as a terminal. With the Milwaukee acquisition the Canadian Pacific would have a Chicago line from the head of the lakes, with which Milwaukee would be directly connected. Surveys have already been made for a new route through Milwaukee.

M. Fugina and C. Schmoke, Fountain City, are purchasing swamp land in the Trempealeau bottoms near Trempealeau, with the object of reclaiming the land by drainage. About 10,000 acres of land will be affected and it is planned to build a levee, two drainage ditches and to erect a pumping plant.

The Milwaukee Western Electric Ry. Co. of Milwaukee has increased its capital stock from $200,000 to $1,000,000 for the purpose of building its proposed line this summer.

The town board of Oak Creek, Wis., has adopted resolutions endorsing the petition to the State Railroad Commission for the elevation of the railroad tracks on the south side.

The Crocker Chair Co., of Elton, is to have surveys started at once for a railroad from Elton north and into the timber lands of the company in the town of Langlade.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. Y. Macdonald, City Solicitor, of Regina, Sask., has been preparing an ordinance to grant a franchise to a company which proposes the construction of a street railway in Regina. Eight miles of track will be laid in the city this year, and arrangements will be made for the construction of a number of suburban lines, on which the work will be done in later years.

The Canadian Pacific Ry. is said to have acquired the interests of the Alberta Central Ry., with the idea of getting an easier grade across the Rockies, than the Kicking Horse pass affords. It is said work on this new line will be commenced this spring. It will run eastward from the coast to Red Deer, and thence to Saskatoon.

The Great Northern Ry. has location surveys under way for its line from Orville to Penticon, B. C. The line will be about 40 miles long and will probably be constructed this year.

The city of Sherbrook, Que., has granted a franchise to the Sherbrook Ry. Co. In return for the franchise the company promises to extend the system more than double what it is now, and will spend $500,000 in extensions and development of power plant. The company has an option on the water power of the Magog River, which runs through the city. Montreal capitalists are behind the scheme, and it is said that the system at Sherbrook will make connection with the proposed electric railway throughout the townships, starting from Montreal.

George Attwood, Prince Albert Sask., Chief Engineer of the Hudson Bay & Pacific Ry., has started surveys for the projected line from Prince Albert to Fort Churchill on the Hudson Bay. It is planned to have construction work started as soon as this survey is well advanced. The charter under which the road is to be constructed is an old one, but it has been renewed. It calls for the construction of 1,600 miles of railway from Prince Albert to Edmonton; to Lake Athabasca; and from Prince Albert to Fort Churchill. The project is being financed by the Hudson Bay & Pacific Railway Development Co., and J. A. Taylor & Co., New York, N. Y., are said to be largely interested in the enterprise.

The Dominion Minister of Railways has approved the route of the Alberta Central Ry. from Red Deer westerly to Rocky Mountain House. Plans and profiles have been prepared and it is believed that the line will be constructed by Dec. 1. J. Grant MacGregor, Red Deer, Alberta, is Chief Engineer.

Railroad contractors are taking advantage of the exceptionally early advent of spring and by the end of this month grading work will be commenced on the several lines in the Edmonton end of Alberta. Phelan & Shirley of Omaha, Neb., contractors for 80 miles of the extension to the main line of the Grand Trunk Pacific west of the Macleod River, have already commenced grading and within the next few weeks will bring several large outfits up from Omaha, where they have been employed on the extensions to the Union Pacific, and will put them to work west of the city. The Canadian Northern R. R. is also arranging for further construction on its branch into Calgary from Camrose, which is to be completed into the southern city this year. J. D. McArthur of Winnipeg, who has the contract for the completion of the Grand Trunk Pacific branch from Tofield into Calgary, this year, is also arranging to get his sub-contractors to work at a very early date.

The Canadian Pacific Ry. has just awarded a number of contracts for work in western Canada, Foley, Welch & Stewart, Stony Plain, Alberta, and St. Paul, Minn., and J. D. McArthur, Winnipeg, getting the bulk of the contracts. In the farther west most of the new work of the year will be done by Foley, Welch & Stewart, and near to Winnipeg it is expected that almost all the contracts will go to J. D. McArthur. Already a number of important contracts have been awarded to these two firms. In Alberta the Kipp extension will be built by Foley, Welch & Stewart. This line has been completed to the Little Bow River. It is now proposed to extend it from Carmangay to a point southeast of Calgary. Next year the line will be continued until a junction is effected with the Calgary-Macleod branch. The extension of the Langdon branch will also be built by the Foley, Welch & Stewart firm. This extension or spur leaves the Langdon branch at Irricanna and runs in a southeasterly direction, the intention being to afford facilities to the large numbers locating in the irrigation belt. The Weyburn extension will be built by the J. D. McArthur company and the expectation is that this company will remain on this work for several years, until the line is built through towards Lethbridge. Only 25 miles of the dump will be completed this year. The J. D. McArthur Co. will also build the Outlook extension. This is a 90 mile job, the work beginning on the north side of the Saskatchewan and continuing until the point is reached where the road branches off to Macklin. The contract for the line from Regina to Colonsay, 110 miles, was let to J. Bradley.

It is expected that entire section of the main line of the Grand Trunk Pacific between the McLeod River and Tete Juane Cache, a distance of 180 miles, will be under construction early this coming summer. Foley, Welch & Stewart, the contractors, have already sublet about 75 miles of the work in the McLeod district. The contractors have devoted the

past winter to packing in supplies by sleigh to points along the route as far west as the summit of the Rockies at Yellowhead Pass. Tete Juane Cache is 50 miles further west, and is on the Pacific slope.

The Canadian Northern Ry., M. H. MacLeod, general manager, Winnipeg, Man., is to shortly take bids from contractors for the building of portions of its line between New Westminster, B. C., and Hope, the latter at the western slope of the Hope mountains. Construction will also be carried on this summer at the various points between Kamloops and Hope, the route from Lytton following the Fraser River on the side opposite that occupied by the C. P. R. R.

A. Kirk, Antigonish, N. S., has been awarded the contract for the construction of a branch line of the Intercolonial Ry. some ten miles long, from George's River to Sydney Mines, Cape Breton. The contract is said to amount to about $250,000.

Work has been started at Papineauville, Can., on the construction of the proposed Little Nation River Ry., which is to run from Papineauville to Nominingue towards the northerly part of Labelle County, connecting with the Canadian Northern Ry. at Arundel. G. W. Seguin, city collector of Ottawa, Ont., is president of the company.

Information has been received by T. H. White, Vancouver, B. C., chief engineer of the Canadian Pacific Ry., stating that surveys have been completed between Tete Juane Cache and Yellowhead Pass at the summit of the Rockies. This completes the preliminary survey for the entire line between Yellowhead Pass and New Westminster, a distance of 450 miles.

The Canadian Pacific Ry., which controls the New Brunswick Southern Ry. between St. John and Calais, Me., is planning to straighten the road and to extend it to a junction with their main line at Mattawamkeag. J. G. Sullivan, Montreal, Que., is assistant chief engineer, Canadian Pacific Ry.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Chapala Hydro-Electric & Irrigation Co., of Guadalajara, Mexico, has plans for a direct trolley line between Guadalajara and the town of Chapala. Surveys were completed several months ago.

Arrangements have been made with the National Ry. of Mexico, Jas. M. Reid, Chief Engineer, City of Mexico, for the construction of a branch from La Capilla, a station on the main line of the Guadalajara division, 20 miles from Guadalajara, to the town of Chapala, on the northern shore of Lake Chapala. The distance is less than 25 kilometers. The state government will secure the right of way and bear the expense of preparing the roadbed.

Plans are said to be under way for securing the necessary capital for the extension of the Pan American R. R. through Guatemala and also the construction of a branch line into the interior of the State of Chiapas, and probably into the States of Tabasco and Campeche. David E. Unger, Gamboa, Oax., Mexico, is Chief Engineer.

Governor Damian Flores of the State of Guerrero has just granted the Mexican Pacific Ry. Co. a subsidy of $4,000 per kilometer on about 175 kilometers of track that will be built between the port of Acapulco and the port of Zihuatanejo. This state aid is supplemented by a liberal donation of land for terminals and right of way. The survey for the proposed road has already been made, and the construction will be pushed forward rapidly. The route of the new line between Acapulco and Zihuatanejo will parallel the Pacific coast the entire distance.

The Mexico Northwestern Ry. Co., a recently organized Canadian corporation, which has taken over the Chihuahua & Pacific road and the Rio Grande, has under construction 116 miles of line connecting Terragas and Madera, will start surveys at once for a line from San Antonio to Casibuiviachic, a distance of 15 miles west of San Antonio.

Alberto Legorreta is to have work started shortly on the construction of his new railroad between Queretaro at San Jose Iturbide in the State of Guanajuato. The line will be 40 kilometers long.

Bids are to be opened March 31 by W. H. Wallace, secretary of the Parkman Irrigation District, Sheridan, Wyo., for the sale of $150,000 irrigation bonds.

According to reports George E. Gunn, chief engineer for the Guggenheim interests, San Francisco, Cal., has completed plans for the construction of a railroad from Wabuska, Nev., to the new smelting plant in Mason Valley.

Articles of incorporation have been filed with the county clerk for the Athens & Tellico R. R. The company, which is subsidiary to the Louisville & Nashville, proposes the construction of a line from Athens, Tenn., to Tellico Plains, Tenn., a distance of 27 miles. The incorporators are J. B. Wright, James G. Johnson, Charles H. Seymour, J. H. Ringgold and R. C. Morrison. The company is capitalized at $25,000 and the principal offices are at Knoxville, Tenn.

Construction work is progressing rapidly on the extension of the Moshassuck Valley R. R. to tidewater. The work will include the construction of docks on the Pawtucket River near Woodlawn Station. D. C. Paton, Saylesville, R. I., is general superintendent of the railroad.

According to reports, Walter Douglas, Bisbee, Ariz., and two directors of the El Paso & Southwestern Ry. were recently in Phœnix, Ariz., making preparations for the extension of its system to that city.

It is reported that contracts have been awarded for the construction of the incline railway up Mill Mountain near Roanoke, Va.

Surveys are being made at Stanton, N. Dak., for the construction of a new depot and railroad yards.

The city council of Sheffield, Ala., has adopted an ordinance granting the Southern Ry. right of way for laying double tracks through the city. W. H. Wells, Washington, D. C., is engineer of construction of the Southern Ry.

Finances and material have been secured by the Payette Valley Railroad Co. and only the right of way must be secured between New Plymouth and Emmett before work can be started. H. E. Dunn, Payette, Idaho, is vice president and general manager of the company.

The U. S. War Department has directed Lieut. Col. G. W. Goethals, U. S. Engineer, President of the Panama R. R., Culebra, Panama, to arrange with the Panama Government for the survey of the Panama R. R. to the Costa Rican frontier. This extension has been projected for some time. Frederick Mears, Colon, Panama, is Chief Engineer, Panama R. R.

The citizens of Athens, Me., have voted to raise 5 per cent of the town's valuation to aid in constructing the electric road from Skowhegan, Me., to Athens.

The Chattanooga Southern R. R., E. C. Osborn, receiver, 111 Broadway, New York city, has been acquired by Newman Erb and associates of New York city. The road extends from Chattanooga, Tenn., to Gadsden, Ala., and has 98 miles of track.

A bill is before Congress for the incorporation of the Great Northern Alaska R. R. Co., which proposes the construction of a railroad in Northern Alaska. The company also owns a large amount of timber, copper and coal land in Alaska. Herman Barring, Wilkesbarre, Pa., is interested.

The Johnson City Traction Co., of Johnson City, Tenn., is to extend its line to the Carter Addition in that place.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

LaPorte, Ind.—Until April 4, by County Commissioners for the construction of a bridge over the Kankakee River at English Lake. C. H. Miller is Auditor of county.

Lebanon, Ind.—Until 1 p. m., April 5, by County Commissioners for the construction and repair of nine bridges. B. F. Herdrich is Auditor of Boone County.

Richmond, Ind.—Until 11 a. m., April 9, by County Commissioners for the construction of Weaver bridge, steel, Weaver concrete culvert, Middleboro concrete bridge, and for steel approach to the Murray Bridge. Demas S. Coe is Auditor of Wayne County.

Shreveport, La. — Until 5 p. m., April 12 (change of date), by C. G. Rives, Comptroller, for the construction of steel traffic bridge over Red River at Shreveport, La. The cost of the structure is estimated at $300,000. Ira G. Hedrick, Keith & Perry Bldg., Kansas City, Mo., are the Engineers.

Hingham, Mass.—Until 10 a. m., April 8, by Lieut.-Col. Edward Burr, U. S. Engineers, Boston, Mass., for altering the highway bridge and street railroad bridge over Weymouth Black River on Lincoln St., Hingham, Mass.

Maryville, Mo.—Until April 8, by George S. Miller, County Engineer, for the construction of 8 new bridges and repairing 4 old ones in Nodaway County.

Hackensack, N. J.—Until 1 p. m., April 1, by Clerk of the Board of Chosen Free Holders for the construction of a new bridge over the Erie R. R. tracks at Montross Ave., Rutherford.

Reading, Pa.—Until 10 a. m., April 15, by A. L. Rhoads, County Controller, for repairing Hartz's Mill bridge, one-half mile south of Morgantown.

Waynesburg, Pa.—Until 1 p. m., April 5, by County Commissioners, for the construction of several bridges. James MacCracken is Clerk.

Green River, Wyo.—Until April 5, by Board of County Commissioners for the construction and completion of one steel bridge over Bitter Creek, at a point north of the Union Pacific R. R. track near Thayer Junction. The structure will have one 50-ft. span and a 12 ft. roadway. Heriot Riddle is County Clerk.

Colinville, Ont.—Until noon, April 6, by T. H. Holmes, Colinville, Ont., or Neil McGugan, Wilkesport, Ont., for constructing concrete abutments and floor for a steel bridge over the Sydenham River between the townships of Moore and Sombra.

Toronto, Ont.—Until noon, April 6, by A. J. McGee, Secretary-Treasurer, Temiskaming & Northern Ontario Railway Commission, 25 Toronto St., Toronto, Ont., for the construction of abutments to bridge at M. P. 48.91 and for construction of substructure of steel trestle for Wabis River, M. P. 119.13.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Washington, D. C.—Until 11 a. m., May 7, by R. C. Hollyday, Chief Bureau of Yards and Docks, Washington, D. C., for the construction of two officers' quarters at the navy yard, Puget Sound, Wash.

Newnan, Ga.—Until 3 p. m., April 29, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, complete, including plumbing, gas piping, heating, apparatus, electric conduits and wiring of the United States Post Office at Newnan, Ga.

Shelbyville, Ind.—Until 10 a. m., April 7, by County Commissioners for the construction of a barn on the poor farm. G. G. Huntington is Auditor of Shelby County.

Boston, Mass.—Until 3 p. m., May 5, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction of the foundation, the basement and first floors of the extension, remodeling, etc., of the United States Custom House, Boston, Mass.

Boston, Mass.—Until 10 a. m., April 18, by Capt. A. W. Miller, Constructing Quartermaster, Boston, Mass., for the construction, plumbing, heating, electric wiring and fixtures of one double set of officers' quarters, one double set of non-commissioned officers' quarters, and one quartermasters' storehouse, at Fort Strong, Boston Harbor, Mass.

Jefferson Barracks, Mo.—Until 11 a. m., April 9, by Capt. Stanley H. Ford, Quartermaster, for remodeling 4 stable guard houses for enlisted men.

Rochester, Minn.—Until 3 p. m., April 26, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office at Rochester, Minn.

Waseca, Minn.—Until 2 p. m., April 16, by Waseca County Farmers' Elevator & Mercantile Association of Waseca, Minn., for the removal of the elevator, flour house and coal sheds owned by said association from its present lo-

cation to a new site and also for building foundation therefor on new site. James Byron is President.

Bayonne, N. J.—Until 10:30 p. m., April 14, by Board of Education of the city, Avenue C and 26th St., for necessary labor and material for the construction of public school building No. 11, between West 23d and West 24th Sts. W. J. Tomlin is Secretary of the Board.

Tacoma, Wash.—Until 3 p. m., May 11, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the metal vault shelving for the U. S. post office and court house and custom house at Tacoma, Wash.

Milwaukee, Wis.—Until noon, April 17, by Board of Park Commissioners, for the construction of a children's shelter in Mitchell Park.

Fort D. A. Russell, Wyo.—Until 9:30 a. m., April 13, by Capt. V. K. Hart, Constructing Quartermaster, Room 3, Keefe Hall, Cheyenne, Wyo., for the construction, plumbing, wiring, for electric motors and lights, electric fixtures, furnishing and installing laundry machinery and equipment, boiler, feed, pump, etc.

Charleston, W. Va.—Until 3 p. m., May 4, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system of an extension, remodeling, etc., to the United States post office and court house at Charleston, W. Va.

Fort Mackenzie, Wyo.—Until 2 p. m., April 18, by Constructing Quartermaster, for the construction and electric wiring of a reinforced concrete root house, Plan 195.

Lander, Wyo.—Until 3 p. m., May 2, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction including plumbing, gas piping, heating and ventilating apparatus, electric conduits and wiring and standard clock system, of the United States Post Office at Lander, Wyo.

Kipling, Sask.—Until noon, April 15, by John Sproat, Secretary-Treasurer, for the erection and construction of a 4-round brick veneer school building with stone basement.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

New London, Conn.—Until 11 a. m., April 13, by Capt. F. T. Arnold, Constructing Quartermaster, New London, Conn., for the construction of approximately 1,700 lin. ft. of macadam road and 1,100 sq. yds. of concrete sidewalks at Fort. H. G. Wright, N. Y. Official advertisement of this work will be found elsewhere in this issue.

Atlanta, Ga.—Until 3 p. m., April 4, by Mayor and General Council, for the construction of creosoted wooden blocks on North Boulevard from Ponce de Leon Ave. to North Ave. The work includes approximately 3,500 sq. yds. R. M. Clayton is City Engineer.

Iowa City, Ia.—Until 2 p. m., April 1, by O. J. Slater, City Clerk, for the improvement of Washington St., between Linn St. and the B. C. R. & N. Ry. tracks, including 2,000 cu. yds. of grading, 1,200 lin. ft. of curbing, 4,450 sq. yds. of paving and for the improvement of Summit St., from the C. R. I. & P. Ry. to Kirkwood Ave., including 1,600 cu. yds. of grading, 2,700 lin. ft. of curbing, 4,550 sq. yds. of paving.

Belleville, Ill.—Until 3 p. m., April 4, by Board of Local Improvements, for the construction of 35,000 sq. yds. of street paving with vitrified brick, including excavating and curbing and a small amount of sewering. Fred J. Kern is Mayor. Official advertisement will be found elsewhere in this issue.

Frankfort, Ind.—Until 2 p. m., April 9, by County Commissioners for the construction of five gravel roads. Charles F. Cromwell is Auditor of Clinton County.

Fowler, Ind.—Until 1 p. m., April 9, by County Commissioners, for the construction of four gravel roads. Lemuel Shipman is Auditor of Benton County.

Madison, Ind.—Until 1 p. m., April 7, by County Commissioners for the construction of road in Monroe township. Gaylord F. Crozier is Auditor of Jefferson Township.

Wabash, Ind.—Until 1 p. m., April 23, by County Commissioners of Wabash and Grant Counties for the construction of a gravel road on the line between the counties. J. P. Noftzger is Auditor of Wabash County.

Noblesville, Ind.—Until 1 p. m., April 12, by County Commissioners, for the construction of seven gravel roads. George Griffin is Auditor of Hamilton County.

Baltimore, Md.—Until noon, April 7, by State Roads Commission, Union Trust Bldg., Baltimore, Md., for the construction of 52 miles of state road in counties as follows: Allegany—On the National Pike between Standard Oil warehouse and Pennsylvania Railroad crossing, a distance of about .53 miles, in one section. Macadam. On the National Pike between Six-Mile House and Allegany Grove, a distance of about 1.02 miles, in one section. Macadam. On the National Pike in Garrett County from the Garrett County line towards Piney Grove, a distance of about 2.38 miles, in one section. Macadam. On the National Pike between Six-Mile House and Flintstone, a distance of about 6.95 miles, in one section. Macadam. Anne Arundel—On the road between Owings and Mount Zion, from the end of the 1909 work to Mount Zion, a distance of about 5.19 miles, in one section. Grading, bridging and draining only. Mergens, Excelsior, Minn., at $9,760, for grading Centerville Road from Manomin Road to Anoka county line; J. J. Mergens, at $14,680, for grading and macadamizing Lexington Ave., from Manomin Road to Turtle Lake Road; P. J. Ryan, St. Paul, Minn., at $12,800, for macadamizing Bald Eagle Lake Ave., from Smith's Hotel east to Bald Eagle Lake Ave.

Kansas City, Mo.—Roads.—Doboins & Wilson, at $13,750, for grading the Duck road, and at $6,772, for grading the Red Ridge road. The Duck road will be three miles in length and the Red Ridge road a little over two miles.

Kansas City, Mo.—Road.—Davidson Bros., at $1.65¾ per cu. yd., for resurfacing a portion of the road running from Dallas east to an intersection with the Holmes St. road, about two miles. The cost will approximately be $6,000.

Kansas City, Mo.—Grade and Drain.—Fern Bros., at $12,290, for grading and draining Holmes St., from 85th St. south to its intersection with the Kansas City and Martin City road, the distance being three and a fourth miles. Hood & Randall, at $5,471, to grade and drain Murphy road from the southwest corner of the city farm to Swope parkway and Raytown Blvd., the distance being two miles.

St. Joseph, Mo.—Grading.—Kelley & Buis, for grading Main St., from Poulin to Isabelle.

Corning, N. Y.—Paving.—J. R. Bradley, Corning, for the construction of about one and one-half miles of macadam pavement; J. R. Steele, Owego, N. Y., for the construction of about one and one-half miles of brick pavement.

Jamestown, N. Y.—Paving.—Warren Bros. Co., for the construction of 1,810 sq. yds. of bitulithic pavement in this city.

Oxford, N. C.—Road.—Emporia Concrete & Construction Co., Emporia, Va., for the construction of 20 miles of soil road. About 3,000 cu. yds. of excavation is required.

Cincinnati, O.—Road.—John Snyder, Norwood, O., at $10,463, for the improvement of Madison road from Cooper Ave., to Cornell Ave., in Sycamore Twp. Bids were opened Mar. 18.

Miami, Okla.—Paving.—Pardon S. Kaull, for the construction of 27,370 sq. yds. of bitulithic pavement in this city.

Portland, Ore.—Paving.—Warren Construction Co., for the construction of 20,306 sq. yds. of bitulithic pavement in this city.

Portland, Ore.—Paving.—Pacific Bridge Co., for the construction of 1,807 sq. yds. of bitulithic pavement in this city.

Fort Worth, Tex.—Paving.—Texas Bitulithic Co., for the construction of 17,500 sq. yds. of bitulithic pavement in this city.

Dallas, Tex.—Paving.—Texas Bitulithic Co., for paving May St., from Laurel to Terrell Ave., and Magnolia Ave., from South Main to Jennings Ave.

SEWERS AND WATER SUPPLY.

Tuscaloosa, Ala.—Sewer.—J. Whit Gurley & Co., Mobile, at $18,000, for the construction of a new sewer in this city.

Lodi, Cal.—Sewer System.—J. M. Appleton & Frederickson Bros., at $51,226, for the construction of the city sewer system. Gladding, McBean & Co., Lincoln, Cal., at $17,401, for furnishing all of the pipe. The contract is to be completed within 100 days.

Greeley, Colo.—Sewer.—Spicer & Wattson, Colorado Springs, Colo., at $18,659, for the construction of sewers in the city. Bids were opened Mar. 1.

Joliet, Ill.—Water Main & Sewer.—William Moran & Co., Joliet, Ill., for the construction of a water main on Meda Ave.; S. R. Spears, Joliet, for the construction of the Broadway St. sewer.

Burlington, Ia.—Sewer.—Bernard Bros. & Mercer, for repairing the Hawkeye sewer.

Davenport, Ia.—Sewers.—P. Connelly, at $.69, for the construction of a sewer in South St., between Davie and Division Sts. Hydraulic Concrete Construction Co., at $.93, for the construction of a sewer in Christie St., from Eddy to Fulton Ave., and Fulton Ave., from Christie to Jersey Ridge road.

George, Ia.—Waterworks System—Des Moines Bridge & Iron Co., at $10,400, for the construction of a waterworks system in this city, including 500 ft. of hose and a hose cart.

Sabetha, Kan.—Water Mains.—T. C. Brooks & Sons Co., Jackson, Mich., for the construction of 10 miles of water mains; The Western Valve Co., Kansas City, Mo., for hydrants and valves; Des Moines Bridge & Iron Co., Des Moines, Ia., for steel tower and tank; Mr. Stimpson, Sabetha, Kan., for the reinforced concrete reservoir.

Wakefield, Kan.—Waterworks.—Fred M. Clark, Savannah, Mo., at $15,000, for the construction of a water works in this city.

Mt. Sterling, Ky.—Sewer.—Paul & Kershner, Dayton, O., at about $50,000, for the construction of a sewer system in this city. The sewer will be 10 miles in length. The work is to be commenced by April.

Centralia, Mo.—Water & Sewer Systems.—Following contracts in connection with the water and sewer systems for this city were awarded: American Pipe Co., St. Louis, Mo., at $11,819, for furnishing the cast iron pipe necessary; Eureka Fire Hose Co., New York, N. Y., at $0.90 per ft. for furnishing 1,500 ft. of hose, including three 10 ft. fire nozzles and three reels; Des Moines, Ia., Iron & Bridge Co., at $4,500, for the 70,000 gal. water tank and the 125 ft. steel tower; Renswalter Co., Troy, N. Y., for furnishing hydrants of the Corey patent.

St. Joseph, Mo.—Sewers.—Board of public works awarded the following sewer contracts: Oscar Schmidt, for the construction of three sewers in districts 109, 94 and 112; E. F. Mignery, for a sewer in district 109; D. B. Kelley, in district 94.

Sedalia, Mo.—Sewers and Sewage Disposal Works.—William F. Hall, Clinton, Mo., at $38,624, for the installation of a complete sewage disposal works and sanitary sewers.

Albany, N. Y.—Sewers.—Following contracts have been awarded to John Doyle by the board of contract and supply: Sewer through the proposed sunken garden, $15,418; sewer in Manning Blvd., from Washington Ave. to Lancaster St. $971; sewer in Myrtle Ave., from Quail St. to Ontario St., $578; sewer in Putnam St., from Second Ave. to a point 500 ft. south, $496.

Monticello, N. Y.—Sewer System and Disposal Plant.—C. S. Lambie Co., Pittsburg, Pa., at $66,300 for the construction of the sewer system and $26,600 for the construction of the sewage disposal plant. Work will be commenced by April 1.

Dayton, O.—Sewer.—Hecker & Kerschner, at $6,801, for the construction of the Haynes St. storm sewer. The contract calls for a 36-in. concrete sewer with brick invert.

Clinton, Okla.—Sewer.—Heman Construction Co., St. Louis, Mo., at $17,838, for the construction of sewers in this city. Bids were opened Mar. 15.

Franklin, Tenn.—Extensions—Water & Sewer Systems—J. W. Worthington, of the Sheffield Cast Iron Pine & Foundry Co., at $35,000, for building the extension to the waterworks and sewerage systems. The work will be under the direction of Granberry Jackson, Mt. Pleasant.

Seattle, Wash.—Pipe Line.—Hans Pederson, for the pipe line extension between Harvard Ave., north and Lake Union and the new twin reservoirs at Green Lake. Steel pipe will be used and the line will be permanent, except across the lake, where it will rest temporarily on piles. Each reservoir will hold 50,000,000 gals.

EXCAVATION, MISCELLANEOUS, MATERIALS.

Phoenix, Ariz.—Pumping Engine.—Nordberg Mfg. Co., at $14,000, for furnishing the city with a 5,000,000 gallon capacity cross compound Corliss pumping engine. Bids were opened Mar. 14.

Laporte, Ind.—Building.—S. A. Lambert, for the construction of a new store building, corner of Main and Clay Sts., for F. H. Morrison. The structure will be of steel, brick and concrete construction throughout, and cost between $10,000 and $12,000. The building is to be completed before June 1.

Laporte, Ind. — Buildings. — Central States Bridge Co., Indianapolis, Ind., for the construction of two manufacturing buildings for the M. Rumely Co. The cost of the two buildings will be about $100,000. Both will be steel construction, with reinforced concrete.

Moscow, Ind.—Church.—Joe Bennett, at $3,182, for the erection of the new Christian church in this city.

Cherokee, Kan.—Boiler.—Pittsburg Boiler Works, for furnishing a boiler for the waterworks pumping plant.

Portland, Me.—Mooring Stones.—William S. White, Rockland, Me., at $756, is reported to have received the contract for furnishing mooring stones for use in the first lighthouse district for the fiscal year. Bids were opened Mar. 16.

Boston, Mass.—Oiling & Cleaning.—Following contracts were awarded by Supt. Emerson of the Street Department for street cleaning oiling and watering: John H. Winsloe, at $10,979, for street cleaning in Dorchester and Ashmont; F. B. McKinney, at $5,990, for street cleaning in Brighton; Joseph McGreevey, at $8,490, in West Roxbury; For oiling and watering, Thomas F. Lynch, at $5.18 per day for each double team, in South Boston and Dorchester north; J. P. O'Rioden, at $5.40, in East Boston and Charleston; J. H. McCarthy, at $5.25, in Brighton; M. McGinniss & Co., at $5, West Roxbury; John H. Winsloe, $4.94. Dorchester and Ashmont; James E. Noble, at $5.15, Roxbury south and Jamaica Plain; Joseph McGreevey, at $5, South End and Roxbury north; W. Gilligan Co., at $5.25, North End, West End and Back Bay.

Lowell, Mass.—Warehouse.—Albethaw Construction Co., Boston, Mass., for the construction of the new reinforced concrete warehouse of the Massachusetts Cotton Mills Co., this city. The dimensions are 100 ft. x 256 ft., 12 stories. Work is to begin at once. Architects, Lockwood, Greene & Co., Boston, Mass.

Kansas City, Mo.—Powder, Tools, Etc.—Mize Hardware Co., Independence, by the county court, for supplying powder and tools; Smith Mercantile Co., of this city, for supplying the graders and scrapers.

Addison, N. Y.—Lights.—Electric Light, Co., at $75 an arc light a year, for lighting the streets of the city with electricity.

New York City, N. Y.—Gate Valves.—Coffin Valve Co., Boston, Mass., for board of water supply, contract No. 42, for furnishing and delivering eight 3-ft. by 8-ft. two-sluice gates, eight 20-in. hand operated gate valves, ten 60-in. gate valves, with operating mechanisms, four 60-in. gate valves with individual electric drive, four 60-in. gate valves with gang drive, two 60-in. hydraulic lines of floor drive shafting, for structures at Ashokan reservoir, near Brown's Station, Ulster County, and at Croton Lake siphon, Westchester County, New York. Bids were opened March 8.

Fort Reno, Okla.—Tank, Tower—Des Moines Bridge Co., Des Moines, Ia., at $6,500, for the construction of the tank and tower. Bids were opened Mar. 14.

Cleveland, O.—Refrigerating Machinery.—Following bids were received for the installation of complete refrigerating machinery for drinking water system: Brunswick Machinery Co., $5,485; The Phoenix Ice Machine Co., Cleveland, 7,500; The Peerless Ice Machine Co., Cleveland, $8,413. Bids were opened March 23.

Cleveland, O.—Vacuum Cleaning System.—Following bids were received for the installation of a complete vacuum cleaning system for the Cuyahoga Court House: Connersville Blower Co., Connersville, Ind., $3,160; The Blaisdell Machinery Co., $3,350; Vacuum Engineering Co., $3,810; S. K. Elliott Electric Co., Cleveland, $3,900; The Vacuum Cleaner Co., $4,500. Bids were opened March 23.

Forest Grove, Ore.—Supplies.—Portland Wood Pipe Co., Portland, Ore., for furnishing 27,000 ft. of distributing mains, 40 Corey hydrants, cast iron fittings, etc., for this city.

Knoxville, Tenn.—Building.—Claiborne & Brooks, for the erection of the "Cherokee" building, a three-story and basement office building to be constructed at the corner of Church Ave., and Prince St., for Drs. S. R. Miller and G. O. Bicknell, from plans drawn by Gredig & Lynn, architects. The building will cost about $12,000.

Mexia, Tex.—School House.—Charlev Fuqua, for the construction of a new brick school house at this place.

Lemay, Utah.—Pipe.—Portland Wood Pipe Co., Portland, Ore., by the Southern Pacific Railway Co., for furnishing 29 miles of 8 and 6-in. pipe for head pressure varying from 150 ft. to 300 ft. head. This pipe is to be used in one line near this city, on the west side of Salt Lake,

and is to furnish water for tank and domestic service.

Salt Lake City, Utah.—Heating and Electric Plant.—Trent Engineering and Manufacturing Co., for the erection of the heating and electric plant for the Mormon church in the center of the block west of Temple square. The plant will cost between $150,000 and $200,000. Heat and electric power will be furnished by this plant for the Tabernacle, the Temple, the Assembly Hall, the new Utah Hotel, the Deseret News Building L. S. University, the new Vermont Building and the Sharon Building.

Milwaukee, Wis. — Water Pipe. — Michael O'Donnell, for furnishing the city for the use of the water department 500 tons of 20-in., 360 tons of 30-in. and 2,000 tons of 36-in. class "C" cast iron pipe, and 50 tons of class "C" special castings, at the following prices for laying: 4-in., $0.34 per lin. ft.; 6-in., $0.32 per lin. ft.; 8-in., $0.37 per lin. ft.; 12-in., $0.53 per lin. ft., and 16-in., $0.68 per lin. ft.

Milwaukee, Wis.—Water Gate Valves.—B. Hoffman Manufacturing Co., of this city, for furnishing and delivering to the city 300 6-in. gates, 50 8-in. gates, 30 12-in. gates, 15 16-in. gates at $15.50, $25, $40.95 and $73.75, respectively.

Calgary, Alta.—Building.—Carter, Halls Aldinger Co., at $125,000, for the construction of a 6-story business block in this city for Leeson & Lineham. It will be of cement and concrete construction.

PROJECTED WORK.

Bridges.

Items Arranged Alphabetically by States.

Van Buren, Ark.—A corps of Kansas City, Mo., engineers are sounding the river at this city preparatory to selecting a site for the proposed free bridge.

San Diego, Cal.—Engineers are preparing plans for the construction of an artistic trestle across the canyon at the entrance of Kensington Park, a new residence subdivision of San Diego.

San Rafael, Cal.—County Commissioners have rejected all bids for the construction of the Belvedere-Tiburon Bridge on account of their being too high. County Surveyor is to prepare new plans and specifications.

Hartford, Conn.—Board of Finance recommended that the City Council pass a resolution authorizing the Board of Street Commissioners to reconstruct the Farmington Ave. bridge and that an appropriation of $18,000 be made for the purpose.

Des Moines, Ia.—Engineering preparations for the West Seventh St. viaduct are progressing rapidly and it is expected by C. H. Cartlidge, Bridge Engineer, Chicago, Burlington & Quincy R. R., Chicago, Ill., that bids for a portion of the work will be advertised within 30 days.

Sioux City, Ia.—Street Committee is to take up the matter of constructing a bridge over Bacon Creek in the vicinity of Glass Ave., in accordance with the petition which was recently filed by the property owners.

Lewiston, Ill.—The Bridge Committee appointed by the County Board has decided upon the construction of a bridge in Bernadotte township.

Lincoln, Ill.—Arrangements are being made for the construction of a $7,000 bridge across Salt Creek on the new road going through Corwin township. Gus Knecht, Beason, Ill., and Adrew Eisiminger, Latham, Ill., are members of the supervisors' committee.

Rock Island, Ill.—Representatives of Henry and Rock Island Counties have decided to construct a bridge over the Rock River at Coloma, Ill. The structure as proposed is estimated to cost $50,000.

Fort Wayne, Ind.—County Commissioners have voted to build a new bridge across the St. Joe river connecting Lakeside and Sy Run Ave. district at the east end of Wagner St.

Richmond, Ind.—A petition has been circulated through Milton Township asking the County Commissioners to construct a bridge across Noland's Fork in the eastern section of this township.

Hiawatha, Kan.—County Commissioners have taken up the matter of constructing a new 110-ft. bridge across the Wolf River east of town to replace the present 60-ft. Dickinson bridge.

Louisville, Ky.—Hearing is to be held April 6, by United States War Department at Cincinnati, O., on the application of the Kentucky & Indiana Bridge and Railroad Co. to construct a bridge across the Ohio River between Louisville and New Albany, Ind. Plans for the structure have already been prepared by J. M. Johnson, President of the Louisville Bridge and Iron Co.

Worcester, Mass.—Directors of the Worcester & Providence R. R. have filed a petition with W. H. Towne, City Clerk, for permission to enlarge the bridge over South Bridge St.

Greenville, Mich.—The Pere Marquette R. R. Co., it is said, is planning the construction of a new bridge over the Flat river at this place. The structure will consist of two 50-ft. spans on concrete abutments.

Anthony, Minn.—Town Board has decided to construct a bridge across the Marsh River between Mrs. E. T. Saen's and Bjerland places.

Philipsburg, Mont.—Arrangements have been completed for the rebuilding of the county bridge across the Deer Lodge River at Drummond.

Polson, Mont.—Citizens have raised $3,000 toward the construction of the bridge across Pend'Oreille River opposite this place. The proposed structure will be 1,744 ft. in length.

Columbus, Neb.—The new bridge at Duncan was partly destroyed by an ice gorge recently and will be repaired at an estimated cost of $2,000.

Winnemucca, Nev.—Plans and specifications for the construction of the new county bridge over the Humboldt River at this place have been accepted by the County Commissioners and bids for the work will be advertised soon.

Fenton, N. Y.—Special elections will be held in this town and Chenango April 12, for the purpose of deciding whether the towns shall bond for the construction of a new highway bridge at Chenango Bridge.

Vernon, N. Y.—Council voted to expend $1,000 for the construction of foot bridges over Sconondoa Creek and Bartholomew's dike.

Fremont, Neb.—Commissioners of Dodge and Saunders Counties have decided to construct a new steel bridge over the Platte River south of this city. The steel structure will be 650 ft. in length.

Cincinnati, O.—F. E. Morris, Bridge Engineer, submitted plans and specifications to Director Sundmaker for the approval of the council. The plans call for the construction of three bridges. One to cross Burbank St. and the Cincinnati, Lebanon & Northern R. R. tracks, estimated to cost $14,850; another over the West fork of Mill creek, to cost $6,177, and the third over the Cincinnati, Lebanon & Northern tracks at Whittier St. to cost $7,075.

Cleveland, O.—City Council has referred a resolution authorizing a special election on the question of issuing $1,000,000 of bonds for the construction of a high level bridge connecting Clark Ave., S. E., and Clark Ave., S. W., to committee.

Cleveland, O.—According to reports the Erie R. R. is planning the construction of a double track lift bridge at this place.

Covington, O.—County and City are to take up the matter of repairing the bridge over the Banklick Creek.

Lisbon, O.—County Engineer French and J. Q. Rothany, Engineer, East Liverpool Traction & Light Co., have taken up the matter of repairing the bridge recently washed out.

Niles, O.—County Commissioners and Engineer Watson, Cleveland, O., have viewed the proposed site for the viaduct connecting Park Ave. extension with the city.

Portsmouth, O.—Citizens of Arion, O., have presented a resolution to the County Commissioners asking for the construction of a bridge at Arion, O.

Springfield, O.—As soon as plans are completed for the construction of the High St. bridge, the officials of the Cleveland, Cincinnati, Chicago & St. Louis R. R. will take up the matter with the City Council.

Basin, Wyo.—County Commissioners have ordered the construction of two new bridges, one over the mouth of the Pat O'Hara creek and the other at Meeteetse over the Greybull.

Brockville, Que.—City has voted to issue bonds amounting to $16,000 for the construction of six bridges throughout the town.

Roads and Streets.

Items Arranged Alphabetically by States.

Gadsden, Ala.—Property owners on Third St., have asked that that thoroughfare be paved with brick from Chestnut to Locust.

Gadsden, Ala.—Petition is being circulated among the property owners of South Fifth St., for the paving of that thoroughfare from Chestnut to Cherry.

Little Rock, Ark.—Superintendent of Public Works, E. A. Kingsley, has recommended the following improvements: That Scott St., from Third to 15th, be covered with asphalt at an estimated cost of $20,962; that Rock St., from the Iron Mountain railroad to Third St., be paved with brick at an estimated cost of $7,700, and Rock St., from Fifth to 15th Sts., be covered with asphalt at an estimated cost of $25,000.

Auburn, Cal.—Petition has been granted for the construction of a new road running from the Carl place on the Lincoln and Penryn road up Dutch Ravine to Newcastle.

Bakersfield, Cal.—Property owners on F St., between 19th St., and the Santa Fe depot are contemplating the paving of that portion of the thoroughfare.

Benica, Cal.—City has voted the issuance of $100,000 worth of street improvement bonds.

Sacramento, Cal.—Riverside road, from Sutterville to the brick yards is to be macadamized. Residents of the Upper Stockton road have asked the Board of Supervisors to asphalt 24 ft. of the road from 31st and P Sts., to the State Fair grounds at an estimated cost of $21,000.

San Rafael, Cal.—Supervisor Michael F. Burke will spend $120,000 for the improvement of highways in Marin county

Los Angeles, Cal.—Board of Supervisors have adopted specifications for the construction of the Whittier road from the city limits of this city to East Whittier, a distance of 10¾ miles. Bids are to be asked for at once.

Boulder, Colo.—Boulder Boosters' Club is back of a movement to build a scenic auto road from this city to Estes park.

Belleville, Ill.—Survey and the estimated cost of building the Belleville and Mascoutah road through Silver Creek bottom is being made by Asst. State Engineer T. R. Agg, of Springfield.

Benton, Ill.—Plans have been made for the construction of 36,200 sq. yds. of vitrified brick pavement on a Portland cement foundation. The work will include 21,650 lin. ft. of sandstone curb, concrete filler and 16,200 cu. yds. of excavation. The estimated cost of the work is $82,287. L. L. Harper, Belleville, Ill., is the engineer. A. S. Cleveland, Chairman Improvement Committee, has charge of the work.

Silvis, Ill.—This village is contemplating extensive paving improvements this coming summer.

Waukegan, Ill.—Improvement Board has passed a resolution for the paving of McAlister Ave. The improvement is estimated to cost $40,000.

Fairmount, Ind.—County Commissioners have been petitioned for the improvement of a highway in Fairmount township, Grant County, by grading, draining and paving with gravel or macadam.

Franklin, Ind.—County Commissioners have been petitioned for the improvement of the Murphy gravel road, in Hensley township, Johnson County, by grading, draining and paving with gravel.

Lafayette, Ind.—Plans are being formulated for an improvement of the riverside drive from this city to the State Soldiers' Home and the Tippecanoe battlefield. The plans contemplate a widening and macadamizing of the roadway for a distance of eight miles. The estimated cost is $50,000.

Logansport, Ind.—Plans and specifications are being prepared by City Engineer Harry Thompson for the construction of brick pavement on Sycamore St., from the north line of the Vandalia railroad right-of-way to the south line of Center St. Petition will probably be filed soon for the paving of the street north of Center St.

Muncie, Ind.—Board of works has granted permission to the county commissioners to pave with brick East Wysor and Broadway Sts.

Peru, Ind.—Petition will be presented to the Board of Commissioners of Miami County by residents of Washington township on April 5 for the construction of a three-mile gravel, macadam or other material road in that township.

Corydon, Ia.—A rock road will probably be built between Corydon and Bridgeport. Farmers are securing the necessary amount for the work.

Fort Dodge, Ia.—City Council has declared it necessary to pave the following streets with asphalt: Second Ave., south from 15th St. to west line of 17th St.; Third Ave., south from 15th St. to west line of 17th St.; Fourth Ave., south from 15th St. to west line of 17th St.

Oskaloosa, Ia.—A movement is on foot for the construction of a dragged road from Burlington through Fairfield, Ottumwa, Oskaloosa and Pella to Des Moines. The auto club of this city, Otis Nugent, President, is interested.

Manhattan, Kan.—Highway Engineer Gearhart has submitted plans for grading and dragging the Central Kansas-Colorado Blvd. This boulevard will parallel the new Santa Fe trail.

Colfax, La.—Petitions are being circulated throughout Grant Parish asking the Police Jury to grant an election for the purpose of voting on a 5-mill road tax for five years for the good road building in Grant.

Annapolis, Md.—A bill has been introduced in the House authorizing the county commissioners of Queen Anne's to issue $15,000 of bonds for the purchase of teams, carts, wagons and necessary machinery and implements for the construction of roads.

Kansas City, Mo.—Following resolutions for public work were sent to the Board of Public Works for adoption: Grading—Hardesty, from Fifteenth to Twenty-third; Walnut, from Fifty-ninth to Fifty-first; Denver, from Hughes to Seventeenth. Asphalt pavement — Fifty-fifth from Harrison to Troost. Brick block pavement —Twelfth, from Cleveland to Jackson; Twelfth, from Elmwood to Manchester. Artificial stone curbing—Twelfth, from Cleveland to Jackson; Twelfth, from Elmwood to Manchester. Artificial stone sidewalk—Prospect Avenue, from Thirty-ninth to Swope Parkway; Topping, from Twelfth to Fifteenth; Charlotte, from Twenty-fifth to Twenty-sixth; West Prospect Place, from Forty-fourth to Forty-fifth; Forty-fifth, from W. Prospect Place to Madison Avenue; Twenty-fifth, from Woodland to Michigan Avenue.

Kalispell, Mont.—County Surveyor has been instructed to survey and establish a wagon road from Bigfork to the reservation line on the east side of Flathead lake to connect with the road as surveyed from the town of Polson north to said reservation line.

Hastings, Neb.—Petitions have been circulated for the paving of Hastings and St. Joe Aves.

Hastings, Neb.—Petition has been submitted to the city council for the extension of Second St. pavement from Burlington Ave., to the west side of Briggs Ave.

London, O.—J. J. Shafer, auditor of Madison County, will sell bonds April 4, in the sum of $42,800 for ditch and road improvement.

A Price Reference Number of Engineering-Contracting.

We have collected for this issue of ENGINEERING-CONTRACTING a large number of data on prices of materials, small tools and supplies used in construction work and many additional data on wages and prices of pavement and street work. Prices are variable things and in many cases the figures that we give will have changed in a few days or weeks, but for the most part they will not vary so much as to cease to be useful for rough estimating for some time. No contractor will make close estimates without actual quotations. The prices that we publish are not intended to or expected to nor should they be used to replace such quotations in making bids, but they are useful for general estimating purposes. They have been compiled with care and we trust that trial will prove their usefulness to our readers.

A Noteworthy Article.

A good many articles have been printed on the cost of producing electricity, although many of these have been estimated costs rather than records of actual performance. No article, so far as we know, has ever given the unit cost of producing and distributing electricity for lighting with any such completeness and detail as will be found elsewhere in this issue. We refer to our analysis of the first cost of the plant of the Edison Electric Illuminating Co., of Brooklyn, and of its operating expenses.

Of course most of the items of expense there given are higher in Brooklyn than they would be in cities of less size, for it is a curious anamoly that the larger the city the greater the unit costs of electric lighting are apt to be, excepting the items of fuel and general supervision. Even the use of mechanical stokers and other labor saving devices do not offset the higher wages paid to employees in large cities. But, more important than wages are the items of plant charges—interest, repairs and depreciation. High costs of real estate and buildings in a large city are to be expected, but one is apt to overlook the fact that the cost of pole lines and conduits is also sure to be much greater than in small cities. The transmission lines of this Brooklyn Edison Co. alone cost $175 per K. W.; yet the company rents a large amount of duct miles (at least 117 miles).

The interesting fact is brought out that 32½ per cent of the electricity produced is lost in transmission. This is slightly in excess of similar losses on Manhattan, which average 30 per cent. Here, again, is an item that has seldom been mentioned in any article on the subject of electric lighting.

The exceedingly low cost of repairs of electric generators is worthy of special attention. The first cost of the steam plant (boilers and engines) was very slightly more than the first cost of the electric generating plant, yet the cost of repairs of the steam plant was 17 times the cost of repairs of the electric generating plant. This ratio of 17 to 1 is, of course, unusual; still, as we shall show in a subsequent issue, a ratio of 4 to 1 existed in the power plant of the Interborough Rapid Transit Co. during the same year. Engineers have unquestionably overestimated the annual cost of repairs of electric generators, just as, in most instances, they have underestimated the repair costs of steam plants. We may add, however, that the whole subject of the cost of repairs to machinery is one that has never received in the technical press even a modicum of the consideration it deserves.

Henceforth it will be our object to secure and publish data on operation and maintenance of machines of all kinds, so that, in the course of time, we may parallel what we have already accomplished in publishing construction cost data. With this end in view, we urge our readers to contribute facts relating to the cost of repairs of machines and plants.

The Growing of Confidence in Wate Sterilization.

In discussing the filtration of water supplies the *Surveyor* (London) says:

It is obvious that well waters free from suspended matter and other waters of similar quality are often bacterially impure, and therefore require sterilization without filtration, the filtration in such cases being practically useless. We have often urged in these pages the importance of removing the matters in suspension from waters, and even from sewage effluents, before applying the sterilizing agent which otherwise is wasted in dealing with the organic matter. There can be no question as to the relative values of filtration and sterilization. There is no comparison. One might as well compare the relative values of pumping and filtration. Matters in suspension must be removed by sedimentation or filtration and cannot be removed by sterilization; to suggest such a process is absurd, but, on the other hand, if the filters are used for their legitimate purpose, viz., for the removal of suspended matters and not for the removal of bacteria—their rate of working may be greatly increased and the bacterial purification can then be best effected by sterilization.

The above shows the extent to which the idea of water sterilization has grown. Two years ago considerable opposition was met with when proposals were seriously made to sterilize water used for drinking and domestic purposes generally.

Professor W. P. Mason at the Milwaukee meeting in 1909 of the American Water Works Association stated that at first he was opposed to the use of bleaching powder as a disinfectant and had gone on record as not approving of the process. Now, however, he is a convert and was converted because of the results of many experiments. He found that the dose was exceedingly small that was required to produce satisfactory treatment. He believes that the consumers do not get any liberated chlorine, but that if they do the amount would be so small that it would not make much difference. He found that three-one hundredths of a grain of bleaching powder per U. S. gallon, measured as available chlorine, was sufficient to do good work and reduce the number of bacteria from a high figure to nearly zero. Water containing about 100,000 per c. c. was used and after the treatment the count was reduced to four, five, six and ten. Intestinal organisms were simply wiped out. The increasing popularity of disinfection will result in an increased use of filters. The many claims for bacteriological efficiency of filters and frequent failures to meet requirements deter many cities from attempting to improve water supplies. The use of filters, however, to reduce turbidity, hardness and alkalinity with disinfection for bacteriological effect in time of epidemic seems logical to even the most dull witted official.

The rate of flow may be considerably increased through filter beds under such arrangement, present rates being influenced largely by bacterial conditions. Cases have been reported, however, in which sterilized water has been badly affected by algae. Copper sulphate is a good algicide, but has not been proven an efficient or safe germicide. It may be necessary to use bleaching powder in combination with copper sulphate and chemists have a pleasant prospect in the water question. Something new is being learned each day and one difficulty is overcome as another is manifested.

Some Records and Costs of Operation of the Cincinnati Filtration Plant for Six Months of 1909.

The following operating data cover six months, Jan. 1 to June 30, 1909, of operation of the new filtration plant at Cincinnati, O., the costs of construction of which were summarized in our issue of March 30, 1909. During this six months' period the average amount of water filtered daily was 41,258,440 gals., using an average of 0.9 gr. of lime and 1.95 grs. sulphate of iron per gallon, or, stated in other terms, 2.06 ozs. lime and 4.46 ozs. sulphate of iron per 1,000 gals. The average cost of chemicals used was $1.99 per million gallons of filtered water. The total cost of coagulating and filtering the water was $4.62 per million gallons delivered to consumers, which includes the cost of operation, light, power, chemicals, fuel, maintenance, repairs, wash water and all supplies. The items of cost are as follows:

Item.	Total.
Labor	$11,959
714.9 tons coal	1,701
484.9 tons lime	3,181
1,047.8 tons sulphate of iron	11,190
Supplies	1,472
Electric power and light	2,442
Repairs	695
Express and freight	124
Insurance, tel. and transp.	65
188,967,348 gals. wash water	620
52,103,360 gals. water used and lost	171
Total	$33,620

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Concrete Building Construction of Separately Molded Members and Its Cost.*

The more prominent examples of buildings constructed entirely of unit concrete members are the Textile Machine Works, at Reading, Pa.; the new building of the Edison Portland Cement Co., at New Village, and the car barns of the Central Pennsylvania Traction Co. In addition to these the author has designed and supervised the erection of several such buildings during the past summer, one of which is particularly interesting as regards comparative cost, since it illustrates the possibility of the system applied to the higher type of buildings, using the reinforced steel design with unit factory made floor members.

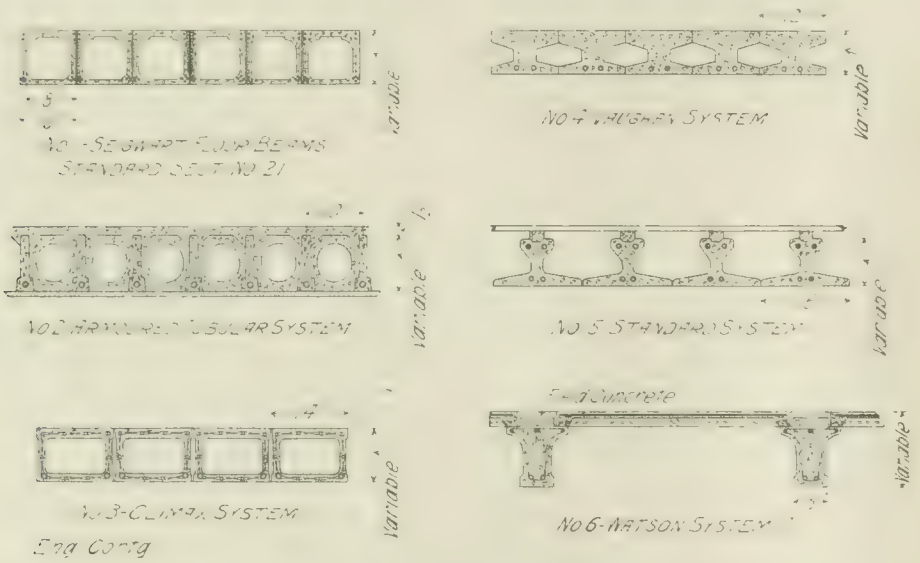

Fig. 1.—Various Systems of Separately Molded Reinforced Concrete Beam Construction.

The building of the Textile Machine Works was built by what is known as the Visitini System and was designed, and its erection by day labor supervised by the Concrete Steel Co. of New York. This building is described in detail in the excellent work written by Sanford E. Thompson, and published by the Atlas Portland Cement Co., entitled "Reinforced Concrete Factory Construction," from which the following brief description is taken. The cost of the concrete frame and floors, exclusive of curtain walls and finish, was found to be about 80 cts. per sq. ft. of floor area, not including cost of engineering and general expense. While this price would not be considered particularly low for concrete construction, the design of the members is such that they are rather expensive to fabricate; in fact 25 per cent of this cost was for forms, and carpenter work setting them up. For this reason this building did not give a proper comparison of the cost of the two methods. On the other hand, the buildings of the Edison Portland cement Co. (Engineering-Contracting, Oct. 2, 1907, and March 18, 1908), constructed by the unit system, showed an abnormally low cost. It will be remembered that this structure was a single story mill building, 144x360 ft., with 32-ft. columns, 24-in. girders and 12-ft. roof slabs, all made in the field, and the concrete members were made and erected for $6.60 per cu. yd. On account of special facilities for erection and handling, such tracks and locomotive cranes, and owing to the fact that raw materials were especially cheap (cement was taken at $1.00 per bbl., crushed stone 60 cts. per yd.), the unit cost per yd. for this structure is doubtless less than it would ordinarily be for such work, but even with the proper charges for plant rental and depreciation, and the usual cost of materials, and other fixed charges that any contractor doing similar work without special facilities would have, it would seem to indicate that $8 per cu. yd. for concrete in place would surely have covered the cost under average conditions. Cost of monolithic structures similar to this indicate plainly that the building could not be constructed by that method for anything like this price.

The car barns of the Central Pennsylvania Traction Co., designed and constructed during the previous summer under the supervision of Mason D. Pratt, City and Consulting Engineer of Harrisburg, Pa., is of exceptional value for the comparison of cost of these two particular types of construction, since four years previous an identical building was constructed by the monolithic system. (A full description of this structure with costs from information furnished by Mr. Pratt, was published in Engineering-Contracting of Jan. 19, 1910, and Mr. Watson's brief description is omitted.—Editors.) Mr. Pratt found that the cost of the monolithic building was 15 per cent greater than for the building constructed of separate units, the cost per cubic yard being about $9.25 for the unit building.

The author during the previous summer designed and supervised the erection of a unit concrete frame for a building which was somewhat similar to the above, in which he found the cost per cubic yard to be $20.40 erected. The difference in cost is doubtless due to the fact that the volume of concrete in the work was much smaller, and that the design was more complicated. The structural frame of this building consisted of columns, roof and crane girders, for a building 250 ft. long by 45 ft. wide, columns spaced 18 ft. centers. On account of the unusual poor foundations, it was necessary to design this frame as an articulate skeleton to prevent the settlement from causing damage. It seemed best for this reason to make the frame of structural steel, or separately moulded concrete members, as the cracking of the monolithic members from settlement might have proved serious. Bids were taken on a steel frame designed using Bethlehem beams for roof supports and columns. The actual cost of the frame erected in concrete was found to be almost identical to the lowest bid for structural steel frame, but the latter would not have been fireproof. The connections of the members in this structure were designed much like timber connections, i. e., by bolting together.

The notable feature of this work is the size of the roof girders. These were designed with the expectation that the building would be constructed with a concrete roof, but it was finally decided to put on a temporary timber roof. All girders are 43 ft. over all with clear span of 40 ft., weighing about 6 tons. They were paneled to reduce weight, and make a more economical section. All members were made in wooden forms, and for the reason that the amount of material was comparatively small the concrete was all mixed and placed by hand. The building, like the Harrisburg

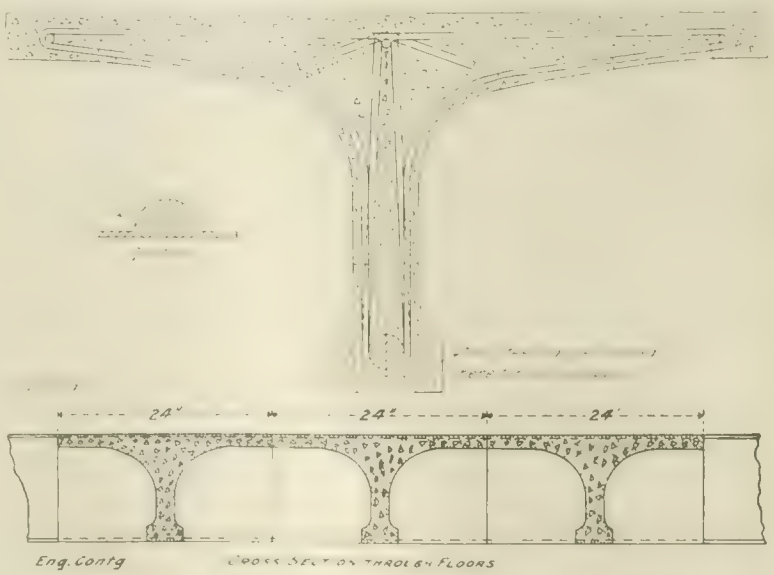

Fig. 2.—Details of Watson Separately Molded Beam and Sketch Showing Method of Assembling.

car barns, was erected with an ordinary stiff leg derrick. Table I shows the detailed cost and comparison with the cost of steel frame.

The most extensive use of separately moulded members has been in fireproof floor construction, where the members are made to take the place of terra cotta, or concrete fireproofing, and are usually manufactured in an established factory, where all the economies of manufacturing can be had. Such members are usually made in as large units as are convenient to handle in the field, and all of comparatively long spans. The beam is designed, and the concrete moulded in the most economical shape to give maximum strength with the minimum material. There are several types of such floor construction now on the market in Europe and America; the more prominent of which are illustrated by Fig. 1.

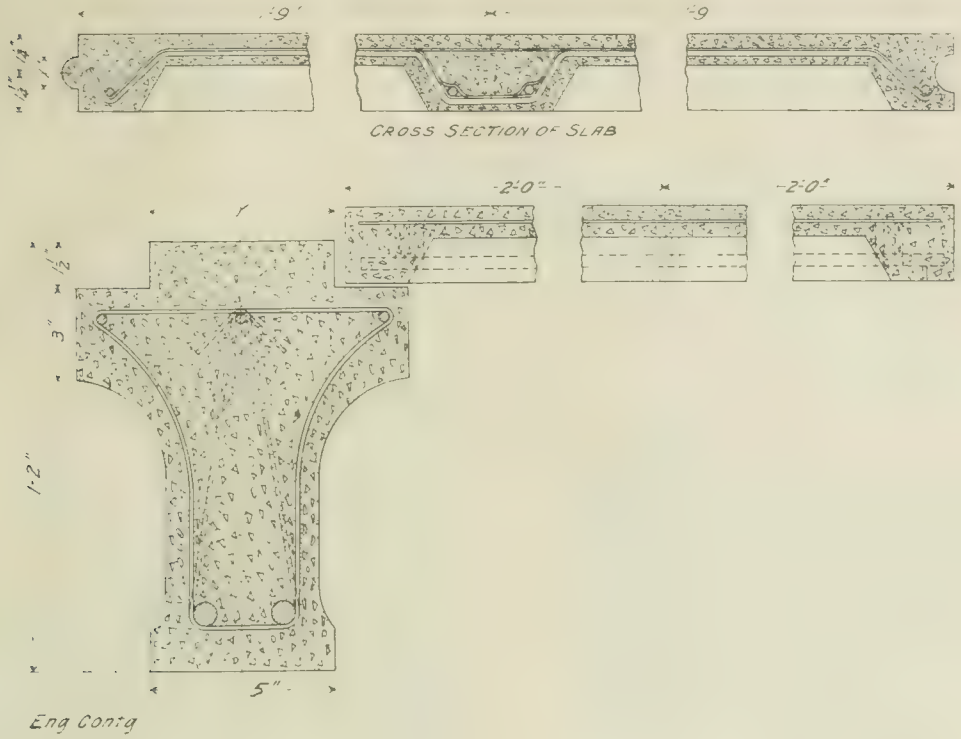

Fig. 3.—Details of Watson Combined Slab and Beam Construction of Separately Molded Members.

The first is what is known as the Seigwart System, designed by Hans Seigwart, an architect of Luzerne. Mr. Seigwart claims that there are over 50 factories throughout Europe making this type of floor, and that the Luzerne factory are manufacturing over a million feet per year. The only factory in Americ where these beams are made, known by the writer, is located at Montreal, Quebec; the company being comparatively new. The second system is what is known as the Armoured Tubular and is used extensively in England. The third, which is known as the Climax System, designed by S. M. Randolph, Chicago architect, and marketed by the Climax Co. of that city. The fourth, which is known as the Standard System, designed by and marketed by C. F. Buente, Pittsburg, Pa. The fifth, which is known as the Vaughan System, is marketed by the Vaughan Co. of Detroit, Mich. The sixth is a system designed by the author, and used by the Onondaga Litholite Co., Syracuse, N. Y., in some buildings recently constructed in that city.

Figure 2 shows the details and sections of the types of floors designed by the author for several buildings recently constructed by the Onondaga Litholite Co., Syracuse, N. Y. For long span and heavy loads, the T-sections are used, laid side by side. The width of the flange depending upon the space that beams are to fill, the load and span. For roofs and all floors having span less 20 ft. and loaded less than 200 lbs. per sq. ft., the combination of a slab and T-beam is used, the beams being spaced about 4 ft. centers, as shown by Fig. 3. The slabs are then laid between the beams and grouted at the joints. This particular design has worked out very satisfactorily and economically in actual construction, as it allows of great variation of design, and diversity of finish. Suspended ceilings are easily attached if desired, but the members themselves look very nice properly pointed and given a cement wash. This floor illustrates admirably the economy of weight of such construction; the beams were 22 ft. long, having about 19 ft. clear span, spaced 4 ft. 6 ins., C. to C., the floor carrying a load of 150 lbs. per sq. ft. and has been tested to 600 lbs. The total dead weight of this floor is but 37 lbs. per sq. ft., and the weight of the steel 2¾ lbs. per sq. ft., If the amount of concrete were reduced to slab form it would be less than 3 ins. thick. It is doubtful if any designer would attempt to build a flat slab of this length to sustain the same load with less than twice this thickness with the same amount of reinforcement.

Table II shows the comparison of dead loads and weights of steel per square foot of various floor systems now most extensively used, with a floor similar to the one just described. The comparison is made for the same span and load using the same values for the strength of steel and concrete.

Without taking time to give itemized cost of such floors actually constructed the writer would say that he has found it to vary from 15 to 30 cts. per sq. ft. erected, depending upon the various conditions of load, span and delivery. The average cost of steel fabricated is a little less than 2½ cts. per lb. in place, based on the present market value, showing that the cost of the concrete members vary from 50 cts. to $1.00 a cu. ft., not including steel. This price is very much greater than the cost of making and placing concrete blocks, and almost as great as for ornamental stone and it would indicate that a large reduction could be expected as the methods of manufacture are perfected, but even at this price they compare quite favorably with the cost of monolithic floors, for same spans and loads.

Figure 4 shows the method employed in making these beams. The slabs are made on edge in steel forms, each form containing 350 sq. ft. of slabs. The concrete is driven into place and around the reinforcement by means of a special jarring or vibrating machine.

In the construction of several buildings built for the Syracuse Cold Storage Co., the T-section beams were used for all floors, and the beam and slab construction for the roof; this was done on account of the heavy load the floor had to sustain, being 300 lbs. per sq. ft. and no floor being allowed in any case to touch the wall. One of these buildings, the main storage warehouse, is an excellent illustration that this type of floor construction, in conjunction with the reinforced, or fireproofed steel frame, is not only practical for buildings of considerable height, but economical as well. This building was a six-story and basement warehouse 78 ft. square. The building was originally designed for mill construction, but alternate bids were taken for monolithic concrete, and steel frame fireproofed, using sectional floors. The bid for the latter construction was considerably the lowest; in fact both bids were less than cost of the mill construction. On account of time and delivery and certain insulation details, it was found impractical to design steel work as ordinarily would be done for such a structure, i. e., using sufficient steel to sustain the dead load during

Fig. 4.—View of Forms for Casting T-Beams Shown by Fig. 2.

TABLE I.—DETAIL COST OF STRUCTURAL FRAME PLANT OF THE ONONDAGA LITHOLITE CO., SYRACUSE, N. Y., BUILT DURING 1909.

Reinforcing steel, bolts and wind bracing	$ 952.77
Lumber for forms	325.17
Concrete materials	488.83
General supplies	65.00
Labor of making and erection	899.60
Power, interest, plant and other general charges	250.00
Total	$2,981.37

Cu. yds. of concrete—148.
Cost per yd., $20.40.
Lowest bid for alternate design for steel frame erected, $3,000.

TABLE II. — SHOWING RELATIVE DEAD LOAD AND WEIGHT OF STEEL UNIT VS. PRESENT STANDARD FIREPROOF FLOOR CONSTRUCTION.

(Assumed span, 16 ft.; superimposed load, 150 lbs. per sq. ft.; tension in steel, 16,000 lbs. per sq. in.; compression in concrete, 630 lbs.; shear, 50 lbs.)

Description.	Dead load per sq. ft. Lbs.	Wt. steel per sq. ft. Lbs.
Flat slab	96	3.75
Concrete and tile	72	2.77
Slab and beam	56	2.41
Terra cotta	55	5.4
Unit slab and beam	45	2.75

erection, and so designed that the addition of the field concrete the member would be strong enough to carry live load with proper factor of safety; as has been done in several buildings with which you are all familiar, the most well known probably being the MaGraw Building in New York. The steel was therefore designed as would have been done if terra cotta fireproofing had been used.

The walls were 12-in. curtain walls. In order to get flat ceiling the supporting girders were all made of Bethlehem special girder beams. The concrete floor sections for this one building were transported by rail to the building, but for the other buildings they were delivered by team, and the cost was found to be about the same. They were unloaded by means of a boom attached to the frame, power being furnished by a gasoline hoist. They were distributed about the building and set in place by means of chain hoists on portable I beam trolleys, as shown by Fig. 5. The top flange of one beam in each panel was coped to allow the beams to enter, and the beams were slid into position on the lower flange, after which it was wedged up level, pointed underneath, the projecting reinforcement tied over the top flanges, and the spaces between the ends and edges grouted in solid.

It must be remembered that the building was designed for comparatively heavy loads, each floor except the top had to carry 300 lbs. superimposed. Tests were made on sections at regular intervals during manufacture and in no case did a beam fail, loaded with less than 900 lbs. per sq. ft., tested at an age of 21 days. The spans averaged about 15 ft. 3 ins. and the depth of all floors was 12 ins. The dead weight, not including the insulation and its protection, was 40 lbs. per sq. ft. The cost of the floors, as shown in Table III, was found to be 20½ cts. per sq. ft. erected; the cost of the steel frame and fireproofing about 21½ cts. per sq. ft.; the cost of engineering and superintendence about .02 cts. which should be proportioned about equally between the floors and frame, making a total cost of the floors 21½ cts. and the frame 22½ cts. per sq. ft., or a total of only 44 cts. per sq. ft., or 4 cts. per cu. ft. of volume for both frame and floor. It should be noted that this square foot measurement is the net floor area for the six floors and basement computed by the inside dimensions of the building.

On the same basis of costs found to obtain on this building it can be shown that a building of equal size designed to carry the same loads, but in which the peculiar conditions required in cold storage warehouses are not required, and designing the frame as the usual reinforced concrete structural steel frame is designed, could have been built for .57 cts. per sq. ft., or .05½ cts. per cu. ft.

The various advantages of such construction as outlined in the beginning of this paper, were well demonstrated in this building. In regard to speed of erection, it was found that four men and one engineer could unload and place about 1,500 sq. ft. of floors in an 8-hr. day; union iron workers being used for this work and paid at the rate of 50 cts. per hour. The building was found to be quite as rigid as any steel frame building with terra cotta or concrete floors and a section of floor was altered to make room for a scale pit on the ground floor in a very short time and at a small cost.

Fig. 5.—View Showing Method of Placing Separately Molded Slabs.

TABLE III.—DETAILED COST OF STORAGE WAREHOUSE SUPERSTRUCTURE, SYRACUSE COLD STORAGE CO.

(Building 78x78 ft. Steel frame, fireproofed, having basement, six storage floors and concrete roof. Floors designed for 375 lbs. total load. Total area of floors, 10,152 sq. ft. Volume, 424,480 cu. ft.)

	Cost.	Cost per sq. ft.	Cost per cu. ft.
Concrete materials in floors. Cement at $1.40 bbl.; stone at $1.10 ton	$ 1,156.30	$0.028	
Reinforcing steel in floors, f. o. b. shop	1,454.40	0.036	
Labor fabricating reinforcement	[illegible]	[illegible]	
Labor making floor sections and roof	2,605.69	0.064	
Labor erecting members	[illegible]	0.040	
Hauling and freight on members from factory (2 miles)	382.57	0.008	
Power, erection, tools and supplies	217.40	0.005	
Fixed factory charges, including power, interest and depreciation	500.00	0.012	
Total for floors in place (not including painting or grouting)	$ 8,283.89	$0.205	$0.0196
Structural steel erected	$ 7,050.00		
Materials for concreting floors and fireproofing steel	244.84		
Labor painting and concreting floors and fireproofing steel	1,149.00		
Lumber for forms used in fireproofing steel	150.00		
Freight delivery and cartage on field materials	50.00		
Tools, power and supplies	100.00		
Total for frame and fireproofing	$ [illegible]	$0.216	$0.0206
Engineering and superintendence	$ [illegible]	$0.019	$0.001
Total for floors, frame and fireproofing	$17,826.26	$0.44	$0.041
Brick curtain walls, stairs, trim, felt and gravel roof, and all other work to complete superstructure	$ 6,904.76	$0.17	$0.016
Total cost of superstructure	$24,731.02	$0.61	$0.057

Cost of the Philadelphia Filtration Works.

The first contract in connection with the Improvement Extension and Filtration of the water supply was made in 1900 for an experimental filter plant, but work did not begin on any of the permanent structures until 1901. Since the starting of the work about 170 contracts have been executed, covering about every class of work and material entering into water works and water purification construction. They embrace almost every type of pumping engines from a single centrifugal low service pump to a triple expansion high duty engine of the most modern design, as well as steam turbines driving single and double stage centrifugal pumps and electric generators; compound high speed engines, traveling cranes, locomotives, coal handling machinery, structural steel, buildings, tunnels, conduits and concrete work in almost all its forms.

Below will be found in round numbers the cost of the filtration work and its adjuncts, additions to the distribution system, also repairs made to machinery in the old pumping stations. These figures do not include land damages, expense incurred at the experimental station and administrative expenses, but do include the cost of engineering, inspection and such incidental expenses:

Lower Roxborough filters	$ 480,000
Lower Roxborough preliminary filters	100,000
Upper Roxborough filters	1,080,000
Belmont filters	2,480,000
Belmont preliminary filters	212,000
Belmont sedimentation basin	600,000
Torresdale filters	7,100,000
Torresdale preliminary filters	1,160,000
Torresdale intake	225,000
Torresdale pumping station, including buildings and pumps	723,000
Torresdale conduit	1,635,000
Lardner's Point pumping station, buildings and pumps	2,800,000
Oak Lane Reservoir	665,000
Distribution system	5,250,000
Repairs to pumps and stations	1,500,000
Queen Lane filters and equipment	1,900,000
	$27,910,000
*Additional distribution system	250,000
	$28,160,000

The Atlantic Coast Line R. R. has started surveys to secure a route for a line from Kissimmee, Fla., to Alligator Bluff, on Kissimmee River, 55 miles distant.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Method and Cost of Making a 16,000-Cu. Yd. Blast on the Pecos & Northern Texas Ry.

BY C. S. YOUNG*

On the morning of March 8 there was fired what is conceded by railroad construction men of long experience, to be the largest blast in railroad construction that has ever been made in the state of Texas. This shot occurred on Mile 22 of the Pecos & Northern Texas Ry., a branch of the Santa Fe, known as the "Santa Fe cut-off."

Fig. 1.—View of 16,000-cu. yd. Blast From a Distance of 1,800 ft.

On the mile and a half of the construction being done by the Suderman-Dolson Co. of Houston, Texas, there is a fill containing about 90,000 cu. yds., the greatest height of which is 58.8 ft. at the head of bank, where the line crosses the Jim Ned Creek. The material for this fill is both borrowed from each side by machines and placed by wagons, and also hauled by cars from the big cut, a distance of about 4,000 ft. on an average. The big cut is a solid rock cut containing about 70,000 cu. yds. and the deepest cutting is 34.4 ft.

It was at the summit of this cut that the big shot was made. Eight holes were drilled on the center line, each being 22 ft. apart and ranging from 32 ft. to 37 ft. in depth. The first hole was about 18 ft. back from the crown of the preceding shot, the material of which had not been removed and still remained sloping down from the crown. This made quite a heavy pull for the first hole. The holes were drilled by a well machine, drilling a 4½-in. hole, at a cost of 50 cts. per foot. They were sprung three times, using 60 per cent dynamite; at the first 15 sticks were used, at the second from 50 to 60 sticks, and at the third from 250 to 300 sticks were used, springing the eight holes together. The tamping after each spring was drilled out by the well machine at a cost of $12 per day and requiring about twelve days altogether. The drilling out of the tamping after the last spring was almost as difficult as the original hole owing to slight raveling of some of the holes and to the slight shifting of some of the ledges of rock. In loading the holes FF and FFF black powder was used and they were loaded as follows:

	Kegs.
Hole No. 1	275
Hole No. 2	255
Hole No. 3	240
Hole No. 4	250
Hole No. 5	250
Hole No. 6	247
Hole No. 7	195
Hole No. 8	300

This makes a total of 2,012 kegs of 25 lbs. each, or 50,300 lbs. The total cost of the drilling, springing, dynamite, exploders, and powder was $3,725.

The total yardage of the cut that was broken by the shot was 16,113 cu. yds., and the measurement of the hole afterward showed a wasting of 12,007 cu. yds., or 74.5 per cent. As the holes were from 1.5 ft. to 2 ft. below grade it is reasonable to suppose that the 4,106 cu. yds. that were left at the bottom and on the slopes was loose material and if calculated with a 15 per cent swell for breaking there is the equivalent to 3,571 cu. yds. of solid material left from the shot. Calculated in this way there was a waste of 77.8 per cent of the cut at this part. At this writing the material has not been removed, but from the indications the slopes were not damaged in the slightest degree.

Fig. 2.—View of 16,000-cu. yd. Blast 15 Seconds After Firing.

The drilling, springing, and loading were done under the personal supervision of the writer and the battery was pulled by A. T. Warren, foreman of Camp No. 3, in charge of the work on the big cut.

*Superintendent of Construction, Suderman-Dolson Co., Atoka, Tex.

Methods and Cost of Cleaning 30,000 Cu. Yds. of Sediment from a Water-Works Reservoir.

The reservoir, known as Reservoir No. 1 of the Cincinnati, O., water works, had been in constant service for over two years. It was taken out of service on March 20, 1909, and allowed to stand for 4 days in order to allow complete sedimentation before drawing the water. The original turbidity of the water was 75 parts per million; after 4 days it was found to be 47 parts for a depth of 30 ft. and 50 parts at a depth of 40 ft. On March 30 the water was drawn off for a depth of 3 ft. during the night and allowed to stand during the day, when the mud was washed off the exposed slopes by hose streams under pressure of flushing pumps in the wier house. The following night the water level was again lowered to stand during the day, when the slopes were washed down. This procedure was repeated every 24 hours until April 9, when the water had become very turbid. The 30-in. drain was then opened, drawing off all the water and such mud as it carried. The deposit of mud remaining on the slopes and bottom was then disintegrated and slid to the drain opening by means of 1½-in. hose streams under heavy pressure. The depth of accumulated mud was found to be from 12 ins. to 36 ins. and the total amount removed was estimated as 30,000 cu. yds. Some 35,494,600 gals. of water were wasted in draining the reservoir and 16,902,600 gals. were used for removing the mud, or about 565 gals. per cubic yard of mud removed. The cost of cleaning was as follows:

16,902,600 gals. water, at $3.28 per mil. gals.	$ 55.44
22,032 kw. electric power, at 1.1 ct.	242.36
Labor operating pumps	57.94
Labor cleaning reservoir	427.27
Total	$783.01

The cost per cubic yard of mud removed was, for cleaning proper, 2.61 cts. Charging in the 35,494,600 gals. of water last in draining the reservoir at $3.28 per million gallons we have an additional item of $116.42, or 0.39 ct. per cu. yd., making a total cost of 3 cts. per cu. yd. The cleaning was completed May 1, 1909, and water was turned back into the reservoir on May 8. These data are computed from figures given in the report of Geo. H. Benzenberg, chief engineer, water works, Cincinnati, O.

Bids for Canal Excavation.—Bids for the excavation of a section of the Canal prism near Tabernilla, containing about 36,138 cu. yds., and a section near Bohio, containing about 166,272 cu. yds., were opened at the office of the Chief Quartermaster in Culebra, on March 1. An abstract of the seven proposals which were received follows:

Bidders.	Sec. A Tabernilla. Price per cu. yd.	Section B. Bohio. Price per cu. yd. Hard rock	Earth.	Soft rock	Hard rock.
Chas. Alberts	.30	.52	.42	.71	.92
B. B. Duncan	2 41/2	.34 1/8	.29	.50 1/4	.62 3/4
E. C. McFarland	.21	.26	.21	.25	.30
R. B. Stapleton	2 5 1/2				
R. P. Dixon	.24	.50	.40	.65	.80
George Forbes	2 2 1/2				
Hebard & Lombard	.27	.445	.257	.47	.64

Mr. McFarland was the lowest bidder in both sections.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Average Unit Prices and Some Details of Pavements Constructed in 1909 in a Number of Representative American Cities.

The accompanying tabulations show the amount and average unit prices for various classes of pavement laid in 1909 in a number of representative American cities. In securing these data no attempt was made to obtain complete statistics for the United States. The purpose, rather, was to select cities in various sections of the country on the assumption that their practice and activity would be representative of the section in which they were located. In order to give as much data as possible regarding the local conditions under which the pavement was constructed, information was secured on the prevailing local prices for paving materials and the local cost of labor. These labor and material tables will be found on pages 320 and 323 in this issue. Similar tables showing the character and cost of paving, work done in 1906, were given in an issue of March 27, 1907; and like information on the paving work done in 1907 was given in the April 1, 1908, issue of this paper.

On the blanks sent to the city officials information was asked on only the kinds of pavement most commonly constructed. In many cities, however, various other types of pavement than those shown in the accompanying tables were constructed last year, and in the following notes we give a brief description of some of these types.

The only pavement constructed last year in Annapolis, Md., was 5,146 sq. yds. of shell-macadam. This pavement consisted of 3-in. of oyster shells and 3 ins. of broken stone and was constructed by day labor at a cost of 55.6 cts. per sq. yd. The pavement was covered with Tarvia "A" by contract at 12 cts. per sq. yd., making the total cost of the completed pavement 67.6 cts. per sq. yd.

TABLE SHOWING AMOUNT AND AVERAGE UNIT PRICE OF STONE BLOCK PAVEMENT LAID IN 1909 IN A NUMBER OF REPRESENTATIVE AMERICAN CITIES

*Price does not include grading. †Laid by day labor.
[1]Curb on sand base, 8 ins. on slag base. [2]Price includes curbs, the drains, grading and all work complete. [3]Laid on gravel base. [4]Medina. [5]$3.33 on 6 in. concrete base, $2.79 on sand. [6]Laid on 6 in. sand base. [7]Laid on natural gravel base. [8]Including sand base. [9]New Belgian block; in addition there was 7,000 sq. yds. of Belgian block relaid at 50 cts. per sq. yd. [10]Blocks were taken up from other streets and relaid on a gravel base. [11]For limestone blocks; for granite blocks, 2,079 sq. yds. of which was laid the price was $2.34 per sq. yd. [12]12 in. and 14 in.. [13]Ligonier block on 9 in. gravel foundation. [14]Ligonier block repaving; laid on 6 in gravel foundation. [15]In addition there were 2,615 cu. yds. laid at $2.46 per sq. yd. on a base other than concrete. [16]Miles. [17]On sand base. [18]Granite. [19]Sandstone. [20]Labor only; old blocks relaid on different street. [21]On 9 in.; $3.10 on 6 in.

Three cities reported the construction of concrete pavement last year. These were:

	Sq. yds.	Price per sq. yd.	Total thickness. Ins.	Guarantee. Years
Boise, Idaho	10,000	$1.52	8	5
Kansas City, Mo.	7,340	1.00	6	5
Salt Lake City, Utah.	1,620	1.60	8	5

The prevailing prices for concrete materials in these cities were as follows:

	Portland cement. Per bbl.	Broken stone. Per cu. yd.	Sand. Per cu. yd.
Boise, Idaho	$ 2.75	$ 1.06	$1.00
Kansas City, Mo.	1.00-1.20	1.25-1.50	1.25
Salt Lake City, Utah.	2.00	1.25	1.25

A considerable amount of pavement made of broken stone mixed with tar or asphalt was constructed during the past year and brief notes on this work follow:

Cambridge, Mass., constructed by day labor 15,402 sq. yds. of tar macadam 6 in. thick, the unit cost per square yard being 75 cts; this cost including grading. Broken stone cost $1.75 per cu. yd.; common laborers were paid $2 per 8-hour day and $5 to $6 was paid per day for teams with drivers.

At Cedar Rapids, Ia., 39,000 sq. yds. tarvia macadam was constructed, the average price for 13,000 sq. yds. being 64 cts. per sq. yd., and the average price for 26,000 sq. yds. being $1.02. These prices do include grading, which was paid for separately at 23 cts. per cu. yd. The total thickness of the pavement is 12 ins. Broken stone cost $1.35 per cu. yd., common labor was paid $2 for 9-hour day and team with driver $4.50.

At Cleveland, O., 3,578 sq. yds. of 9-in. tar macadam was constructed by contract, the average price per sq. yd. being $2.27. The pavement guarantee was 10 years.

A total yardage of 52,743 sq. yds. of asphalt macadam was constructed in Fresno, Cal., in 1909, the average cost per sq. yd. being as follows:

9,217 sq. yds., 7 in. thick.....$2.02
17,219 sq. yds., 5 in. thick..... 1.35
26,307 sq. yds., 4 in. thick..... 1.12½

The guarantee was one year. Broken stone cost $1.00 per cu. yd., and asphalt $12.50 per ton.

Common labor was paid $2.50 per 8-hour day and team with driver $4.

At Hamilton, O., 6,142 sq. yds. of 6-in. tarvia macadam was constructed, the average price per sq. yd., including grading, being 65 cts. Broken stone cost $1.25 per cu. yd., and common labor was paid $1.50 to $1.75 per 10-hour day, while $4.50 was paid for team and driver.

At Haverhill, Mass., 46,845 sq. yds. of macadam treated with Tarvia "A" was laid by city labor at a cost of 82 cts. per sq. yd., this cost including grading. The total thickness of the pavement was 6 in. to 8 in. Com-

[1]Brick, [2]40,000 sq. yds. [3]Expects to pave business district this year. [4]15,000 sq. yds. of brick to be laid this year. [5]For repairs. [6]Several blocks. [7]Contract let. [8]1.08 miles new pavement, 4.27 miles repaving and 19.24 miles resurfacing. [9]1,170 sq. yds. brick and 4,300 sq. yds. granite. [9].76 miles new pavement and .77 miles relaid. [10]Including storm sewers. [11]80,000 sq. yds. [12]Contract let. [13]6.86 miles of new paving and 4.59 miles of relaid pavement. [14]Engineer of highways.

mon labor was paid $2.25 per 8-hour day and $5.00 per day was paid for a team with driver. Broken stone cost $1.10 per cu. yd.

A total of 17,731 sq. yds. of macadam was laid in Holyoke, Mass., in 1909, by day labor, at a cost of 63 cts. per sq. yd. Water gas tar was used on the top coat and the macadam was laid on a gravel base. Broken stone cost $1.30 per cu. yd. f. o. b. Holyoke; common labor was paid 25 cts. per hour and $4.50 per 8-hour day was paid for team with driver.

At Keokuk, Ia., 11,000 sq. yds. of 10 in. macadam filled with Sarco was constructed at an average price of 95 cts. per sq. yd., this price not including grading, which was paid for separately at 47 cts. per cu. yd. The pavement consisted of an 8-in. base and a 2-in. top filled with Sarco road compound. Broken stone cost $1.25 per cu. yd. on car and common labor was paid $2 per 10-hour; $3.50 to $4 per day was paid for team and driver. The pavement guarantee was one year.

Oiled macadam to the extent of 33,071 sq. yds. was constructed in 1909 at Leavenworth, Kan., the average price per sq. yd., not including grading, being 88 cts. Grading was paid for separately at the rate of 37 cts. per cu. yd. The total thickness of the pavement was 12 in. Broken stone cost $2 per cu. yd.; common labor cost $1.75 per 8-hour day, and $3.50 per day was paid for team with driver.

At Lewiston, Me., over 8,000 sq. yds. of tar-asphalt macadam was laid by the city at a cost of 85 cts. per sq. yd., this cost including grading. The pavement consisted of a layer of crushed rock 4 in. thick after rolling, and a layer of finer rock 2 in. thick after rolling, filled with 50 per cent tar and 50 per cent asphalt. The pavement was finished off with very fine crushed rock spread in liquid hot tar and rolled. Broken stone cost $2.20 per cu. yd.; common labor was paid $1.75 per 9-hour day, and $4 per day was paid for team and driver.

Madison, Wis., has awarded the contract for 40,850 sq. yds. of asphalt filled macadam to be built this year. The average price per sq. yd., not including grading, was $1.20. Broken stone costs $1.13 to $1.60 per cu. yd. and asphalt costs $25 per ton; common labor receives $2 per 9-hour day, and $4.50 per day is paid for team and driver. The total thickness of the pavement is to be 12 ins.

At Mankato, Minn., 2,290 sq. yds. of macadam treated with unrefined coal tar was constructed at a cost of 76.4 cts. per sq. yd. The total thickness of the pavement is 7 in. Broken stone cost 80 cts. per cu. yd.; common labor was paid $1.75 per 10-hour day, and $3.50 per day was paid for team with driver.

A total of 23,015 sq. yds. of 8-in. thick macadam was constructed at Muskegon, Mich., last year. Of this amount 15,035 sq. yds. was macadam, with a poured asphalt filler and 7,980 sq. yds. was macadam with poured tarvia filler. The average price for the former type of macadam was 94 cts. per sq. yd., and the average price for the later type was 84 cts. These prices do not include grading, which was paid for separately at 50 cts. per cu. yd. Broken stone cost $1.20 per cu. yd. loaded on wagon at dock; common labor was paid $1.75 per 10-hour day and $4 per day was paid for a team with driver.

At Norristown, Pa., the Borough by day labor constructed 37,580 sq. yds. of macadam; 34,169 sq. yds. were constructed with Tarvia "X" and 3,411 sq. yds. with Indiana asphalt. The average cost per sq. yd., including grading and base, was 58 cts. The bottom consisted of 6 in. of sand and on this was 6 in. of crushed limestone. Broken stone cost $1.55 per cu. yd., and $1.50 per 10-hour day was paid for common labor; $3 per day was paid for single teams with drivers and $5 per day for double teams.

Passaic, N. J., constructed 5,481 sq. yds. of asphalt macadam, the work being done by contract at an average price of $1.19 per sq. yd. The guarantee was one year, and the total thickness of the pavement was 6½ ins. Broken stone cost $2.10 per cu. yd., and $1.50 per 10-hour day was paid for common labor; $5.50 per day was paid for team and driver.

At Portland, Me., 8,807 sq. yds. of bituminous macadam having [illegible] asphalt and tar heated surface was constructed by day labor

TABLE SHOWING AMOUNT AND AVERAGE PRICE OF MACADAM LAID IN 1909 IN A NUMBER OF REPRESENTATIVE CITIES.

	Sq. yds.	Av. price per sq.yd. including grading.	Guarantee years.	Price per cu. yd. for grading if paid separately.	Thickness macadam. Ins.

[1]20.5 cts. to 36.2 cts. [2]4-in. to 8-in. thick. [3]8-in. and 10-in. [4]Includes on 6-in. gravel base. [5]Granite top. [6]10-in. to 12-in. [7]Cost in 1910 is much more than in 1909 owing to heavier grading and wide streets. [8]Day labor. [9]12-in. middle, 6-in. at sides. [10]4 to 6-in. [11]Resurfacing with crushed hard heads. [12]Miles. [13]Granite top. [14]Macadam and telford. [15]6-in. and 8-in. [16]Traprock. [17]60 cts. to 70 cts.

at an average cost of $1.03 per sq. yd. Broken stone cost $1.20 per ton, and asphalt cost $3.83 per bbl. Common labor was paid $1.75 per 9-hour day, and $5 per day was paid for double team and driver.

A total of 37,839 sq. yds. of macadam was constructed in 1909 at South Bend, Ind. Of this amount 26,478 sq. yds. was asphalt (Sarco macadam) and 11,361 sq. yds. was treated with Tarvia "X." The average price per sq. yd. for the former type was 90 cts. and for the latter the average price was 70 cts. These prices do not include grading, 40 cts. per cu. yd. for grading being paid in connection with the asphalt macadam and 25 cts. per cu. yd. in connection with the tarvia-macadam. The total thickness of both types of pavement is 8 in. Broken stone cost $1.25 per cu. yd. Common labor was paid $1.75 to $2 per 10-hour day; teams with drivers were paid $4 per day.

At Superior, Wis., 15,982 sq. yds. of tar macadam was constructed at an average price of $1.46 per sq. yd. This price did not include grading, which was paid for at the rate of 60 cts. per cu. yd. The total thickness of the pavement was 12 in. Broken stone cost $1.70 per cu. yd.; common labor was paid $2.25 per 10-hour day, and $5 per day was paid for teams with drivers.

At Toledo, O., 15,193 sq. yds. of macadam having a 6-in. base and a 2½ tarvia or equivalent wearing surface was constructed at an average price of $1.08 per sq. yd., this price not including grading, which was paid for at the rate of 40 cts. per cu. yd. The macadam was constructed by contract, the guarantee being five years. The total thickness was 8½ to 9 ins. Broken stone cost $1.05 per cu. yd. f. o. b. cars. Common labor was paid $1.50 to $1.75 per 8 or 9-hour day, and teams with drivers were paid 50 cts. per hour.

A total of 19,976 sq. yds. of bituminous macadam was constructed by contract at Utica, N. Y., in 1909, the average price per sq. yd. being $1.04, not including excavation, which was paid for at the rate of 44 cts. per sq. yd. The total thickness of the pavement was 9 in., the sub-base being 3 in. The guarantee was one year. Broken stone cost $1.25 per cu. yd., common labor was paid $1.60 to $2 per 8-hour day and $4 per day was paid for teams with drivers.

A summary of the amounts laid and the average prices of the various types of macadam enumerated above follow:

City.	Kind.	Amount laid. Sq. yds.	Total thickness. Inches.	Average price. Per sq. yd.
Cambridge,	tar-mac.	15,402	6	$0.75
Cedar Rapids,	Tarv.-mac.	13,000	12	.64
Cedar Rapids,	Tarv.-mac.	26,000	12	1.02
Cleveland,	tar-mac.	3,578	9	2.27
Fresno,	asp.-mac.	9,217	7	2.02
Fresno,	asp.-mac.	17,219	5	1.35
Fresno,	asp.-mac.	26,307	4	1.12½
Hamilton,	Tarv.-mac.	6,142	6	.65
Haverhill,	Tarv.-mac.	46,845	6	.82
Holyoke,	w. g. tar.	17,731	..	.63
Keokuk,	Sar.-mac.	11,000	10	.95
Leavenworth,	oil-mac.	33,071	12	.88
Lewiston,	asp.-mac.	8,000	6	.85
Madison,	asp.-mac.	40,850	12	1.20
Mankato,	coal tar.	2,296	7	.74
Muskegon,	asp.-mac.	15,035	8	.94
Muskegon,	Tarv.-mac.	7,980	8	.84
Norristown,	Tarv-mac.	34,169	6	.58
Norristown,	asp.-mac.	3,411	6	.58
Passaic,	asp.-mac.	5,481	6½	1.19
Portland,	bit.-mac.	8,807	..	1.03
South Bend,	asp.-mac.	26,478	8	.90
South Bend,	Tarv.-mac.	11,361	8	.70
Superior,	tar-mac.	15,982	12	1.46
Toledo,	Tarv.-mac.	15,193	8½	1.08
Utica,	bit.-mac.	19,976	9	1.04

At San Jose, Cal., 14,150 sq. yds. of asphaltic concrete pavement was constructed, the average price per sq. yd., including grading and base, being $1.48. The total thickness of this pavement was 5½ in. The base was 4 in. thick, composed of 6 to 7 lbs. of asphaltic cement to 1 cu. ft. of aggregate. A total of 18,316 sq. yds. of bitumen pavement was constructed in this city, the average price including base and grading being $2.10 per sq. yd. The total thickness of this pavement, including the base, was 8 in. The base was 6 in. thick, made of 1-3-6 Portland cement concrete. Common labor was paid $2 per 9-hour day, and team and driver $5 per day. Cement cost $2.20 per bbl. Broken stone cost $1.60 per cu. yd., sand cost $1 per cu. yd., and asphalt cost $15 per ton. No guarantee was required.

At Springfield, Ill., 12,684 sq. yds. of asphaltic concrete was constructed, the average price, including base and grading, being $1.48 per sq. yd. The total thickness was 6 in., and the guarantee required was five years. In addition 12,625 sq. yds. of mineral rubber asphaltic concrete pavement was constructed in Springfield. The average price for this pavement, including base and grading, was $1.85 per sq. yd. The total thickness was 8 in., of which 6 in. was the 1-3-5 Portland cement concrete base. The guarantee was five years. Broken stone cost $1.20 per cu. yd. Cement cost 98 cts. per bbl., sand cost 75 cts. per cu. yd., and asphalt cost $22 per ton. Common labor was paid $1.80 per 9-hour day and $4 per day was paid for team and driver.

At Trenton, N. J., 3,505 sq. yds. of "Filbertine" pavement was constructed, the average price, including base and grading, being $1.50 per sq. yd. The total thickness of the pavement was 5½ in., which includes the 4 in. 1-3-6 Portland cement concrete base. The guarantee required was five years. In addition 2,198 sq. yds. of "Filbertine" resurfacing 1½ in. thick was laid on a Belgian block base, the average price per sq. yd. for this resurfacing being $1. Common labor was paid $1.60 per 10-hour day, and $5 per day was paid for team and driver. Portland cement cost $1.50 per bbl., broken stone cost $2.10 per cu. yd. and sand cost $1.33 per cu. yd.

The tables showing the amount and average unit prices of asphalt pavement, creosoted wood block pavement, and brick pavement laid in 1909 in representative American cities will be given in our next issue.

Uniform Municipal Reports.—The Bureau of Statistics of Massachusetts, Charles F. Gettemy, director, has issued Municipal Bulletin No. 1 in accordance with an act of the last legislature whereby the duty is imposed on him of prescribing forms or schedules for uniform annual returns, giving detailed classified receipts and payments, debts, assets and liabilities for cities and towns. The bulletin follows the statutes which have been passed from time to time regarding the legitimate operations of municipalities, and thoroughly analyzes and classifies them, with reference to act and section. With each item is given an explanation of the entries which must be made under it, so that the municipal accounting officer can find out exactly where to put every sum representing a receipt or expenditure, and just how to make the balance sheet for his corporation.

TABLE SHOWING AMOUNT AND AVERAGE UNIT PRICE OF BITULITHIC PAVEMENT LAID IN 1909 IN A NUMBER OF AMERICAN CITIES.

	Sq. yds.	Av. price per sq. yd., including base and grading.	Guarantee. years.	Price per cu yd. for grading if paid separately.	Total thickness of pavement, including base.	Concrete base. Thickness, ins.	Concrete base. Proportions

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

The Groined Arch in Filter and Covered Reservoir Construction.*

The groined arch for reservoir and filter roofs has been frequently described in good articles (as for example that by Mr. Leonard Metcalf in the Transactions of the American Society of Civil Engineers for 1900, with valuable discussions by W. B. Fuller and others) and the writer's only excuse for this paper is his participation or acquaintance with the

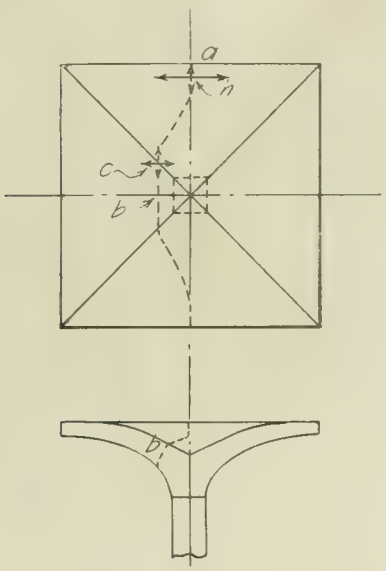

Fig. 1.

design of a number of recent important plants in connection with which fresh consideration has been given to old problems. Incidentally some useful data, mainly drawn from other papers, but extended where convenient, are collected in the paper.

The simple beam, the continuous girder, the simple arch with parallel ends, the retaining wall, and the suspension bridge, all handed down to us through generations of empirical engineering and architecture, succumbed a comparatively long time ago to the analysis of the theorist—at least so far as to yield passable hypotheses on which to tabulate the result of experience, thus permitting confident interpolation or extrapolation for new problems. The groined arch, though used centuries ago, remains a purely empirical type of structure, designed, or speaking more accurately, drawn, without satisfactory mathematical analysis and used without much knowledge of the factor of safety.

The groined arch has long been used in the architecture of public buildings, probably at least since the second century A. D., but its use in engineering structures has been greatly augmented in the last fifteen years by the advent of the covered slow sand filter plant and its attendant filtered-water reservoir, where the purified water is kept free from the algae-stimulating sun. To Mr. William Wheeler of Boston is due the credit for first using the groined arch in this country in water-works construction, the initial plants embodying it being the filters at Somersworth, N. H., and Ashland, Wis.

The reasons other than precedent for this use of the groined arch are in part as follows: (*a*) Absence of air pockets, thus permitting perfect ventilation. (*b*) Economy and simplicity, no reinforcing being used for ordinary conditions. (*c*) Uniform head room both longitudinally and transversely, thus permitting wires for lighting, and pipes or other devices for handling sand to be run level in either direction without waste of head room; also permitting economical lighting.

In 1903 Mr. Leonard Metcalf listed the groined arches in this country with their dimensions and other data, and that list was published in *Engineering News*, Dec. 24, 1903. The following Table I is extended from that of Mr. Metcalf's, the additions including, however, only certain of the larger recent works.

The commonest form of groined arch roof is one in which the intrados is composed of intersecting semi-elliptical cylindrical surfaces and the extrados of intersecting parabolic cylindrical surfaces. The ellipses and parabolas are generally the same in both longitudinal and transverse arches, but are sometimes different when some special dimension is to be matched in each direction. The floors under piers are generally parabolic groins. The following formulas for volume (Fig. 1) of

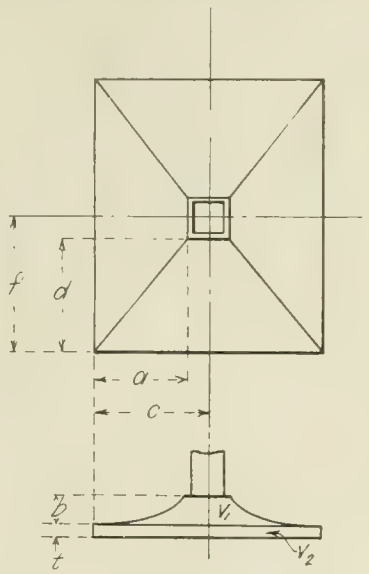

Fig. 2.

such groins were obtained from Mr. John H. Gregory, who worked them out with Mr. W. B. Fuller, while they both were resident at the Albany filter plant for Mr. Allen Hazen.

m = vol. included between plane through top of pier and plane tangent to intrados at crown.

n = vol. of parallelopiped included between planes parallel respectively to intrados and extrados at crown, *i. e.* apart vertically.

p = vol. included between extrados of arch and plane tangent to extrados at crown.

$v = m + n - p$

$m = 4b\ [cf + 2nd/3 - \pi/4\ (cd + af)\ ]$

$n = 4\ fct;\ p = 2/3\ fch.$

If the groin is square as is usual, $a = d$ and $c = f$; $m = 4b\ [C^3 + 2a^3/3 - \pi/2\ ac]$; $n = 4c^2t$; $p = 2/3\ c^2h$.

The floor of filters and covered reservoirs has usually been made of groin units similar to those used in the roof, but inverted, having parabolic instead of elliptical intrados, and having a flat instead of parabolic extrados because of resting on the ground. Mr. Gregory's formulas for volume (Fig. 2) of such units is as follows:

$v = v_1 + v_2$

$v_1 = 4b\ [cf - 2/3\ (af + cd) + ad/2]$

$v_2 = 4\ cft$

If groin unit is square, that is if $d = a$ and $f = c$

$v_1 = 4b\ [C^2 - 4/3\ ac + a^2/2]$

$v_2 = 4C^2t.$

Mr. Gregory has also developed formulas for the most economic shape of filter bed for use in sub-dividing a given area of filter surface into units of a given area. The economy is largely a matter of diminishing length of dividing and marginal walls and is not directly concerned with the roof, which is fixed, except at sidewalks, by total area. There are generally conditions of local topography that fix the layout within rather close limits. Nevertheless it is useful to remember that shape of beds affects economy.

In using Mr. Gregory's table it is necessary to obtain the ratio between cost of dividing walls and cost of outside walls per foot. In the latter cost must be included extra filling both for refill and embankment, also extra excavation to permit placing and to provide material for the extra embankment. With side walls of aqueduct section in ordinary cases this will result in a ratio of about 1 and the economical shape will have width 6/10 to 8/10 of the length, if there are six or more beds.

(*b*) Piers have generally been square but a tendency is noticeable to make them circular. (See, in order of date, lines 38, 40, 28, 29, 35, 41 of Table I). The circular pier has the advantage in construction that a thin sheet iron form can be used. It also gives a more effective distribution of material in the column. It causes a little complication at its junction with the square base of the roof groin unit but this is not serious as the corners of the roof groin base can be easily chamfered just above the pier by stucco blocks, so as to fit the circular top of the pier. Piers of the earlier fillers were enlarged by steps, where in the filter sand, to prevent direct passage of the water without proper filtering. The more recent filters have flaring bases but not steps. Walls of filters have gone through a similar development, batters being used where there were formerly steps.

Returning now to the matter of design, there are several methods of considering the groined arch roof as a support for vertical loads:

(A) The groined arch is often considered as a series of cylindrical arches (Fig. 3) cut off diamond-shape by the groin lines so that only these parts, *bb*, opposite the piers are full-centered, the balance being segmental of length constantly less as the intersections, *a* of groin lines are approached, this length being zero at these intersections. The arch forces traveling down the segmental arches meet corresponding forces from adjacent arches at the groin lines at an angle of 90° and are supposed to have a resultant, acting down the groin line into the pier. This method car-

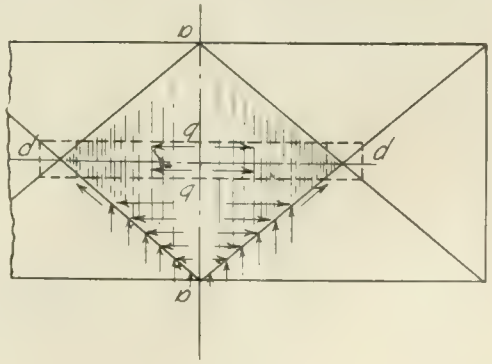

Fig. 3.

ries with it the thought that the arch should be thickened along the groin lines, *a p*, since otherwise there would be no arch to carry the diagonal resultants except what was filched from the adjacent segmental arches. Architecture has many examples of such thickening along the groin. Many of the engineers who design groined roofs, draw lines of resistance by the methods of graphical statics for the full-centered portion of the arch and assume that the segmental portions take care of them-

*From a paper by Thos. H. Wiggin read at the 1910 convention of the National Association of Cement Users.

Table I. Data on Groin Arch Roofs for Filters and Reservoirs

Ref. No.	Date	Location	Description	Area	Depth	Concrete	Steel	Piers Spacing & Size	Vol. used in Piers per Sq. Ft. Roof	Max. Pressure per Sq. Ft.	Cost per Sq. Ft.	Dead Load per Sq. Ft. allowed for Design	Intrados	Spring Line	Key	Remarks

selves somehow down the groin lines without strengthening under the groin. Without an elastic theory for the groined arch it is impossible to compute with any mental satisfaction where the true line of resistance goes, ever assuming the rigidity of abutments. Lines of resistance are generally drawn so as to start at the crown at a point distant from the center of thickness by one-sixth that thickness. This results in a maximum compressive stress twice as great as the average, in accordance with the well-known middle-third theory. Figure 4 shows the result of a line of resistance drawn for the full-centered arch of the filtered water reservoir, Pittsburgh, Pa.

(B) The next method is best conceived of if one imagines the arch cut vertically along the groin lines. (Fig. 5.) The stresses in the segmental portion of the arch are conceived as converging gradually as the pier is approached. Or, in other words, the thrust from the segmental arches is converged over gradually to the full-centered part opposite the pier. Fig. 6 shows result by this method applied to the roof of the filtered water reservoir at Pittsburgh, this being comparative with the result of Fig. 4 mentioned above. The crown thrust is about three-fourths as great as is the barrel arch method.

(C) The next method consists in considering each square groin unit as a cantilever or inverted dome just as if no bearing existed with the adjacent groin units. (Fig. 7.) These are really two methods as the dome idea places the groin unit entirely in tension whereas the cantilever has tension and compression on any vertical or approximately vertical section just as in a beam. The concrete in the top of the arch at a point such as *h* would seem to have tension in two principal directions at right angles to each other as shown by the arrows and of intensities having something like the ratio indicated by length of arrows. By the "theory of elasticity" these tensions at right angles would each reduce the effect of the other in rupturing the concrete. Similarly on the under side, the compressions would aid each other. The magnitude of the effect due to similar stresses at right angles is considered as ⅓ or ¼: for example, a tensile strain in one direction will cause a compressive strain of ⅓ or ¼ its intensity, in a direction at right angles, and by that amount will diminish any tensile strain existing or tending to exist in this plane at right angles. The truth of this theory may be seen qualitatively by pulling in two directions on a wide rubber band. At point *a* stress apparently exists only in one direction, and at a point like *c* on the groin line equal stresses in each direction would exist. It is hard to see how the reduction in maximum strain could be over 1/6 to 1/8.

As for the dome conception, the groin unit is not well adapted for such action, being square instead of round and requiring sharp changes of direction in tying stresses at the groin lines. Tests, to destruction, made under the writer's direction, of several groin units 15 ft. square and standing unsupported on all sides, showed that the initial crack always came at the middle of one of the sides. The weakest section, while not exactly determinable, is probably about as shown by line *a b c a* Fig. 7. Fig. 8 shows a computation on this cantilever basis of the strength of the groin units of the filtered water reservoir,

Pittsburg. The exact determination of all loads acting on the cantilever and their centers of gravity is too burdensome to be justified in so crude a method. Fairly close approximation can be estimated, however, as will be evident from the following explanations.

Computation of Grain Unit as Cantilever (See Fig. 8): The Pittsburg filtered water reservoir was planned for a filling varying from 4½ ft. at the road in center down to about 4 ft. at the edges. It has actually only 3 ft. filling. In Table I the loading is taken as 3 ft. at 110 lbs. + 15 lbs. of snow, following out Mr. Metcalf's methods: total load 345 lbs. per sq. ft. In Tables II and III the results are carried out both for the actual loading on the above assumptions and for 4 ft. of filling at 100 lbs. plus 100 lbs. live load, the latter agreeing more nearly with assumptions used in design and also making the figures comparative with those of Mr. Caslerls arch computations given in Fig. 6. The loads and lever arms referred to the assumed surface of fracture are as follows:

Weight of Concrete: Half the groin unit less that part at pier within line of fracture. From Table I, average thickness 8.2 ins.

Wt. of ½ groin $\frac{8.2 \times 18 \times 9 \times 150 \text{ lbs}}{12} =$ 16,600 lbs.

Weight of pier to be deducted (dimension scaled from Fig. 8): irregular figure assumed to be a trapezoid):

Upper base 1.7 × 6 =	10.2
4 × midsection = 4 × 1.6 × 3.2 =	20.5
Bottom section = 1.125 × 2.25 =	2.5
Total	33.2

$\frac{33.2 \times 2.8}{6} \times 150 \text{ lbs.} = 2{,}300$

Net dead weight outside of surface of fracture = 16,600 — 2,300 = 14,300.

Lever Arm (eye estimation) 3.75 ft. equals 45 ins.

Earth Filling in Hollow Over Pier: Total quantity equals 4.34 cu. yds. (See Table I). From ½ of 4.34 yds. subtract part within line of fracture. (Dimensions are scaled from Fig. 8; irregular figure assumed to be a trapezoid):

	Lbs.
½ × 4.34 × 27 × 100 lbs =	5,860
Upper base 6 × 1.5 =	9.0
4 × midsec. = 4 × 5.6 × 1.4 =	31.4
Lower Base =	0.
Total	40.4

$\frac{40.4}{6} \times 2.17 \times 100 \text{ lbs.} =$ 1,460

Weight of earth filling in hollow and outside of surface of fracture = 5,860— 1,460 = 4,400

(Second assumption). Weight of same if assumed 110 lbs. per cu. ft. = 4,800

Lever arm (eye estimation) 2¼ ft. = 27 ins.

Four ft. of earth filling at 100 lbs. above plane through extrados at crown plus 100 lbs. live load:

Part outside of surface of fracture = (18 × 9-6 × 1.5) at 500 lbs. = 76,500 lbs.

(Second assumption). Three ft. of earth filling at 110 lbs. plus 15 lbs. snow load = (18 × 9-6 × 1.5) at 345 lbs. = 52,800 lbs.

Lever arm estimated at 4 ft. = 48 ins.

The tensile strength at the critical point at the top of the groin may be obtained by the usual formula for beams:

$f = \frac{My}{I}$ where f is the stress desired.

M is the moment, in inch lbs., of the loads.

y is the vertical distance from the center of gravity of the surface of fracture to the point where the stress is desired.

I is the moment of inertia of the surface of fracture. In the computations the projections of this surface is used and lever arms are measured from a point about 1 ft. out from the center of pier. Approximations are unavoidable.

The computations and results are shown in Tables II and III. It will there be seen that the dead load of the concrete alone results in a stress of about 65 lbs. per sq. in., while the 500 lbs. per sq. ft. and 345 lbs. per sq. ft. loadings above the extrados resulted in 460 and 340 lbs. tension respectively. It is therefore not surprising that the test groin units, standing alone break of their own weight or with at most a load of 200 lbs. per sq. ft.

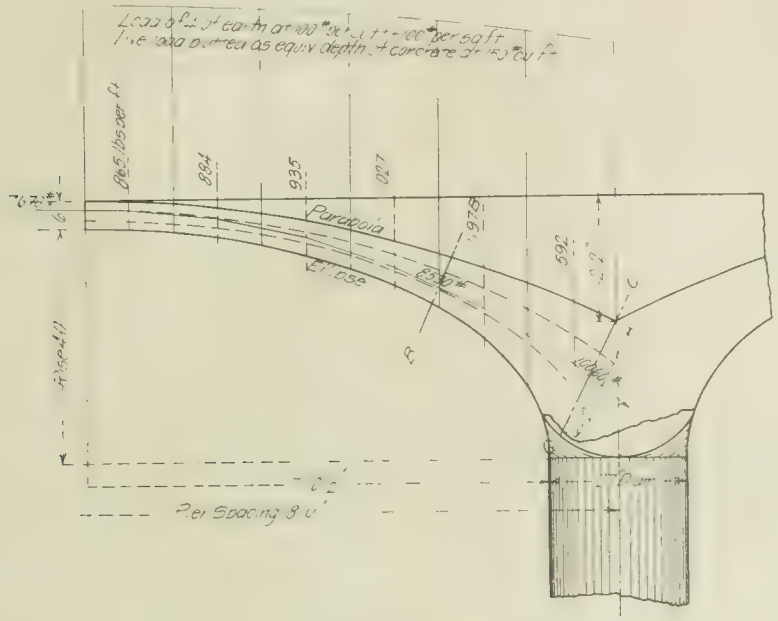

Fig. 4. Stresses in Groined Arches; Method Assuming Stresses Same as in Barrel Arches—Applied to Filtered Water Reservoir at Pittsburg, Pa.

TABLE OF STRESSES IN ARCH.

Location of Section.	Thrust per lin. ft. of arch	Area in sq. in.	Av. stress in lbs per sq. in.	Max. stress in lbs. per sq. in.
Crown	*7670	6 x12	106.5	213
HB	8530	10x12	71	142
CC	10060	25x12	33.5	

Crown thrust for whole groin unit 7670 × 18 = 138000 lbs.

EFFECT OF STEEL IN GROIN UNIT.

A natural suggestion for reinforcing a groin unit is to place a ring of steel around the unit in the manner indicated in Fig. 8. Such a device was used at Louisville (see line 4 of Table I). There are several ways of estimating quantitatively the effect of such steel.

(a) Consider that it assists the concrete in the upper part of the groin unit in carrying tension. It would then be necessary to add enough steel to bring the tension in the concrete down to a conservative unit, say 50 lbs. per sq. in. The steel could not be at the very outside fibre ($y = 1.25$, see Fig. 8) but might be say 1 ft. from the center of gravity of the concrete section. The neutral axis would be raised very much if enough steel should be added to the tension side so that the full dead and live loads might be carried with only 50 lbs. tension in the concrete. This would diminish the area of tension concrete and increase the steel needed. But assume, even, that the neutral axis does not rise: the steel would have

$$\frac{E_s}{E_c} \cdot \frac{1.}{1.25} \cdot 50 =$$

say 500 lbs. per sq. in. tension when the concrete had 50 lbs. There is approximately 3.1 sq. ft. of concrete surface above the neutral axis in the half section of fracture (see Fig. 8) and under the 500 lbs. per sq. ft. loading, Tables II and III, the tensile stress on it varies from 0 to 460 lbs. per sq. in. or roughly 230 lbs. average. To reduce this stress so as to make it vary from 0 to 50 as above assumed, or 25 lbs. average, would require, by this rough method of computing the quantity of steel, X sq. ft. as shown by the following: $144\ X \times 500 + (3.1 - x)\ 25 = 3.1 \times 230 \times 144$.

$X = 1.3$. That is, 1.3 sq. ft. of concrete on the tension side of each half section would have to be replaced by steel to bring the tension in the concrete down to 50 lbs. per sq. in. If proper account were taken of the rising of the neutral axis, the result would be considerably in excess of 1.3 sq. ft., but this result is sufficient to show the absurdity of the conception, which is treated at this length, only because it is often assumed that *somehow* by adding a little steel joint action will result between the steel and concrete in tension, and at nominal expense make a structure which will stand any abuse safely.

(b) Assume that the concrete takes no tension and that the compression on it may be as high as 600 lbs. per sq. in. *i. e.* the usual reinforced concrete beam theory. All warranted accuracy in computing the steel by these assumptions will result from estimating the "Centroid" of compressive stresses and using the lever arm between this centroid and the steel. For the full groin loading the neutral axis will drop and the centroid likewise from their positions without steel. The centroid without steel is about 1 ft. below the neutral axis and the outer fibre on the compressive side 1.4 ft. Assume 1.15 ft. as the distance of the new centroid. 1.05 ft. is the greatest practicable distance for the steel above the neutral axis. The steel hence has

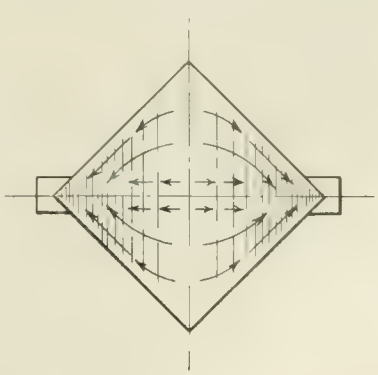

Fig. 5.

EXPLANATION.

$I_0 = \frac{1}{12} bh^3$.

g = distance from C. of G. of small section to neutral axis.

I for half section:

$I = \Sigma I_0 + \Sigma ag^2$ (All dimensions
$= .37 + 3.17 = 3.54$ in feet.)

I for whole section:

$I = 2 \times 3.54 \times 12^4$ (All dimensions in inches.)

TABLE III.—LOADS, MOMENTS, AND MAX. TENSILE STRESSES FOR LINE OF FRACTURE SHOWN.

No. of Line	Load. Description.	Load. Weight.	Assumed Lever Arm in Inches.	Moment in 1000 in-lbs.	Max. Tensile Stress due to Mom $f = \frac{My}{I}$
1	Concrete	14300	45	640	
2	Earth filling below crown at 100# per cu. ft.	4400	27	120	65
3	Earth above crown: 4′ at 100# per cu. ft. + live load = 100# per sq. ft. Total load = 500# per sq. ft.	76500	48	3680	
4	Total for 1+2+3			4440	
5	Earth filling below crown at 110# per cu. ft.	4800	27	130	460
6	Earth above crown: 3′ at 110# per cu. ft + 15# snow. Total = 345# as per table of groined arches.	52800	48	2540	340
7	Total for 1+5+6+ as per table of groined arches			3310	

a lever arm of 1.15 + 1.05 = 2.2 ft. For a moment of 4,440,000 in. lbs. the steel would have to carry

$$\frac{4{,}440{,}000}{2 \times 2.2 \times 12} = 83{,}000 \text{ lbs.}$$

and of mild steel 5 to 7 ins. would be needed. Tests have shown that lapping such steel is not successful on account apparently of the thin section of concrete splitting. Such reinforcement is hard to place satisfactorily around the corners as the extrados is depressed along the groin line so that the steel has to be kept out near the corner and hence turned sharply (See Fig. 8). This brings a heavy compressive stress on the concrete at the inside of the curve in the steel. The steel will apparently have about ⅝ as much tension at the groin lines as at the middle of the sides, or say 12,000 lbs. per sq. in. Assume a radius of 18 ins. for a bar 1½ ins. square as in the contract plans of the Pittsburg filtered water reservoir. Further, assume the stress is carried around the corner by uniform radical pressure as in cylinder under hydraulic pressure.

$1.5^2 \times 12{,}000 = 27{,}000$ lbs. in the bar.

The bearing pressure of the steel against the concrete would then be

$$\frac{27{,}000}{1.5 \times 18} = 1{,}000 \text{ lbs. per sq. in.}$$

Enough has been written, the writer thinks, to eliminate cantilever, or inverted dome action as the final reliance in carrying load. Arch action is adequate without aid from cantilever action.

Shrinkage and Temperature Changes.—But the problem is not so simple as it seems from the foregoing academic discussion of the arch theories. The disturbing elements are two: (a) Shrinkage of concrete in setting; (b) Expansion and contraction of concrete with change of temperature.

Groined arch roofs are usually laid in strips of random length and as they set, it is frequently possible to see upward between the strips. Less shrinkage takes place if sprinkling is faithfully done and the earth covering is put on early.

As for temperature, the concrete will usually be subjected, before the filters or reservoirs are put in service, to extremes from 90° to say 15° F or lower. This means a change in length of ⅝-in. in every 100 ft. or approximately ⅛-in. for every groin unit. To keep the arch action in those groins in which the concrete cannot endure a high tension in cantilever action (See Fig. 8 for magnitude of tension) it is apparently necessary for cracking to occur sufficient to move each side of the groin outward from the pier, a distance of about 1/16-in., *less* the slight movement resulting from the elasticity of the concrete when acting as a cantilever. If this cracking took place along the line of fracture assumed in Fig. 8, it would be visible at the crown on the inside but probably not elsewhere from the inside without minute examination. Such cracks are occasionally seen but no one has ever excavated on the outside so far as the writer knows to trace them for their full length. They would exist in their maximum size only in the coldest weather before the reservoir or filter was closed for service. Examinations are not usually made at such times in any unnecessary cases. After the works are in service the temperature would rarely be below 40° F and lesser cracks only would exist.

Aid Given by Earth Covering.—In all these considerations one factor has been neglected, viz., the value of the earth cover. Ordinary earth filling does not crack with reduced temperature, but more often expands due to freezing of water in the interstices. Mr. F. H. Robbins has pointed out that a very few pounds per square foot in the earth cover would transmit the crown thrusts without help from the concrete. If this action occurred the concrete would be held generally along its top surface by friction and cracks might be distributed. The earth filling the depression would in any case tend to hold the sides of the groin units away from the pier. No proved conclusion on the temperature matter can be drawn except that every groined roof that has not been admittedly maltreated in construction, by allowing the concrete to freeze or by pulling the centers prematurely, has stood successfully not only its uniform load from fill, but sundry extra loads, such as piles of construction material and heavy concentrated loads hung from the roof by rods. This throws the matter back to the initial proposition of the paper that the theory of groined roofs is incomplete, for the factor, or perhaps better, the margin of safety is undertaken.

Construction Stresses.—During the construction of groined arch roofs it is occasionally necessary to leave a strip of roof uncompleted so that a space intervenes between the completed roof and the side or end wall of the filter or reservoir. This leaves the groined arches without abutments and at once raises the question as to whether the forms may be removed and earth filling placed also. Construction foremen will tell tales of long edges exposed with the fill completely placed, but the writer has always been unable to substantiate these statements from the engineers in charge. At the Pittsburg filters, long strips of roof had to be omitted to form lanes through which the cableways could operate, but when filling was to be placed on the roof, diagonal bracing was required, strong enough to transmit the thrust to the floor. That this bracing was a wise precaution is attested by the fact that in spite of it some of the piers were lifted 1/16-in. or so from their bases on the side away from the braces and another opening took place at the top of the pier. Pictures are shown of teams or moderately heavy rollers going along close to the edge of a void the size of two or three groin units. When it is considered that such loads cover an area of perhaps 50 sq. ft. and are not even equivalent in weight to the earth which would be on that small area: further that the groin is usually

* See Items 5, 7 and 9 of Data above. † See Item C above.

entirely free from its earth load in such cases; further that friction between groins would carry the stress to the groins at the end of the void space, it would be indeed surprising if the arch did not easily endure the load.

It is recognized in construction that earth filling may be safely placed within a reasonable distance depending on the height of roof, of an incomplete edge of filter or reservoir groined roof and it is pertinent to inquire what the limits of safety are. The only resisting forces are the cantilever action in the groin units and the stability of the piers weighted with their superimposed groins. Two cases may be considered.

Case I.—Earth loading on roof terminated

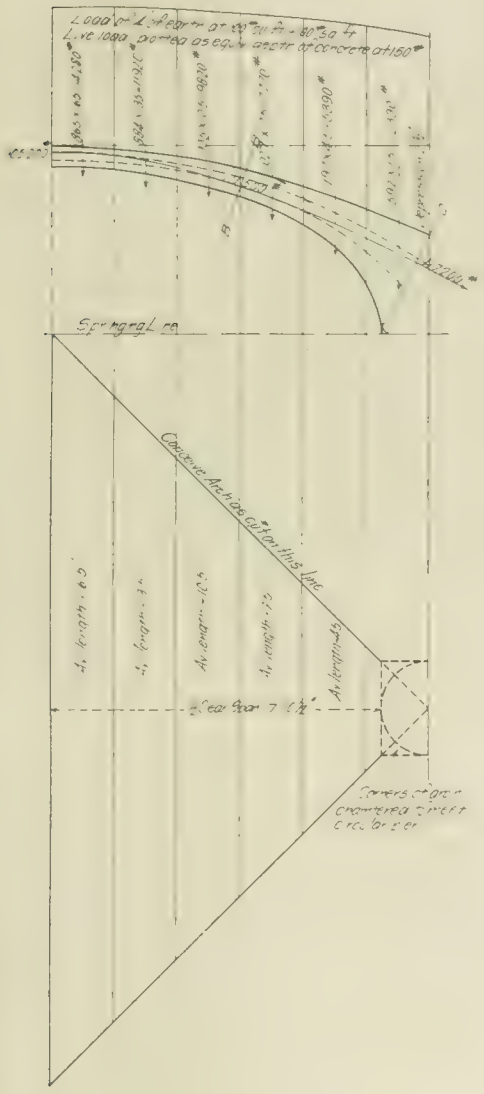

Fig. 6.—Stresses in Groined Arches; Method Assuming Arch Cut on Groin Lines.—Applied to Filtered Water Reservoir at Pittsburg, Pa.

TABLE OF STRESSES IN ARCH.

Sec. loc.	Thrust lbs.	Area sq. ins.	Av stress lbs. sq. ins.	Max stress lbs. sq. ins.
Crown	105,200	216"x6"	81.5	163
BB	111,700	108"x7.75"	133.5	267
CC	117,200	27"x25"	174	348

abruptly:

Let n = number of empty groins with piers that are necessary to resist the thrust from the loaded portion of roof.

Then for the filtered water reservoir at Pittsburg (see Table I).

Weight of one pier $= 3.98 \times 21.5 \times 150 = 12{,}800$ lbs.

Lever arm of pier $\frac{2.25}{2}$ — 17 ins. = .95 ft.

Weight of groin unit =

$$\frac{8.2}{12} \times 18^2 \times 150 = 33{,}200 \text{ ft.}$$

Lever arm of groin unit = 2.25 — .33 = 1.92 ft.

(This assumes that there is enough friction and continuity in the roof at the crown points to keep it in its original plane and not permit tipping. Otherwise the lever arm would be only half as great. Observations bear out the assumptions.)

(a) Assume thrust as in Fig. 6 = 105,200 lbs.; lever arm = 21.5 ft.

Then n (12,800 × .95 + 33,200 × 1.92) = 105,200 × 21.5; 75,900 n = 2,260,000.

n = 30. That is, it would take 30 groin units and piers, or 540 ft. of unloaded reservoir roof, to resist the overturn due to a full load on the adjacent roof. Whatever strength other groin units have as cantilevers, including any effect of continuity of several units, would constitute the only margin of safety. If it were not desired to risk the groins supporting their own weight as cantilevers, it would be necessary to leave the forms under the roof for a sufficient distance from the edge so that the stability of the supported groins would take the thrust from an unsupported unloaded groin. It is customary to thus leave forms in place. The number required to be supported by forms will appear from Case II below. It should be noted that any part of the weight of roof that is carried on wooden posts supporting forms is not available to resist overturn. The weights of forms coming on piers may be assumed to offset this deduction.

Case II.—Assume earth loading to be tapered off toward the edge. This will permit full loading nearer the edge than in Case I since the partial earth loading increases the stability. Even a reasonable estimate under the assumptions requires considerable detailed computation.

Data: (See Case I for certain results below listed):

1. Weight of one pier, 11,400 lbs.
2. Assumed lever arm of pier, .95 ft.
3. Weight of one groin unit, 33,200 lbs.
4. Assumed lever arm of groined units (also of any loading or groin unit), 1.92 ft.
5. Resistance to overturn of one pier and groin unit, 76,000 ft. lbs.
6. Weight of filling in hollow of groin, 4.34 yds. at 2,700, 11,700 lbs.
7. Resistance to overturn afforded by filling of hollow in groin unit = 11,700 × 1.92 = 22,500 ft. lbs.
8. Weight of one foot of filling at 100 lbs. or of 100 lbs. per sq. ft. live load 18 × 18 × 100 = 32,400 lbs.
9. Resistance to overturn afforded by one foot filling equals 32,400 × 1.92 = 62,000 lbs.
10. Load on one groin unit due to 4 ft. of filling and 100 lbs. sq. ft. live load = 500 × 18 × 18 = 162,000 lbs.

1 to 3 Incl.	Each 51	153	104 153 − 104 = 49 + $\frac{49}{112}$ = .44′ fill above crown.
4	Own weight 51 Fill in hollow 14 .44×48 = 21 86	239	239 − 104 = 135 + $\frac{135}{112}$ = 1.20′ " " "
5	51+14 = 65 1.2×48 = 58 123	362	362 − 104 = 258 + $\frac{258}{112}$ = 2.30′ " " "
6	65 2.3×48 = 110 175	537	537 − 104 = 433 + $\frac{433}{112}$ = 3.9′ " " "

Result indicates that full depth of filling could be placed on the 7th row of groin units from edge; i. e., about 90 ft. from edge.

* See Items 5, 7 & 9 of "Data" above. † See Item (C_3) above.

Thrust with 500 lbs. sq. ft. load (See Fig. 6) = 105,200 lbs.

Assumptions.—The thrust of 105,200 lbs. is due to the dead load, earth load and live load roughly in proportion to weight of each load but is more closely proportioned on the assumption that it is due to

(a) 8/10 of dead weight of groin unit; (b) ½ of filling in hollow of groin unit; (c) the whole of filling and live load above plane through extrados of crown.

The use of 8/10 and ½ the loads in (a) and (b) is due to the fact that a part of weight of groin unit and filling in hollow is concentrated near pier.

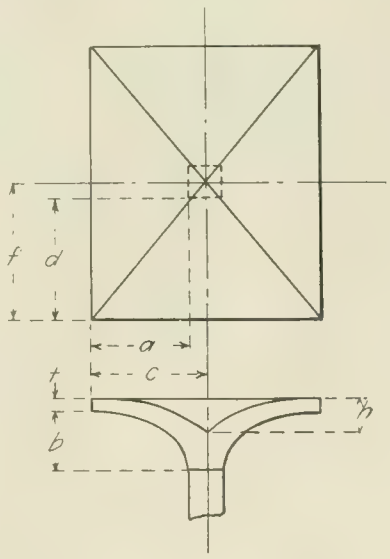

Fig. 7.

(a_1) 8/10 × 33,200 = ... 26,600
(b_3) ½ × 11,700 = ... 6,000

aPier foundation 6'x6'x12" thick, reinforced with 16-¾" sq. steel bars. (Total weight = 126#) Rest of floor 5" thick, except for 4"x12" water stops under diagonal joints.
‡Design for Rock—Rock now known not to exist.
=Bottom of floor under pier is 6" higher than bottom under invert, thus saving a pyramid of excavation and concrete 22'x 22'x 6", or an average of 2" over whole area. Excava. somewhat complicated. Done to improve drainage of excava. under piers.
xTwo layers of concrete instead of one layer of concrete and puddle. Feb., 1910.

Overturning moment assumed due to weight of groin unit.

(b₁) 3,200 × 21.5 = ... 69,000 ft. lbs.

Overturning moment assumed due to filling in hollow.

(c₁) 17,500 × 21.5 = ... 375,000 ft. lbs.

Overturning moment assumed due to 100 lbs. sq. ft.

(d) 105,200 × 21.5 = ...2,250,000 ft. lbs.

Overturning moment assumed due to total load.

The computation in the table results in permitting the assumed fill loading over the 18th pier from the edge. The table shows also that a filling of 3 ft. such as was actually used could be permitted over the 15th or 16th pier. Such relatively elaborate computations and applications of them have not been made in practice so far as the writer knows. Reservoirs of such large area exist at only a few places and the *filter* roofs are more stable by reason of lower and broader-based piers. Dividing walls also introduce stability about every 100 or 200 ft. This is so important a point in construction that a similar determination is given below for the Pittsburg filters to illustrate the more common problem. The thrust taken in connection with Fig. 9, will be applicable to Case I also.

Data For Case I and II (see also Table I, line 39):

1. Weight of one pier, 35.3 cu. ft. at 150 = 5,300 lbs.

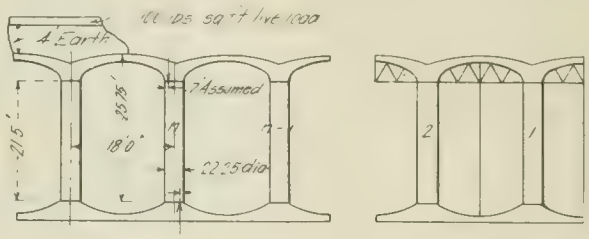

Fig. 9.

2. Lever arm of pier (assumed) = 1.33 ft.
3. Weight of one groin unit 15 × 15 × 7.3 ÷ 12 at 150 = 20,500 lbs.
4. Assumed lever arm of groin unit (also of any loading on unit) = 2.17 ft.
5. Resistance to overturning of pier = [illegible] of filling = 22,500 × 2.17 = 48,000 ft. lbs.
7. Resistance to overturning, afforded by filling in hollow = 6,560 × 2.17 = 13,000 ft. lbs.
8. Weight of 1 ft. of filling on a groin unit at 100 lbs. = 22,500 lbs.
9. Resistance to overturn afforded by 1 ft. of filling = 22,500 × 2.17 = 48,000 ft. lbs.
10. Weight of 3 ft. of filling on one groin unit = 67,500 lbs.

Assumptions (as before).

(a₁) .85 × 20,500 = ...17,600
(b₁) ½ × 6,560 = ... 3,300
(c₁) 1 × 67,500 = ... 67,500

Overturning moment due to 100 sq. ft.

(d₃) 50,000 × 8.75 = ...438,000 ft. lbs.

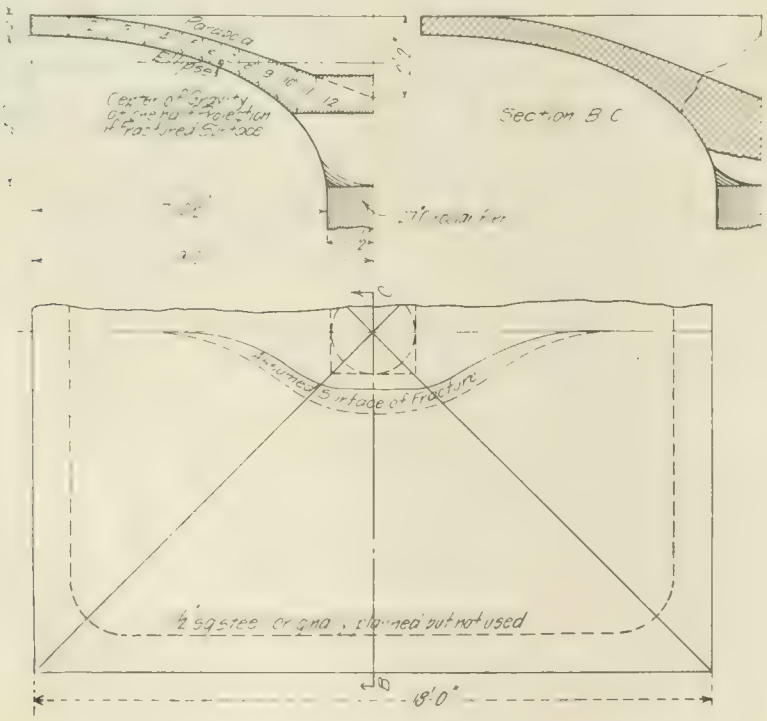
Overturning moment due to total load.

Case I—Loading terminated abruptly as in Fig. 9.

51,000 *n* (See Item 5 of "Data" above) = 500,000 (See Item d₃ of "Assumptions above).

n = 12 that is, full loading could be placed on arch 180 ft. from edge.

Most of the piers of filters 1 to 46 at Pittsburg were concreted monolithic with the roof and hence offered further resistance, (as long as the roof acted continuously) to the extent that their strength as cantilever beams permitted. At 50 lbs. per sq. in. in allowable tension, each pier would add resistance, *R*, computable as follows:



Parabola
Ellipse
Center of Gravity of Figure of Rotation if Fractured Surface
Section B C
Assumed Surface of Fracture
½ Section of area planned but not used
18'0"

Fig. 8.

is 50,000 lbs. per groin unit on the assumption of an arch triangular in plan as in Fig. 7.

There are two cases to be considered as before. The figure is drawn for case II, but,

groin unit = (5,300×1.33) + (20,500×2.17) = 51,000 ft. lbs.

6. Weight of filling in hollow of groin, 2.43 yds. at 2,700 = 6,500 lbs.

$R \times$ height of springing line $= 1.6 \cdot 50 \times 22 \times 22 \times 22.$

$$R = \frac{88{,}700}{8.75} = 10{,}000 \text{ lbs}$$

This is a considerable and in resisting a thrust of 10,000 lbs. A few piers cracked horizontally at springing.

The various computations above given show the most favorable conditions possible in that they assume continuity of the roof to the extent necessary to bring the roof load on the edge of the pier instead of the center, at the same time bringing the application of the horizontal thrust to the top of the pier instead of the crown of the arch. For winter conditions such assumptions would not be conservative for reasons that will be evident from the early part of the paper.

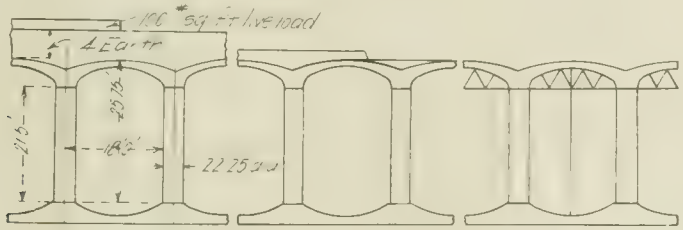


Fig. 10.

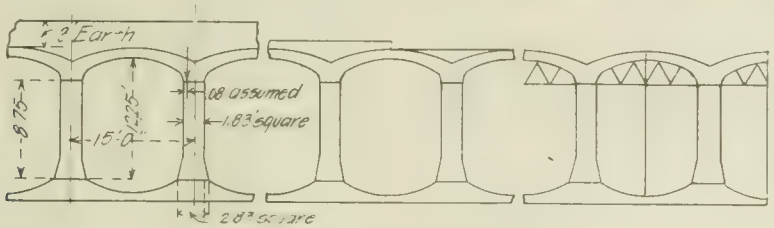

Fig. 11.

as that of the filtered water reservoir at Pittsburg, would be difficult to shore but the filters are much less so. The most convenient place to shore is opposite each pier, placing the upper end of the brace on the intrados, just above the pier, perpendicular to the thrust, and footing the brace at the base for the next pier. A depression could easily be made for such a brace. Such braces for the Pittsburg filters are about 17 ft. long and the horizontal projection of their length is about 14 ft., making the load $\frac{17}{14} \times 50{,}000 = 60{,}700$ lbs.

An 8 × 10-in. stick of reasonably good timber, with proper bearings at each end is adequate but blocking at either end with bearing across grain would permit movement and cause cracks to open at the springing line and at the base of the piers. Bracing is certainly more reassuring than a margin of unloaded groins, particularly for work that must stand over winter.

Floors of Filters and Reservoirs.—The common form of floors and methods of computing their volumes was described above. A tabulation of the floors of the various filters and reservoirs would be quite as pertinent and interesting as that for roofs given by Table I. The writer has had time to compile only a few important cases as shown by Table VI.

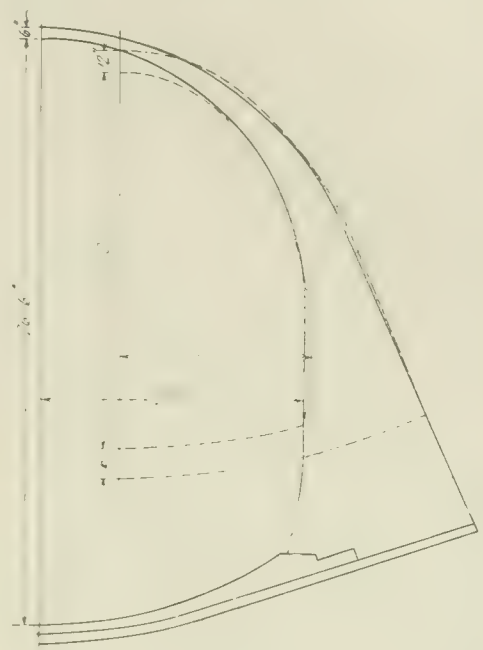

Fig. 12.—Side Wall of Pittsburg Filtered Water Reservoir Compared with Half Section of Catskill Aqueduct.

Fig. 13.—Approximate Design for Reinforced Concrete Beam and Slab Construction to Carry Load of 500 lbs. per sq. ft. in Addition to Dead Load.

Notes.—Assumptions used in design: $f_c = 600$, $f_s = 15000$, $R = 15$, per cent of steel $= 0.67$, $K = 91$ in formula $M = Kbd^2$, M at center of span 1-12 wl^2, over supports 1-12 wl^2.

Approximate quantities: Concrete = .81 cu. ft. per sq. ft. (average), steel 6.78 lbs. per sq. ft. (average).

Reference was made above to bracing unfinished edges of groined roofs where it is desired to fill up to the edge. High roofs, such

The groined arch floor has been as generally satisfactory as the groined arch roof. Groined arch floors are very easily screeded in dia-

mond-shaped pieces joining under piers along groin lines and along invert lines. The loads on the earth are comparatively light and the thicknesses, which have been merely guesses so far as the writer knows, have proved adequate. The Pittsburg filters and reservoirs are mostly on very porous ground and the lower layer of concrete was used in the 1904 design in place of puddle. A standard floor with minimum thickness 6 ins. as in most other plants, and puddle, was the alternative design not used. The 1908 Pittsburg filters contain an innovation in the use of a single flat floor lapping onto reinforced pedestal blocks under piers. The economy in material is evident from Table IV.

Side Walls and Division Walls.—Side walls of filters and reservoirs exhibit the same boldness of design as do the groined arch roofs. They are generally of the so-called aqueduct section but thinner, particularly at and near the crown, than aqueducts are made. This has an added significance because the side wall is generally concreted separately from the adjacent roof, so as to leave a joint along the crown, whereas the aqueduct is monolithic; and further the side wall has no opposing wall of the same shape and loading to keep a uniform condition, but instead has against it a long stretch of groined roof with varying temperature conditions. Figure 12 shows a section of the side wall of the filtered water reservoir at Pittsburg with a half section of the Catskill aqueduct superimposed. At the Washington filtration plant side walls are made like ordinary retaining walls in some cases and the groined arch carried out to them. Ths gives the same head room near the side walls as near piers or division walls. Dependence must be placed on immobility of filling behind such walls and this dependence appears not to have been misplaced—another example of successful boldness.

Division walls between filters are usually made of the same section as piers, and the floors beneath them are of the same section as the floors beneath piers, though they are sometimes thickened a little.

Comparison of Groined Arch Roof with Reinforced Concrete Slab and Beam Construction; Pittsburg Filtered Water Reservoir Used as Basis.—Figure 13 shows a design for reinforced floor to carry the same load as that assumed for the groin arch of the Pittsburg reservoir, viz., 400 lbs. of earth and 100 lbs. per sq. ft. live load. The units used for the reinforced concrete are as follows:

Compression in concrete, 600 lbs. per sq. in.
Tension in steel (mild), 16,000 lbs. per sq. in.
Ratio of moduli of elasticity, 15.
Straight line variation in compression of concrete moment which beam will carry $94bd^2$.
Per cent of steel, 0.67.

Beams and slabs designed for moment of $\frac{wl^2}{12}$ both at center and over supports. Any larger moments due to partial loading assumed to be cared for by increased stresses, since the final conditions are so uniform.

Figure 11 shows a roughly worked out design for the purpose of comparing costs. No shear computations have been made but rods are bent up "by eye." The design differs from much of the commercial practice in that the compression in the lower parts of the beams at supports where no slab exists has been provided for by deepening the beams instead of by assuming stronger concrete at these inconvenient points. The downward slope of the bottom of the girders toward their supports is perhaps too abrupt. The girders at supports are not quite deep enough to fulfill the formula $94\ bd^2$, but there is an excess of steel due to shearing provisions. The slab steel has not been worked out but the quantity is assumed to be $\frac{1}{3.4}$ of the quantity obtained by taking 0.67 per cent of the volume from the top to the center of steel at the bottom.

From Fig. 11 the average thickness of concrete in the reinforced construction is 9.7 ins., against 8.22 ins. for the groined arch roof of the Pittsburg reservoir; and the steel and other differences are still to be added. A comparison in more detail is as follows:

Groined arch roof:

$\frac{8.22}{12}$ cu. ft. of concrete at $6 per yard (22 cts. per foot)	$ .15
Charge for forms for each square foot	.10
Total relative cost per square foot	$ .25

Reinforced concrete roof:

8 cu. ft. of concrete at $6.90 per cu. yd. (25.5 cts. per cu. ft.)	$ .207
678 lbs. of steel at 2.75 cts.	.187
Charge for forms for each sq. ft. of roof, say	.15
Total	$ .54

The difference in price of concrete is made up of 40 cts., due to using 1:2:4 for the reinforced concrete instead of 1:3:5 as for the groined arch concrete, and 50 cts. assumed extra cost of rehandling or otherwise carefully placing the concrete around the steel. All assumed prices are intended to be so chosen as to favor the reinforced construction, if either. The reinforced construction might be credited with the filling in the hollow of the vaulting not necessary with the flat roof. This would amount to $\frac{4.34}{324} = .013$ yd. of earth filling per square foot, but this would cost less than ½ ct. In this comparison it is assumed that the high water line could be at the same distance below the flat roof as below the arched roof, and that air pockets formed above high water by the beams are unobjectionable.

It may be objected that it is not fair to compare a reinforced concrete structure capable of bearing, with a certain factor of safety nearly, on the elastic limit, a load per square foot of 400 lbs. of filling and 100 lbs. live, with a structure that, whatever it is thought capable of, is carrying only perhaps 315 lbs. per sq. ft. in addition to its own weight and doing this with an unknown margin of safety. A sufficiently close correction to the quantities in the reinforced construction resulting from reducing the load to 315 lbs. can be arrived at by assuming that the "effective" concrete and all the steel varies as the square root of the total load, thus:

Loads as used in design—

Dead load, lbs. per sq. ft.	120
Live load, lbs. per sq. ft.	500
	620

Revised loads—

Dead load, lbs. per sq. ft., say	105
Live load, lbs. per sq. ft.	315
	420

Effective concrete, say 8/10 of total.

Then revised effective concrete $= \sqrt{\frac{420}{620}} \times \frac{8}{10} \times .81 = .53$ cu. ft. per sq. ft.

Total revised effective concrete $= .53 \times \frac{7}{5} \times .81 = .60$ cu ft. per sq. ft.

Revised steel quantity $= \sqrt{\frac{420}{620}} \times 6.78 =$ 5.6 lbs. per sq. ft.

Revised relative cost $= .60 \times 25.5\text{c} + 5.6 \times 2.75 +$ say $.14 = 45\text{c}$ per sq. ft.

Again it may be said that it is not necessary to space the piers so far apart. The cost of the effective concrete and the steel would be reduced approximately in direct ratio of the revised to the original span. But the spacing computed by reducing the span would be more apparent than real, since the high piers are already about as spindling as desirable and the cost of forms per square foot of roof would probably increase with the greater number of units to be erected to produce the given area of roof. One who has watched the extremely rapid work of placing the groined roof by cableway (an average of 200 cu. yds. per day has been placed with one cableway during several months) would probably never feel moved to substitute, at least on a large plant, the complicated reinforced construction, even if the factor of safety of the groined arch is a little obscure. The New Haven filter plant is an example of the use of reinforced concrete for a small plant.

In conclusion the writer wishes to make acknowledgement to Mr. Morris Knowles, chief engineer of the Bureau of Filtration, Pittsburg, Pa., for permission to use the Pittsburg work as a text.

Report of Inspection on Deterioration of Tunnel Linings, Northern Pacific R. R.*

I made a careful inspection of the Bozeman tunnel, which tunnel is operated on a 2 per cent grade approaching thereto, such that while the grade is lighter in the tunnel, approaching same they have the 2 per cent grade to overcome and receive the effects of the engine when operating under this grade. This tunnel was lined in 1895-6 and is 3,650 ft. long. Approximately 300 ft. of the roof being lined with brick and the remainder with concrete, the sidewalls are constructed of concrete throughout. Proportions of concrete are 1, 3 and 5, and English Portland cement was used. In the 300 ft. of brick lining probably 50 brick have been disintegrated and removed entirely, probably due to joint action of frost, gas and blast of engines. The concrete lining in this tunnel as a whole was in good repair. At the ends of the sections of the roof I found disintegrated roofing from ½ to 2 in. or more in several places; I also found several places where the concrete had become removed, from the size of a chestnut to as large as a man's fist; also found in one place where they had more particular trouble with water during the work, the roof had sloughed off for a length of 20 ft. from three to six inches, the remaining portion of the concrete was as good today as when put in in the year 1896, from which I would conclude that the defective roof in the concrete portion was due to improper mixing of the concrete, same not being wet enough or that forms were removed too soon and allowed the blast to affect same before it was properly set up, or possibly the result was a joint action of the blast and improper mixing of the concrete.

We next visited the Mullen tunnel, which is approximately 3,900 ft. long and is located on the summit of the Rocky Mountains west of Helena on a 2 per cent grade. This tunnel was lined in 1892-3-4, the sidewalls are of concrete and the roof is lined with brick with the exception of the portals, which are lined with concrete. Proportions of concrete are 1, 3 and 5, and English Portland cement was used. The portals of this tunnel are in first-class condition and show no effects of weather, frost, gas or blast of locomotives. The brick lining has disintegrated. The bricks were not vitrified bricks, and as explained by Mr. F. J. Taylor, Division Engineer, who accompanied me on the inspection of this tunnel and who was in charge of the work when same was lined, the disintegration of the brick was largely due to frost action as much as to the effects of blast of locomotives or the gases from locomotives.

We next visited the Iron Ridge tunnel, which is located some five miles east of Mullen tunnel on the Helena Mountain, said tunnel being on a reverse curve 600 ft. long on a 2.2 per cent grade, and was lined in 1898 with concrete throughout, Atlas cement, proportions 1, 3 and 5. This tunnel showed up in splendid condition and there was practically no sign of disintegration throughout length of tunnel.

We next visited the Big Horn tunnel, which is located some 60 miles east of Billings, is 1,000 ft. long on a .5 per cent grade westbound and was lined in 1898 with concrete throughout, Atlas cement, proportions 1, 3 and 5. Travel on this portion of the line is not as heavy as at the other three tunnels inspected. The roof of this tunnel was in excellent condition. We discussed the repairs of the tunnels with the Supervisors who have had charge of same.

*Extract from report of Committee on Roadway, American Railway Engineering and Maintenance of Way Association.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

First Cost of Plant and Cost of Generating and Distributing Electricity for Lighting, Edison Electric Illuminating Co. of Brooklyn.

This company was incorporated in 1887. In 1907 it had a 23,650 K. W. plant, and produced 71,769,800 K. W. hrs. at the switchboard.

The following is an itemized statement of the plant and its rated capacity, as of June 30, 1907:

Station Equipment:	Total.
40 boilers, water tube	23,400 HP.
8 superheaters	6,000 HP.
5 steam engines, direct connected	14,750 HP.
2 turbo-units, D. C.	11,250 KW.
5 generators, direct. con., A.C.	12,400 KW.
1 booster	50 KW.
2 exciters, motor driven	250 KW.
2 exciters, steam driven	1,000 KW.
222 storage battery cells	5,120 amp. hrs.
1 rotary	1,000 KW.
3 transformers for rotaries	1,200 KW.
Substation Equipment:	
63 rotary converters, etc.	29,600 KW.
156 transformers	43,500 KW.
1,200 storage battery cells	18,875 amp. hrs.
7 balancers	450 KW.
13 boosters	650 KW.
31 motor generators	8,045 KW.

The company had 16,011 meters, and owned the following lamps:

Arc A-C, enclosed	577
Arc D-C, open	1,174
Arc D-C, enclosed	6,352
Nernst	2,711

It owned 3,039,132 duct feet of conduits, but rented much of its conduit space. There were 499 manholes on its subways. Exactly what other lines it owned June 30, 1907, is not reported, but on Dec. 31, 1907, the company reported the following circuits, divided into direct current and alternating current:

Overhead.	Direct.	Alternating.
Poles	1,218	10,931
Feet of street	299,638	576,280
Feet of circuit	918,348	513,892
Feet of wire	1,875,240	1,531,694
Million mil. ft. of wire	81,125	86,443
Underground:		
Feet of ducts occupied	1,698,877	656,300
Feet of street	689,382	99,528
Feet of circuit	1,495,057	810,354
Feet of wire	4,473,000	2,443,462
Million mil. ft. of wire	1,558,042	472,781

The cost of this plant is reported as follows:

1.	Generating station bldgs. and land	$ 674,666
2.	Substation bldgs. and land	650,559
3.	Other real estate	48,007
4.	Steam plant, generating station	1,051,796
5.	Electrical plant, generation station	965,824
6.	Substation apparatus	507,965
7.	Transmission lines, underground conductors, construction, poles and lines	4,136,009
8.	Construction, subways	239,950
9.	Services	973,558
10.	Line transformers	150,184
11.	Meters	301,677
12.	Arc lamps	242,607
13.	Tools and implements	20,955
14.	Office furniture and fixtures	50,131
15.	Appliances installed, miscel.	64,874
16.	Storage batteries	182,150
17.	Sundries, automobiles, etc.	74,526
	Total	$10,326,437

In addition to this another item of $3,618,245 is reported, called "Organization, merged companies, plants and franchises, etc., merger account." This item clearly represents little or no money expended for plant or land, as will be made more evident from the following analysis of the cost per K. W., ascertained by dividing each of the above 17 items by 23,650,—which is the rated K. W. capacity:

		Cost per KW.
1.	Generating sta. bldgs. and land	$ 29
2.	Substation bldgs. and land	28
3.	Other real estate	2
4.	Steam plant	44
5.	Electrical generating plant	41
6.	Substation apparatus	21
7.	Transmission lines	175
8.	Construction, subways (in part)	10
9.	Services	41
10.	Line transformers	6
11.	Meters	13
12.	Arc lamps	10
13.	Tools and implements	1
14.	Office furniture, etc.	2
15.	Miscel. appliances	3
16.	Storage batteries	8
17.	Sundries	3
	Total	$437

Items 7 and 8 should be merged, for Item 8 is clearly too small to include the entire cost of the conduits, since it amounts to only 8 cts. per duct foot. Mayer's "Telephone Construction, Methods and Cost" gives detailed costs of conduits in several cities, and the lowest is several times this amount.

During the fiscal year of 1907, the plant produced 71,769,804 K. W. hrs., at the switchboard, of which 47,613,138 K. W. hrs. were sold and 800,783 K. W. hrs. were used for station purposes. This leaves 32.5 per cent unaccounted for—lost in transmission, etc.

The operating expenses were as follows:

	Production Expense:	
1.	Salaries	$ 22,510
2.	Labor	136,116
3.	Fuel	285,654
4.	Oil, waste and sundries	17,355
5.	Water	28,449
6.	Repairs, buildings and structures	2,493
7.	Repairs, motive power	39,622
8.	Repairs, electric apparatus	2,296
9.	Station expense	2,330
10.	Purchased power (electric)	28,575
	Total production expense	$ 565,400
	Distribution Expense:	
11.	Salaries	$ 7,687
12.	Substation, labor and expense	98,607
13.	Rental of subways, etc.	117,162
14.	Incandescent lamp renewals	110,199
15.	Repairs, poles and lines	22,918
16.	Repairs, subways and cables	30,957
17.	Repairs, meters	4,872
18.	Repairs, transformers	187
19.	Repairs and expense, commercial arc lamps	89,711
	Total distribution expense	$ 482,300
	General Expense:	
20.	Salaries of officers	$ 18,850
21.	Salaries of office men	67,665
22.	Collecting and reading meters	19,797
23.	Legal expenses	19,009
24.	General expense	73,256
25.	Advertising	44,364
26.	Canvassing new business	82,917
27.	Insurance	47,884
28.	Miscellaneous	58,178
	Total general expense	$ 431,920
	Taxes and Rents:	
29.	Taxes, general	$ 86,916
30.	State franchise tax	61,584
31.	Lease halls, rentals, etc.	4,783
	Total taxes and rents	$ 153,283
	Grand total	$1,632,903

Dividing each of the above 31 items by the 71,769,804 K. W. hrs. produced, we have the following costs per K. W. hr. produced:

		Cts. per KW. hr.
	Production Expense:	
1.	Salaries	0.031
2.	Labor	0.190
3.	Fuel	0.400
4.	Oil, waste, etc.	0.024
5.	Water	0.039
6.	Repairs, bldgs.	0.003
7.	Repairs, motive power	0.056
8.	Repairs, electric appar.	0.003
9.	Station expense	0.003
10.	Purchased power (electric)	0.039
	Total production expense	0.788
	Distribution Expense:	
11.	Salaries	0.011
12.	Substation, labor and expense	0.138
13.	Rental of subways, etc.	0.163
14.	Incandescent lamp renewals	0.153
15.	Repairs, poles and lines	0.032
16.	Repairs, subways and cables	0.043
17.	Repairs, meters	0.007
18.	Repairs, transformers	
19.	Repairs and expense commercial arc lamps	0.125
	Total distribution expense	0.672
	General Expense:	
20.	Salaries of officers	0.029
21.	Salaries of office men	0.094
22.	Collecting and reading meters	0.028
23.	Legal expense	0.027
24.	General expense	0.101
25.	Advertising	0.061
26.	Canvassing new business	0.115
27.	Insurance	0.067
28.	Miscellaneous	0.080
	Total general expense	0.602
	Taxes and Rents:	
29.	Taxes, general	0.121
30.	State franchise tax	0.085
31.	Lease halls, rentals, etc.	0.007
	Total taxes and rents	0.213
	Grand total	2.275

This cost of 2.275 cts. per K. W. hr. is the cost per "K. W. hr. produced." To arrive at the cost per "K. W. hr. sold," divide each item by 67.5 per cent, for it must be remembered that transmission losses, etc., amounted to 32.5 per cent. Summarizing, we have the following unit costs:

	Cts. per KW. hr. Sold.	Produced.
Production expense	1.168	0.788
Distribution expense	0.995	0.672
General expense	0.892	0.602
Taxes and rents	0.315	0.213
Total operating expense	3.370	2.275

The question now arises whether the maintenance expenses for this year were normal or not. In all cases of this kind it is desirable to express the repairs and renewals costs in terms of K. W. of plant capacity. Therefore, if we divided the total annual costs of repairs (Items 6, 7, 8, 15, 16, 17 and 18) by 23,650 (the number of K. W. capacity), we have the following repair costs:

		Per KW.
6.	Repairs, buildings and structures	$0.10
7.	Repairs, motive power	1.67
8.	Repairs, electrical apparatus	0.10
15.	Repairs, poles and lines	0.97
16.	Repairs, subways and cables	1.31
17.	Repairs, meters	0.20
18.	Repairs, transformers	0.01
	Total	$4.36
14.	Renewals of incandescent lamps	$4.65
19.	Renewals and expense of arc lamps	$3.79
	Grand total	$12.80

The last two items partake more of the nature of providing supplies than of repairs, so that the true plant repairs are embraced in the other items, amounting to $4.36 per K. W. We have seen that the plant represents an investment of $437 per K. W., hence the current repairs were only about 1 per cent of the first cost. Even the steam plant, which cost $44 per K. W., had repairs of only $1.67 per K. W., or less than 4 per cent.

It is clear that to this actual cost of $4.36 per K. W. for repairs, there should be added a very considerable sum to provide for normal annual repairs over a long term of years, as well as for amartization. Exactly what percentage of the first cost should be allowed is difficult to determine. A study of the items of first cost of this plant would indicate that about 4 per cent of its first cost ($437 per K. W.) would provide for amartization and additional repairs sufficient to maintain a normal condition, or about $17.50 per K. W. Now each K. W. produced 3,032 K. W. hrs. at the switchboard; hence $17.50 ÷ 3,032 = 0.577 ct. per K. W. hr., which should be added to provide for depreciation and additional repairs for normal conditions. In like manner an interest charge of 6 per cent on the first cost gives us another 0.865 ct. per K. W. hr. produced. Summarizing, we have:

	Cts. per KW. hr. Sold.	Produced.
Total Operating Expense	3.370	2.275
Depreciation, etc.	0.855	0.577
Interest, at 6 per cent	1.273	0.865
Grand total	5.498	3.717

The average price at which current was sold was 6.6 cts. per K. W. hr., which indicates a net profit of fully 1.1 cts. per K. W. hr., for it is possible that our allowance for depreciation, etc., is too high. During the last half of 1907, the average income was 6.75 cts. per K. W. hr. Some current was sold to other electric companies and to street car companies for as low as 1.75 cts. per K. W. hr.

The amount of fuel used during the fiscal

year ending June 30, 1907, is not reported; but, during the last half of 1907, there were used 1.30 lbs. of coal per K. W. hr. generated, of which 85 per cent was anthracite and 15 per cent bituminous. The average price of the fuel was $1.60 per ton of 2,000 lbs. This very low price indicates a low grade of coal.

Among the Distribution Expenses is Item 13, which consists principally of the rental of conduits. It is not stated what the rate of rental was, but it was under $1,000 per duct mile per year, that being the rate paid by the New York Edison Co.

The employees and their total annual wages were as follows:

1	accountant, general	$ 1,898
1	[illegible]	224
10	[illegible]	6,564
[illegible]	[illegible]	1,296

BRIDGES AND BUILDINGS.

Materials and Supplies.

Structural Shapes.—The following are the current prices for structural shapes f. o. b. Pittsburg:

I-beams and channels, 3 to 15 in., 1.50 to 1.55 cts. net.
I-beams over 15 in., 1.65 cts. net.
H-beams over 8 in., 1.75 cts.
Angles, 3 to 6 in., 1.60 cts.
Angles, over 6 in., 1.65 cts.
Tees, 3 in. and up, 1.65 cts.
Zees, 3 in. and up, 1.60 cts. net.
Angles, channels and tees under 3 in., 1.50 cts., base, plus 10 cts.
Deck beams and bulb angles, 1.80 cts. net.
Hand rail tees, 2.80 cts. net.
Checkered and corrugated plates, 2.80 cts. net.

Prices at Chicago for shipment from stock are as follows:

Angles, 3 to 6 in.	2.00
Angles over 6 in.	2.10
Beams and channels	2.10
Beams over 15 in.	2.10

The New York quotations for structural shapes are as follows:

Beams and channels, 3 to 15 in.	1.66@1.71
Zees, 3 in. and up	1.66@
Angles, 3x3 up to 6x6	1.66@1.71
Tees	1.81@
Steel bars, full extras	1.71@1.76

Plates.—The current prices for plates f. o. b. Pittsburg on the basis of net cash in 30 days are as follows:

Tank plates, ¾ in. thick, 6½ in. up to 100 in. wide, 1.55 cts. to 1.60 cts. base.
Gages under ¼ in. to and including 3/16 in. 1.80 to
Gages under 3/16 in. to and including No. 8, .15
Gages under No. 8 to and including No. 9, .25
Gages under No. 9 to and including No. 10, .30
Gages under No. 10 to and including No. 12, .40
Sketches, 3 ft. and over in length, .10
Complete circles, 3 ft. diameter and over, .20
Boiler and flange steel, .10
A. B. M. A. and ordinary fire box steel, .20
Still bottom steel, .30
Marine steel, .40
Locomotive fire box steel, .50
Plates in widths over 100 in. to 110 in., .05
Plates in widths over 110 in. to 115 in., .10
Plates in widths over 115 in. to 120 in., .15
Plates in widths over 120 in. to 125 in., .25
Plates in widths over 125 in. to 130 in., .50
In widths over 130 in., 1.00

Prices at Chicago for shipment from stock are as follows:

¼ in. and heavier, up to 72 in.	2.00
Over 72 in.	2.10
3/16 in. thick	2.50
No. 8	2.15

The following are the New York quotations on plates the prices being based on carload lots, with 5 cts. extra for less than carload lots. Terms, net cash, in 30 days.

Tank plates, ¾ in. thick, 6½ to 100 in. wide	1.71@ 1.76
Flange and boiler steel	1.81@ 1.86
Marine	2.11@ 2.16
Locomotive and fire box	2.21@ 2.26
Still bottom	2.01@ 2.06

Plates more than 100 in. in width, 5 cts. extra per 100 lbs.; plates, 3/16 in. in thickness, 10 cts. extra; gage Nos. 7 and 8, 15 cts. extra; No. 9, 25 cts. extra.

Sheets.—The current minimum prices for mill shipments from Pittsburg on sheets in car load and larger lots are as follows:

Galvanized roofing sheets No. 28, 2½ in. corrugations, $3.00 per square
Painted roofing sheets, No. 28 1.70 per square

Galvanized Sheets.

Nos. 13 and 14	2.50 cts.
Nos. 15 and 16	2.60 cts.
Nos. 17 to 21	2.75 cts.
Nos. 22 to 24	2.90 cts.
Nos. 25 and 26	3.10 cts.
No. 27	3.30 cts.
No. 28	3.50 cts.
No. 29	3.60 cts.
No. 30	3.85 cts.

Black Annealed Sheets:

Nos. 3 to 8	1.70 cts.
Nos. 9 and 10	1.75 cts.
Nos. 11 and 12	1.80 cts.
Nos. 13 and 14	1.85 cts.
Nos. 15 and 16	1.90 cts.

Box Annealed Sheets:

Nos. 17 to 21	2.20 cts.
Nos. 22 to 24	2.25 cts.
Nos. 25 and 26	2.30 cts.
No. 27	2.35 cts.
No. 28	2.40 cts.
No. 29	2.45 cts.
No. 30	2.55 cts.

Prices for sheets at Chicago for shipment from stock are as follows:

	Cts. per lb. Black.	Galvanized.
No. 10	2.25	3.20
No. 12	2.30	3.20
No. 14	2.35	3.20
No. 16	2.45	3.20
Nos. 18 and 20	2.80	3.35
Nos. 22 and 24	2.85	3.50
No. 26	2.90	3.70
No. 27	2.95	3.90
No. 28	3.00	4.10
No. 30	3.30	4.50

Usual extras for extreme width.

The following New York quotations on sheets are for 500-bundle lots and over, f. o. b. mill:

Hexagon	9	120	.84	8.40
Champion	6	140	.60	6.00

Post hole augers with blades 6-in., 7-in., 8-in. or 9-in. can be bought for $1.00 each.

Grading and Road Plows.—For grading and road plows net prices at Chicago are about as follows:

Railroad or Grading Plows.

No. of horses.	Weight, lbs.	Cut, ins.	Price, each.	Extra points, each.
2 to 4	150	10	$18.50	$4.25
4 to 6	175	10	22.00	4.25
6 to 8	230	12	26.00	5.15
12 to 14	280	12	35.00	5.75

Contractors' or township plows, right or left hand, cutting a furrow 10 ins. wide and from 6 ins. to 12 ins. deep, and weighing 145 lbs., can be bought for $16.50 each. A heavier plow, weighing 205 lbs., costs $20 each. Extra points are not included in above price, but can be bought for $2.25 each extra. Road plows, all steel, with cast iron, cutting 12 ins., and weighing 170 lbs., can be bought for $21. Rooter or hard pan plows weighing 305 lbs. cost $30 each.

Scrapers.—Net prices at Chicago on the several kinds of scrapers named below are as follows:

Ox Shovels.

Size No.	Approx. capac., cubic feet.	Top of back to cutting edge.	Width, ins.	Depth, ins.	Weight, lbs.	Price, each.
		Size of Bowl.				
0	10	36	35	11½	133	$13
00	13	38½	37	13½	178	17
000	17	46	42	16	210	21

These shovels are made of pressed steel and are used for ditching along railroad tracks. They are usually drawn by locomotives. The above prices are for steel bail for No. 0 and chain bails for Nos. 00 and 000. The shovels have wooden handles 3x48 ins.

Buck Scrapers.

No.	Capacity, cu. ft.	Cutting edge width, ft.	Bowl gage, No.	Ends, ins.	Cutting edge width, thickness	Weight, lbs.	Price, each.
3	12	3	10	¼	13½x⅜	325	$18.75
2	14	4	10	¼	13½x⅜	350	19.50
1	18	5	10	¼	13½x⅜	375	21.00

No. 1 tongue scrapers and ditchers, 48 ins. wide, and weighing 133 lbs., sell at the net price of $7 at Chicago. Flat board scrapers, 48 ins. wide, and weighing 75 lbs. each, can be bought at the net price of $5.50 each.

Net prices at Chicago for drag scrapers are as follows:

	Each
No. 1. 7-ft. capacity, with runners	$5.15
No. 2. 5-ft. capacity, with runners	4.85
No. 3. Ditching scraper, 3 cu. ft. capacity.	4.70

The above prices are for scrapers having a bowl without seam or lap, with handles on top. For drag scrapers with bowls pressed from a single sheet of specially hardened steel and with handle sockets on the sides, net prices are as follows: 7 cu. ft. capacity, 94 lbs. weight, with runners, $4.86 each; capacity 5 cu. ft., 80 lbs. weight, with runners, $4.55. For drag scrapers without runners deduct 30 cts. from above prices; for drag scrapers with double bottoms add 50 cts.

Shovel Handles.—Net prices at Chicago for white ash "D" shovel, spade and scoop handles are as follows:

	Per doz.
Shovel, bent and riveted	$2.55
Spade, bent and riveted	2.46
Scoop, bent and riveted	2.55
Ditching spade, bent and riveted	3.00
Shovel or spade, straight, riveted	2.46
Shovel, straight, Maynard pattern	2.46

The net prices for long shovel, spade and scoop handles are as follows.

	Per doz.
4½-ft., shovel, bent	$2.40
4½-ft., spade, bent	2.10
4½-ft., scoop, bent	2.40
4½-ft., shovel, straight, Maynard pattern	2.10

Malleable "D" with wood head and malleable fork and socket can be bought for $1.00 per doz. Malleable "D's" with iron head cost $1.25 per doz.

Tool Handles.—Net prices at Chicago for tool handles in full crate quantities are as follows:

	Per doz.
Nail hammer, adze eye, 14-in	$0.45
Riveting hammer, 12-in	.40
Riveting hammer, 14-in	.40
Blacksmith, 18-in.	.50
Blacksmith, 20-in.	.60
Hatchet, regular, 14-in	.45
Hatchet, broad, 18-in	.60

The above are for second growth hickory with wax finish, clear and white, and free from all imperfections. They are packed 5 doz. to the case. The net prices for hickory axe handles, both single bitted and double bitted, 36 ins. long, are $2.45 per doz. for extra grade and $1.25 for No. 1 grade. Railroad pick handles, 36 ins. long, can be bought at $2.88 per doz. for extra grade second growth hickory, at $2 for second growth ash, and at $1.50 for second growth hickory, plain finish. The net prices for sledge, tool and maul handles are as follows:

Length, ins.	Price per dozen. Extra grade.	No. 1 grade.
24	$1.00	$0.70
28	1.25	.80
30	1.40	.95
36	1.70	1.15

Grub hoe handles, 36 ins. long, of second growth hickory, with wax finish, can be bought for $2.90 per dozen. Adze handles can be bought for $2.52 per doz.

Tampers.—The net prices for tampers with handles are as follows, No. 1 having steel plate base, No. 2 a cast plate base and No. 3 a round cast plate base:

No.	Size base, ins.	Wght. finished.	Price each.	Price per doz.
1	5 x 8	13	$1.50	$15.00
1	10x10	16	1.65	16.50
1	12x12	26	1.80	18.00
2	6 x 6	8	.78	7.80
2	6 x 7	13	.91	9.10
2	7 x 8	14	.98	9.80
2	8 x 8	15	1.04	10.40
2	10x10	20	1.25	12.50
3	5 x 6	14	1.43	14.30
3	7 x 7	20	1.50	15.00
Curb	1 x 3½	3	.62	6.20
Curb	4 x 4	5½	.78	7.80
Curb	3½x6	6½	.82	8.20
Comb. curb	1x3½	8½	1.50	15.00

The above prices are for tampers with wooden handles.

Wooden Wheelbarrows.—Net prices at Chicago for wooden wheelbarrows in quantities are as follows: Full bolted wooden railroad wheel barrows, with heavy steel wheel, 16½ ins. in diameter, sells at $1.85 each, or $19.75 per doz. Bolted wooden mortar barrows, weighing 60 lbs. each, with tight box, 10 ins. deep at handles and 13 ins. at wheel, sells at $2.75 each, or $27.50 per doz. Bent handled wooden stone barrows can be bought at $3.50 each, or $40.75 per dozen. Folding wooden barrows, with removable sideboards and double frames, 4 cu. ft. capacity, sells at $3 each, or $32.50 per doz.

Tents.—The following are the net prices at Chicago for stable tents, stable tent roofs and wall tents of the sizes commonly used by contractors and engineers:

Stable Tents.

Size.	Wall.	Pole.	10-oz. double filling or 8-oz. army duck.	12-oz. double filling or 10-oz. army duck.
24x28	5	12	$ 89	$101
24x42	5	12	122	136
24x60	5	12	164	185
24x75	5	12	206	221

The above prices are for stable tents complete with poles, stakes, guys and two tackles for setting up.

Stable Tent Roofs.

Size.	Perpendicular.	10-oz. double filing or 8-oz. army duck.	12-oz. double filling or 10-oz. army duck.
24x28	7	$ 58	$ 65
24x42	7	82	92
24x60	7	116	128
24x75	7	138	156

The above prices are for stable tent roofs with gable ends, but without walls, complete with poles, stakes, guys and two tackles for setting up.

Regular Wall Tents.

Size.	Height of center.	Height of wall.	10-oz. duck, single filling.	10-oz. duck, double and twisted filling or 8-oz. army.
9½x12	7½	3	$10.55	$11.75
12x14	8	3½	14.15	18.80
14x18	9	4	20.85	23.25
16x24	11	5	31.65	35.20
18x30	11	5	42.65	47.45

The above prices are for wall tents complete with poles, stakes, guys and keys; the prices do not include flies.

PAVING AND ROAD CONSTRUCTION.

Materials.

Asphalt.—The prevailing current prices for asphalt at Chicago and vincinity are as follows:

Refined Trinidad asphaltum, $25 per net ton f. o. b. New York. Waterproofing asphaltum, $25 to $35 per net ton for natural asphalt in solid form.

Vitrified Brick.—The current prices for vitrified paving brick, f. o. b. Chicago, are $24 to $26 per M.

Granite Blocks, Curbing, Cross-walks, Etc.—The following are the Chicago prices for carload lots, shipments only f. o. b. Chicago, for granite blocks, etc.,

No. 1 standard blocks, $1.55 per sq. yd.

No. 1 special dressed blocks, $2.00 per sq. yd.

Granite curbing, 5x14 ins., 65 cts. per lin. ft.

Granite cross-walks, 5x18 ins., 70 cts. per lin. ft.

Crushed granite, macadam sizes, $1.75 per cu. yd.

Crushed granite, sizes between ¼ in. and 1 in., $2.00 per cu. yd.

Granite screenings, $3.00 per cu. yd.

Rough stock in sizes under 50 cu. ft., 65 cts. per cu. ft.

Paving Cement, Macadam Binder. — Current prices for Texaco brands are as follows:

Texaco paving cement, $25.00 per ton, carload, f. o. b. New York harbor.

Texaco macadam binder, 90-95 per cent asphalt, 11 cts. per gallon, in bulk, f. o. b. New York harbor and Philadelphia.

Wood Blocks, Creosoted.—The following are the approximate current prices for the above:

4-in. deep creosoted blocks in Chicago at the present time cost in the neighborhood of $1.85 per sq. yd., when treated with 16 lbs. of oil to the cubic foot of timber, and $1.95 per yd. when treated with 20 lbs.

NET PRICES OF TOOLS USED IN PAVING AND ROAD CONSTRUCTION.

Asphalt or Tar Rakes.—Asphalt or tar rakes made of solid steel, with drop shank, strap ferrules, 5-ft. selected white ash handles and 18-in. square iron shank, sells at a net price for quantities, at Chicago, of $12.85.

Asphalt Mattocks.—The net prices for asphalt mattocks in quantities, at Chicago, are as follows. For a mattock with crucible steel cutter and chisel ends, weighing 9 lbs., the cost is 90 cts. each, or $9 per doz. A mattock with double cutter, weighing 8 lbs., can be bought for 60 cts. each, or $6 per doz.

Bricklayers Hammers.—The following are net prices for bricklayers hammers, in quantities, at Chicago:

Weight without handle.	Price per dozen. Plain eye.	Adze eye.
1 lb. 2 oz.	$4.95	$5.85
1 lb. 8 oz.	5.40	6.30
2 lbs.	5.85	6.75
2 lbs. 8 oz.	6.30	7.20

Cement Workers' Tools.—The following are current net prices, f. o. b. Boston, Mass., for tools used in constructing and finishing cement sidewalks:

Jointers.

	Per doz.
Iron, nickel plated	$ 5.60
Iron, nickel plated, steel center	5.80
Solid bronze	12.80

The above are for jointers, 2¾ ins. wide by 6 ins. long, with both ends rounded; cuts ½ in. deep.

For jointers 9 ins. long, 3 ins. wide, cutting ½ in. deep, prices are as follows:

	Per doz.
Iron, nickel plated	$11.52
Solid bronze	17.28

Narrow Jointers.

Iron, nickel plated, ½-in. cutting blade	$ 6.40
Solid bronze, ½-in. cutting blade	13.60

These jointers are 1¾ ins. wide, 8 ins. long, and have both ends rounded. The same prices prevail for the above jointers with ¼-in. blade.

Straight End Jointers.

	Per doz.
Iron, nickel plated	$6.40

Iron, nickel plated, steel center	8.00
Solid bronze	13.60

The jointer is 3 ins. wide by 6 ins. long, with one end straight and the other rounded. The above prices also prevail for narrow, straight-end jointers 1¾ ins. wide and 8 ins. long with one straight end and one rounded end.

Corner Tools.

	Per doz.
Iron, nickel plated	$ 5.60
Solid bronze	12.80

The above is 6 ins. long with sides 1½ ins. long.

Gutter Tools.

	Per doz.
Iron, nickel plated, for gutter 1 in. deep, 3½ ins. wide	$11.52
Iron, nickel plated, for gutter 1½ ins. deep, 5 ins. wide	14.40
Solid bronze, for gutter 1 in. deep, 3½ ins. wide	17.28
Solid bronze, for gutter 1½ ins. deep, 5 ins. wide	24.00

Driveway Groovers.

Iron, nickel plated, ¾ in. cut	$11.52
Solid bronze, ¾-in. cut	17.28

Same prices for a tool making a wider groove. The above grooves are 3 ins. wide by 9 ins. long with both ends rounded.

Radius Tools.

	Per doz.
Iron, nickel plated, ⅜-in. or ¾-in. radius	$4.80
Solid bronze, ⅜-in. or ¾-in. radius	9.60

Edgers.

Reversible handle edgers, 2½ ins. wide, 5½ ins. long, with a radius of ⅜ in., made of rolled bronze, cost $12 per doz.

Square edgers, 3 ins. wide, 6 ins. long, both ends rounded, cutting edge 1½ in., cost as follows:

	Per doz.
Iron, nickel plated	$ 8.00
Solid bronze	13.60

Curbing edgers, 3½ ins. wide, 6 ins. long, with 2-in. turned edge and radius of 1½ ins., can be bought at the following figures:

	Per doz.
Iron, nickel plated	$11.52
Solid bronze	17.28

Curbing edgers 10 ins. long cost as follows:

	Per doz.
Iron, nickel plated	$17.60
Solid bronze	26.88

Bevel edgers, 2¾ ins. wide and 6 ins. long, with ⅜-in. bevel, cost as follows:

	Per doz.
Iron, nickel plated	$ 7.60
Solid bronze	12.80

The above prices also prevail for bevel edgers with ⅝-in. bevel and for ⅜-in. edgers, 6 ins. long. For ⅜-in. edgers, 10 ins. long, the following are the prices:

	Per doz.
Iron, nickel plated	$14.40
Solid bronze	24.00

Narrow edgers, 8 ins. long, 1¾ ins. wide, can be bought at the following figures:

	Per doz.
Iron, nickel plated	$8.640
Solid bronze	14.40

The last named prices also prevail for edgers 3 ins. wide, 6 ins. long, with 1-in. turned edge and ¾-in. radius. For ¾-in. edgers, 10 ins. long, the cost is as follows:

	Per doz.
Iron, nickel plated	$14.40
Solid bronze	24.00

Rollers.

Indentation rollers 10 ins. long and 4 ins. in diameter cost as follows:

	Each
Iron, nickel plated	$3.20
Bronze	9.60

For indentation rollers 8 ins. long and 3 ins. in diameter the cost is as follows:

	Each
Iron, nickel plated	$ 5.60
Bronze	11.20

Driveway rollers, 10 ins. in diameter and 4 ins. long, having ½-in. grooves 2 ins. apart, cost:

	Each
Iron, nickel plated	$3.20
Solid bronze	9.60

For rollers making grooves 3 ins. apart the cost is as above. Line rollers, 10 ins. long and 4 ins. in diameter, 6 grooves to the inch, cost as follows:

	Each
Iron, nickel plated	$3.20
Solid bronze	9.60

Same prices prevail for line rollers with grooves ⅜ in. apart. Roller edgers ⅜-in. to ¾-in. radius, cost as follows:

	Per doz.
Iron, nickel plated	$ 8.[—]0
Solid bronze	14.40

Roller jointers 2 ins. long and 2 ins. in diameter cost the same as the roller edgers last mentioned.

Paving Rammers.—Net prices at Chicago for paving rammers are as follows.

Kind.	Weight, lbs.	Price, each.
Granite rammer	56	$10
Cobblestone rammer	50	[—]

Rollers.—Hand rollers, 1-horse rollers and reversible road rollers can be bought at the following net prices, f. o. b. Chicago.

Hand Rollers.

No.	Diameter. Ins.	L'gth. Ins.	No. sections.	Face. Ins.	Weight. Lbs.	Price each.
1	15	15	2	7½	150	$ 7.15

83.	48	3¾	3	15	4,000	186
84.	48	5	4	15	5,000	228
85.	48	6¼	5	15	6,000	270
86.	54	3¾	3	15	6,000	276
87.	54	5	4	15	8,000	363
88.	54	6¼	5	15	10,000	450

Reversible Road Rollers.

No.	Weight. Tons.	Diameter. Ins.	Width. Ins.	Price each.
10.	4	56	54	$360
20.	5	58	54	450
30.	6	60	54	540

Stone or Ballast Forks.—Net prices for extra grades stone or ballast forks in quantities, at Chicago, are as follows:

No. tines.	Length tines. Ins.	Width fork. Ins.	Weight per doz. Lbs.	Price per doz.
8.	13½	11¼	76	$12.00
10.	13½	11½	88	15.00
12.	11½	13¾	96	17.40

The above prices are for forks with natural finish, wide strap ferrules and heavy caps, with wood "D" ash handles.

Stone Hooks.—Hop or stone hooks in quantities can be bought at Chicago at the following net prices: 4-tined, diamond backed, extra heavy hook, 5 ft. handle, at $9 per dozen; 4-tined

diamond backed, light hooks, 4½ ft. handles, at $7.80 per dozen.

Two-Man Rakes.—Two-man rakes, used in leveling broken stone, sell at the following net prices, for quantities, at Chicago:

	Per doz.
10-tooth	$21.25
12-tooth	24.75
14-tooth	28.25

RAILWAYS.

Materials and Supplies.

Rails and Track Supplies.—Current rates at Chicago, f. o. b. cars at works at Chicago and vicinity, are as follows on lots of rails 500 tons and over with necessary fastenings:

Standard quality No. 1 Bessemer rails, $28 per gross ton.

Standard quality No. 1 open hearth rails, $30 per gross ton.

Angle bar splices, 1.50 cts. per lb.

Spikes, 1.85 cts. per lb.

Bolts with square nuts, 2.45 cts. per lb.

Bolts with hexagon nuts, 2.60 cts. per lb.

The prices mentioned contemplate furnishing rails in 33-ft. lengths with 10 per cent of shorts, diminishing by even feet down to 24 feet. Where rails are required in 60-ft. lengths, add $2.00 per ton to the above prices. If ordered in lots less than 500 tons down to carloads, there is an additional cost of $2.00 per ton to the prices mentioned above.

Other quotations on light rails at Chicago are as follows:

	Per ton
20 to 45 lb.	$27.00
50 to 55-lb.	27.50
16, 20 and 25 lb.	28.00
12 lb.	29.00

The following quotations are per gross ton delivered at Chicago:

Relaying rails, standard sections....$24 to $25.00

Old iron rails..... 19 to 19.50

Old steel rails, less than 3.10 17.50 to 17

Tools.

Bars.—Net prices at Chicago for solid steel bowl bits, lining bars, claw bars and hammered tamping bars, are as follows:

	Per lb.
Crowbars	4 cts.
Lining bars	4 cts.
Claw bars, goose neck	4 cts.
Claw bars, with heel	4 cts.
Railroad tamping bars	4½ cts.

Track Tools.—Net prices at Chicago for track tools are as follows:

	Per lb.
Mauls, 6, 8, 10 and 12-lb.	5½ cts.
Chisels, 4½, 5 and 7 lb.	5 cts.
Pinches, 4, 4½ and 5 lbs.	5 cts.
Railroad track tongs, 17 lbs., pair	7½ cts.
Rail forks, each 15 lbs.	7 cts.

SEWERAGE AND WATER SUPPLY

Materials and Supplies.

Water Pipe.—The following are about the present current prices per net ton, f. o. b. New York, from stock for bell and spigot cast iron pipe.

	Per net ton.
4 in.	$28.50
6 in. to 12 in.	27.50
16 in. up	27.50

For gas pipe add $1 per net ton.

Cast iron pipe specials are 3½ cts. per lb.

Lead pipe is $6.10 per 100 lbs.

Merchant Pipe.—Net prices on wrought merchant pipe, f. o. b. New York, from stock are as follows:

	Cts. per foot. Black.	Galvanized.
⅛-¼ in.	1.71	2.59

General Prices at New York City.—The following are general prices at New York City for some materials and supplies used in construction work:

Rip rap, from 60 to 70 cts. per yard alongside; building stone, from 65 to 80 cts. per yard alongside; steam ashes (hard coal), 20 cts. to 30 cts. per yard alongside; steam ashes (soft coal), 15 to 20 cts. per yard alongside; earth fill, 12 to 20 cts. per yard alongside; earth fill, 20 to 35 cts. per yard in place; gravel, 75 to 85 cts. per yard alongside; sand, 35 cts. alongside; disposing of excavations, 12 to 18 cts. per yard, scow measurement; derrick boats, $10 to $25 per day as per capacity and lifting power; flat scows for hire, $5 to $6 per day.

Methods of Refuse Collection and Disposal in Boston, Mass., with Some Cost Data.

The general plan of collection followed is to divide the refuse into two general classes: (1) garbage proper and (2) ashes and rubbish. In some sections of the city a further separation is made into ashes and combustible refuse. There is also another class of waste, the refuse from the markets, which is not collected by the city, but which is disposed of in connection with the city wastes. The quantities of these several kinds of refuse in 1908 were as follows:

Kind of refuse.	Total tons.	Ave. tons per day.
Ashes	311,586	998
House offal	78,615	252
Waste and rubbish	13,566	44
Market refuse	9,382	30
Total and average	413,149	1,324

The city is divided into 9 sanitary districts and the following tabulation shows the population, tons of refuse per capita, and cost per ton per capita for collection and disposal for 1908:

Sanitary district.	Population per acre	Pounds per capita	Cost per ton per capita
1 South Boston	50	795	$0.91
2 East Boston*	36.2	796	0.60
3 Charlestown	47.7	1,017	1.05
4 Brighton*	8.8	1,216	0.82

*Collection and disposal by contract.

In general, it will be seen, the collection in the suburban districts is made by contract and in the more settled and in the business districts by day labor.

The total amount of refuse collected by contract in the four districts indicated was 83,720 tons and 133 men and 88 horses were employed by the contractors. These contractors also disposed of the refuse collected by them, feeding the garbage to hogs. Two or more contractors handled the refuse in each district, the tonnage handled by each and the contract price per ton being as follows:

District.	Kind of Refuse.	Tons.	Price per Ton.
E. Boston, ashes and waste		8,010	$0.78
E. Boston, offal		5,806	1.13
Brighton, ashes and waste		4,925	0.68
Brighton, offal		3,125	0.74
W. Roxbury, ashes and waste		8,018	0.68
W. Roxbury, offal		2,230	1.12
Dorchester, ashes and waste		40,697	0.64
Dorchester, offal		10,909	1.83

The total tonnage of 83,720 tons cost to collect and dispose $92,389, or an average of $1.10 per ton.

The total tonnage collected by day labor was 320,047 tons, with a force consisting of 607 men and 260 horses. The city also maintains a shop employing 38 mechanics to manufacture and repair equipment. To collect and dispose of this 320,047 tons cost in 1908 $648,866, or an average of $2.03 per ton.

In comparing the costs of day labor and contract work the report says:

The cost of contract work is doubtless lower than would be the case if the contractors were precluded from profiting by feeding the garbage to swine, and there are other features of the department's contract work, notably the shorter hauls and the elimination of the charges for transportation to sea, tending to complicate any comparison with the cost of day labor.

Taking day labor and contract work together it will be seen that a total of 403,767 tons, exclusive of market refuse, was collected and disposed of at a total cost of $741,255, or a unit cost of $1.84 per ton.

Of the 311,586 tons of ashes and house dirt collected during 1908, 87,000 tons, or 28 per cent, were discharged upon the city scows and dumped at sea beyond the harbor limits. The remaining 244,586 tons were deposited upon dumps in various parts of the city. Of the 78,615 tons of garbage, 67,454 tons were delivered to the New England Sanitary Product Co. and conveyed to the reduction works of the company at Spectacle Island. The remainder, amounting to 11,161 tons, or 14 per cent of the total quantity collected, was disposed of by the suburban district contractors and used, to a greater or less extent, for the feeding of swine beyond the city limits.

Of the combustible waste and refuse, 12,050 tons were conveyed to the refuse destructor, where the material is sorted, a part of it sold and the remainder burned, the ashes being discharged upon the dumping scows. The remaining combustible waste and refuse, amounting to 1,516 tons, was disposed of upon dumps.

The market wastes from the downtown section of the city, amounting in 1908 to 9,382 tons, were discharged upon the dumping scows and disposed of at sea with the ashes and other refuse, the total carried to sea being thus 96,382 tons. Market wastes from other sections of the city were disposed of in connection with the house dirt and ashes. Small quantities of refuse are disposed of by other means, which are negligible in considering the general question; for instance, a number of hotels and restaurants dispose of their own garbage. Also several persons have established routes for the collection of paper, which is understood to yield them some revenue.

The report discusses disposal by incineration and by reduction, and makes the following recommendation:

The commission recommends the disposal of the city's entire waste by burning in modern incinerators of the so-called English "Destructor" type, operated by forced draft and at a temperature of not less than 1,500° F. Such destructors should be introduced gradually, beginning with the district in which the need is most urgent and extending to other districts of the city as required.

The plan of combining disposal by incineration in destructor plants of the type recommended above, with a garbage reduction plant so designed as to prevent the escape of foul odors, might enable the city to dispose of its waste effectually and satisfactorily by contract, at less cost than by the burning of mixed waste in its own destructor plants. The contract plan tentatively outlined to the commission involved both the collection and disposal of all wastes at a cost much less than would be required if the work were done by the city. It has already been pointed out that this plan admits of separating the collection of the waste from its disposal, and the commission recommends that if the plan be again presented, either in its original form or as thus modified, the desirability of its adoption must be given careful consideration.

Whether the present methods of disposal of refuse are continued, or whether the method of incineration with the accompanying advantage of a single collection of unseparated material is adopted, the question remains whether it is more advantageous to the city to do the work itself or to let it out to one or more contractors.

The majority of the members of the commission are of opinion that it would be to the advantage of the city in either case to do the work by contract, and, if a suitable contractor can be found, that it would be better to let the entire work of collection and disposal for the whole city to one contractor. The reasons in favor of this view are briefly as follows:

They believe that the work can be done more cheaply by contract, as contractors have more control over their working forces than the city departments have over theirs. There is less chance for politics to enter in and more incentive to do the work economically. Especially, if a method of disposal is adopted in which there are products from the refuse to be sold, they believe that the city would be at a great disadvantage in disposing of such products as compared with a private concern. They also think it desirable that the city should escape a large investment in horses, carts and similar equipment, which are assets of fast depreciating value and susceptible of great waste and extravagance in their initial purchase if attended to by inexperienced or inefficient officials. There are other advantages of the contract system, as, for instance, that the more work that is let out by contract the less liability there is of having pensioners or incompetent or superannuated men on the city pay rolls. Further, that it is an advantage to know just what the expense will be year by year, and not have the amount fluctuate violently according to the competence or incompetence of the head of a city department. They find from the experience of the City of Boston that work of this character has been done by contract for much less than the cost by day labor, and they are of opinion that, with competent supervision, the work can be as well done by contract as by day labor. The danger that a contractor will employ inefficient or low-grade and objectionable men or teams to collect refuse from the houses of the citizens can, in the opinion of the majority of the commission, be readily overcome by suitable provisions in the contract. They feel that if the city officials having charge of the enforcement of the contract show any disposition to do their duty, there will be no difficulty in detecting the contractor in the violation of such provisions, because practically every citizen will be glad to complain of any inconvenience to which he may be put by the contractor or his men.

*Abstracted from the report of the special commission to investigate the subject of garbage collection and disposal in Boston, Mass.

Technical Society Meetings.

The list following names those technical societies in which engineers and contractors are most interested, whose meetings are to be held within three months of the date of this issue. There are given for each society listed the date and place of meeting and the name and address of the secretary, to whom all communications and inquiries should be addressed.

American Water Works Association.—April 26-30, 1910. Annual convention at New Orleans, La. Headquarters, Gruenwald Hotel. Secy., J. M. Diven, Charleston, S. C.

American Electrochemical Society.—May 5-7. Annual meeting at Pittsburg, Pa. Secy., Jos. W. Richards, South Bethlehem, Pa.

Appalachian Engineering Association.—May 6-7. Annual meeting at Winston-Salem, N. C. Secy., Henry M. Payne, Morgantown, W. Va.

National Fire Protection Association.—May 17-19. Annual meeting at Chicago, Ill. Secy., Franklin H. Wentworth, 87 Milk St., Boston, Mass.

American Railway Association.—May 18. Annual meeting at New York City. Secy., W. F. Allen, 24 Park Pl., New York City.

International Railway Fuel Association.—May 23-26. Annual meeting at Chicago, Ill. Secy., D. B. Sebastian, 327 La Salle Station, Chicago, Ill.

National Electric Light Association.—May 23-28. Annual meeting at St. Louis, Mo. Secy., T. C. Martin, 29 West 39th St., New York City.

American Society of Mechanical Engineers.—May 31-June 3. Spring meeting at Atlantic City, N. J. Secy., Calvin W. Rice, 29 West 39th St., New York City.

Engineers' Society of Pennsylvania.—June 1-3. Annual convention at Harrisburg, Pa. Secy., E. R. Dasher, Gilbert Bldg., Harrisburg, Pa.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Steel and Concrete.—Paper, 6x9 ins., 32 pp., ill. Blaw Collapsible Steel Centering Co., Pittsburg, Pa.

Contains an able discussion by Mr. J. F. Springer on reinforced concrete in its application to various kinds of concrete construction, such as bridges, piling, chimneys, fireproof construction in buildings, marine construction, telegraph poles, railroad ties, etc. The use of collapsible steel centering in different kinds of concrete work is also shown.

Foundry Machinery.—Paper, 3x5½ ins., 24 pp. Northern Engineering Works, Detroit, Mich.

A booklet containing descriptions and views of some of the foundry equipment manufactured by this company.

Non-Chokable Diaphragm Pumps. — The Barnes Mfg. Co., Mansfield, Ohio.

A two-page circular pamphlet calling attention to the non-chokable diaphragm pumps made by this company.

ENGINEERING-CONTRACTING

A Consolidation of Engineering-Contracting—Contract News—Engineering World—The Dirt Mover.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal development in the way of new railroad construction work has been the report that the Western Maryland Ry. had already taken bids for constructing its extension from Cumberland, Md., to New Castle, Pa. We have no information at this time as to the successful contractors.—As was expected the directors of the Atchison, Topeka & Santa Fe Ry. have authorized an issue of $43,686,000 50-year 4 per cent convertible bonds to enlarge the capacity of the lines now in operation.—A large contract is to be let shortly by the East Side Lever Sanitary District, of East St. Louis, Ill. This contract calls for moving some 1,500,000 cu. yds. of dirt and is estimated to cost $800,000. This is the first piece of work in the extensive improvements planned by the district, for which it is planned to expend about $6,500,000.—The principal irrigation contract for the past week was secured by the Wogan-Wilcoxon Construction Co., of Denver, Colo. This contract called for the construction of the Sanchez dam and dike and the Culebra-Sanchez canal for the Costilla Estates Development Co., and amounted to $500,000.—Among the railroad contracts of the week are the following: Costello Bros., for 50 miles of betterment work on the Big Four, between Indianapolis, Ind., and Muncie, Ind.; E. G. Spaulding, for the first 50 miles of grading work for the Osage & Western Ry., west from Vinita, Okla.; J. D. McArthur & Co., Winnipeg, for the construction of a branch line for the Grand Trunk Pacific Ry., south from Regina, Sask., to the American boundary near Portal; Hartley & Ford, Bay City, Tex., for the grading work for a 19-mile section of the Houston-Galveston Interurban Ry.; Continental Construction Co., Caney, Kan., for the construction of the first 5-mile section of the Cherryvale, Oklahoma & Texas Ry.; J. C. Carland & Co., Toledo, O., for the realignment of the Big Four tracks between Middleton and Miamisburg, the contract amounting to about $80,000, and for constructing the last section of the Belt Line into Cleveland, O., this contract amounting to about $1,000,000.—The Pennsylvania R. R. last week opened for public inspection its tunnel and terminal improvements from Harrison, N. J., to Sunnyside, L. I. The section is 16.5 miles long and the company has thus far expended $102,000,000 and will expend $16,000,000 before the improvement is completed. Train service is due to begin late in June, or early in July, with an initial card of 1,000 trains daily.—Extensive improvements are proposed near Hammond, Ind., if a reported plan of the New York Central lines is carried out. According to this plan Gibson, a place near Hammond, is to be made the operating center for the lines. The plan is said to contemplate the expenditure of about $20,000,000 for improvements to the system. The chief of these will be the double tracking of the Chicago, Indiana & Southern R. R. all of the way from Indiana Harbor to Danville. This would open up a north and south railroad system between Indiana Harbor and New Orleans.

Eight Eighty Eight.

At a recent oyster roast at Galveston, Texas, Julius Kruttschnitt, director of maintenance of the Harriman system, was high man in number of oysters consumed and was awarded a medal in honor of his achievement. Mr. Kruttschnitt acknowledged the honor and the medal in the following manner:

I acknowledge with keen pleasure
Your medal, which I'll treasure,
Though for such a poor performance
I feel it was not deserved;
While I had the table beaten,
I could easily have eaten
A barrelful of oysters,
As luscious as were served.

At a function so important
I felt I surely Ortont
To eat as many oysters
As I really might have ate,
So while I took the medal
I was pressing the soft pedal
On a hunger which, for oysters,
A Roast can not abate.

Your tally, as recorded,
And for which I am awarded,
Announces to the world at large
I ate seven eighty-nine,
But this score is not amazing
When I tell you, without fasing,
I eat as many oysters
Each day before I dine.

In your figures too I notice
A slight lapsus oysterotis,
For the number I demolished
Exceeded what you state;
While I practiced self denial,
Yet my oystermeter dial
Records in figures clearly
I ate eight eighty-eight.

A Tip on the Water Jet.

The water jet has been employed for so many years as an aid in putting down piles that its use is familiar to all contractors. Some contractors, however, in using the jet make the mistake of having too small a nozzle and too great a velocity of discharge of the water. A small nozzle and great velocity seems to compact the material and in many cases acts as a hindrance in putting down the piles. On the other hand a large nozzle and a large volume of water under low pressure seem to lift out the particles and clear the way for the pile. Some contractors are now using low pressure, high volume pumps with the water jet and are meeting with much success. In one case that came under our observation the contractor was using a 4-in. hose and a 2½-in. nozzle. So our tip on the water jet seems to be a large nozzle.

Drainage of Southern Swamp Lands.

If it is right for the government to advance funds for the construction of irrigation systems for the bringing of water to lands that need it, it is equally right for the government to advance funds for devising plans for taking away water from the lands that don't need it. Such seems to be the general belief in the southern states, which have more than their share of the 76,000,000 acres of wet and overflowed swamp land in the United States. Acting on this belief the southern states are asking for a small government appropriation with which to make surveys so that the work of reclaiming these lands can be carried out by private capital. Louisiana, which has 7,000,000 acres of overflowed land within its boundaries, is taking the lead in the matter, and has already sent several delegations to Washington to secure the government's aid in starting the work of reclamation by making comprehensive surveys.

Revised Estimate.

James J. Hill has revised his estimate of the country's needs for additional railway facilities. Some four years ago he announced that it would require $1,100,000,000 per year for five years to make this country's railroad facilities equal to the demands upon them. He now says that $1,600,000,000 a year for the next six years is needed by the railroads of the country to escape congestion such as it has never before experienced. In a recent interview in New York city he said: "This country is up against a stone wall and it can't see either end or top. The importance of our railroads' condition is not realized. To my way of thinking it is of more importance than a total failure of crops. Congestion of freight such as has been experienced this winter is not caused by too few cars. More equipment would only make more congestion. What the country needs is additional terminal facilities and track sidings."

A mechanic's lien on a street of a Kentucky city has been filed by a supply company to enforce the collection of a claim amounting to some thousand dollars, alleged to be due for material used in paving the street. The lien makes the city and a street railway company traversing the street with its track defendants. If the claim is not paid, the lien gives the plaintiffs the right to sue for debt and to sell the street to the highest bidder.

In order to renew the life of a franchise which the New York State Public Service Commission had threatened to cancel, the New York Traction Co. ran an antiquated horse car over the asphalt pavement of Park row in that city. The company believes that it will not be necessary to operate any more cars over the route for at least a year.

An English railway expert is authority for the statement that a speed of 150 miles per hour by railway trains is technically possible today and will be commercially feasible within the next ten years, provided the railway serves great centers of population yielding a large amount of traffic. The motive power would be electricity, and as the high horse power required for the attainment of such speed would necessitate motors of enormous size and weight, it would be necessary to use three if not four rails.

Work has been resumed on the Arroyo Hondo irrigation project near Santa Fe, N. Mex. Three dams are to be built and it is planned to have one of these completed by June 1. E. E. Meice, of the office of Henry A. Allen & Co., Consulting Engineers, Chicago, Ill., is in charge of the work.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA

Surveys have been made for the projected 126-mile line of the Sacramento & Sierra Ry., which is to extend from Sacramento to Lake Tokai, Cal. Construction contracts have not been let as yet. J. M. Graham, 37 Stoll Bldg., Sacramento, Cal., is chief engineer.

INDIANA.

Tripeer & Son, Peru, Ind., have been awarded the contract by the city of Fort Wayne for doing its portion of the track elevation work at Calhoun St., Fairfield Ave. and Broadway St., at Fort Wayne.

The Triad Engineering & Construction Co., R. F. D. No. 1, Plymouth, Ind., wants teams for use on its contract in constructing the interurban line from Plymouth to South Bend. The company also wants two or three good grade builders, not foremen.

The contract recently let to Tripeer & Son, Peru, Ind., for track elevation work at Fort Wayne, Ind., mentioned in our last issue, includes 21,000 cu. yds. of earth excavation and 1,300 cu. yds. of concrete masonry. None of the work is to be sublet.

IOWA

Surveys are now being made for the projected line of the Charles City Western Ry. Co., and $300,000 of capital has been secured for the construction of this road. The work will be handled by the company. The projected length of this line to be built this year is 15 to 20 miles and the route is southwest from Charles City, Iowa. H. E. Bennett, Charles City, Iowa, is assistant general manager.

KANSAS.

The contract for constructing the first five miles of the Cherryvale, Oklahoma & Texas Ry., from Caney, Kan., has been let to the Continental Construction Co. of Caney, Kan. B. J. Dalton, Lawrence, Kan., is chief engineer of the Cherryvale, Oklahoma & Texas Ry.

The Gulf & Northwestern Railway has completed surveys and bonds to aid in the construction of the road have been voted by cities along the route throughout the state of Kansas. Construction contracts will be let soon. The projected length of this road is about 500 miles and it is to extend through the western tier of counties, starting at Sterling, Colo., and terminating at Oklahoma City, Okla. James A. Sprague, Goodland, Kansas, is vice-president.

MISSOURI.

The Hannibal & Northern Missouri R. R. Co. has completed surveys for its projected 98-mile line from Hannibal, Mo., to Kirksville, Mo. The necessary construction capital for all work to be done this season has been secured and contracts will be let in about 30 days. The Roberts & Abbott Co., Cleveland, O., is the engineer. F. W. Latimer, Galesburg, Ill., is president.

MONTANA

Surveys have been made for the Butte & Boise Ry. As projected, this line will be 400 miles long, and it is estimated that the cost of construction will be about $20,000,000. S. H. Bracy, 1606 Tribune Bldg., Chicago, Ill., is interested.

NORTH DAKOTA.

I. T. Adams, railroad contractor, Room 810, Columbus Savings & Trust Co. Bldg., Columbus, O., will sublet about 20 miles of good work, mostly slip scraper work and about 80 per cent of it borrow, on the Midland Continental Ry. between Edgeley and Jamestown, N. Dak. This is very nice work, as there is no rock nor timber to contend with, and the company wants this grading done so that the track can be laid this fall.

TENNESSEE.

The Tennessee Central R. R. Co. is contemplating some extensive improvements and extensions, but as yet nothing definite has been decided upon. Leon F. Lonnbladh, Stahlmar Bldg., Nashville, Tenn., is chief engineer.

TEXAS

The Tucumcari Portales & Gulf R. R. has completed surveys for the first 50 miles of its line and is now open for bids for constructing this section. The total projected length of this line is 250 miles and its route is via Texico or Portales to Pyote and south 125 miles. M. J. Healy, Pyote, is president.

The Arkansas Terminal Ry. Co. has made surveys for its projected 7-mile line to a connection with the S. A. & A. P. Ry., across Harbor Island to jetties. The capital for construction has been partly secured and construction contracts will be let in 30 days. The grading is now being thrown up by dredge by the Bowers Southern Dredging Co. of Galveston, Tex. C. S. Corrigan, Aransas Pass, Tex., is chief engineer, and E. O. Burton, San Antonio, Tex., is president.

The Texas Central R. R. has completed location from De Leon through Sipe Springs, Rising Star and Cross Plain. The contract has been let to Kamer Bros., general contractors, Sweetwater, Texas, who now have practically the entire line covered with sub-contractors. Material is being received in De Leon for track laying and bridge building, which will be pushed right along behind construction, with the intention of moving this year's crop. B. T. Quarles is engineer in charge of construction. C. H. Sharman, Waco, Tex., is chief engineer of the Texas Central R. R.

VERMONT

The Rutland Railway, Light & Power Co., Geo. S. Haley, general manager, Rutland, Vt., will build by day labor its extension from Fairhaven to Poultney, Vt. There will be seven miles of single track trolley line, 60-lb. rails, steam railroad construction, and two 3/0 trolley wires, bracket construction. The work requires 100,000 cu. yds. earth excavation, 10,000 cu. yds. rock excavation, 500 cu. yds. concrete masonry, 500 cu. yds. stone masonry and two girder 50 ft. steel bridges.

Power Developments, Levees, Drainage and Irragition Works.

ARKANSAS.

The Southern Drainage Co. of Paragould, Ark., has been awarded the contract for drainage work for Drainage District No. 9 of Clay county, Arkansas. The work includes 490,000 cu. yds. of earth excavation, and the contract price was 10 cts. per cu. yd. J. D. Mitchell, Rector, Ark., is the engineer.

GEORGIA

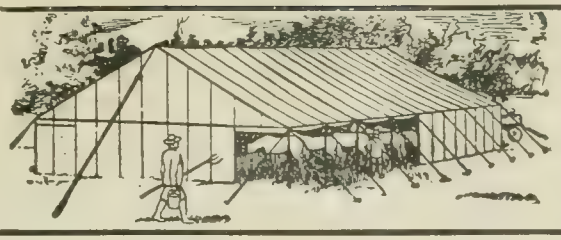
Geo. M. Gadsdere, Savannah, Ga., has been awarded the contract for constructing riprap revetment in seawall at Fort Screven, Ga., the contract price being $12 per ton for material and labor.

Bids were opened March 21 by Col. Dan C. Kingman, U. S. Engineers, Savannah, Ga., for dredging 23,100 cu. yds. of refractory material for the improvement of the harbor at Brunswick, Ga., the contract being let to P. Sanford Ross, Inc., Jersey City, N. J., at $2.80 per cu. yd. and $20 per month for board of inspectors. The other bids on the work were as follows: Coastwise Dredging Co., Norfolk, Va., $2.95 per cu. yd.; Roderick G. Ross, Jacksonville, Fla., $3.25 per cu. yd.

COLORADO

Contracts for the enlargement of the canal of the Otero irrigation district in Otero county, Colorado, were let March 26, as follows: Concrete work, Fox & Smith, Florence, Colo.; tunnel, William Leonard, Lamar, Colo.; dredge work, Sherwood Bros. of Indiana; excavation, Krang Bros., La Junta, Colo., J. H. Kellicher, La Junta, Colo., Allsworth, Foxworthy & Evans, La Junta, Colo., and J. R. Edgerton, La Junta, Colo. The contract is divided into sections and includes the following: Earth excavation, 563,706 cu. yds.; rock excavation, 35,000 cu. yds.; embankment, 25,000 cu. yds.; rock tunnels, 2,850 lin. ft.; 60 A-truss, 34-ft. span wood bridges and 1,000 cu. yds. of concrete masonry. The concrete work is to be completed May 1, 1910; other work March 1, 1911. Contracts for piling are to be let later. H. P. McKean, Opera House Block, Rocky Ford, Colo., is resident engineer and manager.

The contract for the Sanchez dam and dike and the Culebra-Sanchez canal has been awarded by the Costilla Estates Development Co. of Colorado Springs to the Wogan-Wilcoxon Construction Co. of Denver, Colo.; the basis of the contract being actual cost plus an agreed sum for profit. The company will also pay the contractors, as an incentive to economy, one-third of the amount saved under an agreed fixed maximum price, and the contractors agree to share one-third of the amount by which the fixed maximum price is exceeded. Construction is to start at once. The Costilla Estates Development Co. owns 548,000 acres of land in one tract in Costilla County, Colo., and Taos County, New Mexico; the waters of the Sanchez Reservoir will be used to irrigate 60,000 to 75,000 acres of valuable agricultural land on a fertile mesa about 15 miles from the reservoir. The Sanchez dam will be built of earth, laid in 9 inch layers, sprinkled and rolled, to a maximum height of 125 ft. and will be 1,500 ft. long on the crest with 20 ft. top berm, and contain about 525,000 cu. yds. The elevation of the base of the dam is 8,317 feet above sea level, the slope on water face will be 3 to 1 and on down stream slope 2 to 1. The Sanchez dike will be built across a low swale in the rim of the basin and will be 4,000 ft. long, 30 ft. maximum height and contain about 290,000 cu. yds. of earth; the slopes will be the same as for the dam. The Culebra-Sanchez Canal, which will act as the feeder for the Sanchez Reservoir is eight miles long and has a carrying capacity of 606 cu. ft. of water per second of time. The Sanchez Reservoir has a capacity of 104,000 acre feet and will be five miles long and two miles wide at the high water line. The reservoir is located seven miles south of San Luis, Colo., or 23 miles south of Garland, Colo., which latter town is located on the Denver and Rio Grande R. R. The San Luis Southern Ry., of which Mr. L. D. Blauvelt, M. Am. Soc. C. E., is Chief Engineer, is a subsidiary holding of the Costilla Estates Dev. Co. The railway has been built from Blanca on the D. & R. G. R. R. to San Acacio, a town on the Estates Co.'s property 16 miles distant, and will be extended to the state line during the coming summer. The outlet works of the Sanchez Reservoir consists of a reinforced concrete valve tower 15 ft. inside diameter, 135 ft. high and connected with top of dam by a 300 ft. steel foot bridge; the tower wall contains 11 inlet valves, having a combined capacity of 750 cu. ft. per second; from the base of the tower will extend a reinforced concrete conduit having 60 sq. ft. cross section area, 600 ft. long and a carrying capacity of 750 cu. ft. per second, the water from the reservoir will be drawn



Over 40 years building Contractors' Tents, Tarpaulins and Canvas Goods of Every Kind

Stable Tent **30 x 49** 10 oz. army duck, roped on ridge, eaves, across bottom of gables and every seven feet over top with 6 foot detachable 10 oz. S. F. walls and poles for **$160.00** net. First-class in every respect. Other sizes and weights in same proportion. *Write for Catalogue.*

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

through this conduit and be carried in the natural channels of Ventero Creek and the Culebra River for a distance of 10 miles to the main headgates of the diversion canals which carry the waters to a series of storage reservoirs from which waters for irrigation purposes are drawn as needed. The officers of the Costilla Estates Development Co. are: Hon. Franklin E. Brooks of Colorado Springs, President; Mr. Gerald Hughes of Denver, Vice-President and Treas.; Mr. H. Alexander Smith of Colorado Springs, Secretary; Mr. O. V. P. Stout of Lincoln, Neb., Consulting Engr., and Mr. W. D. Waltman, Assoc. M. Am. Soc. C. E., Resident Engineer in charge of work.

MINNESOTA.

Bids are being asked by Samuel G. Iverson, state auditor, St. Paul, Minn., until 2 p. m., April 15, for constructing two drainage ditches suitable for dredge work. These ditches are No. 89, located in St. Louis county, Minn., 112,757 cu. yds., and Ditch No. 93, located in Aitkin county, 65,509 cu. yds.

The Minnesota River Improvement & Power Co., a corporation with a capital stock of $1,000,000 and power to incur an indebtedness of $1,000,000, has just perfected its organization and is actively at work selling stock. The company is composed of the people along Big Stone and Traverse lakes and the Minnesota river. The company proposes to dike Big Stone lake and turn the Whetstone river above the dike into the lake and make a reservoir out of it; also to construct two other reservoirs between Big Stone lake and the Mississippi river for the purpose of preventing the overflow of the Minnesota River valley in times of high water and at the same time to utilize the water at the dams for power and light purposes. The company expects to construct a dam at Big Stone lake and install a power plant; also to improve the power at Granite falls this season. A. B. Kaercher, Room 3, Old Capitol Bldg., St. Paul, Minn., is president.

NEW YORK.

No bids were received Mar 29 by Col. W. M. Black, U. S. Engineers, New York city, for dredging in Patchogue river, Great South bay, N. Y., and Brown's creek, N. Y.

OKLAHOMA.

C. Lincoln McGuire, Davis, Okla., owning gas ground and zinc ground, 17 miles apart, desires to get these tracts connected with an 8-in. gas main and equipped with drilling rigs, mine hoisting machinery and mills, glass works and zinc smelters.

OREGON.

The Eastern Oregon Irrigation Co., controlling 30,000 acres of fruit land in Baker county, Oregon, is at the present time adjusting preliminary matters, and it is hoped that they will soon be shaped up so that work on the proposed diversion dam and the upper part of the main canal system can be started late in the coming summer. E. M. Blake, 301 Overland Bldg., Boise, Idaho, is general manager.

WISCONSIN.

Pastoret & Lawrence Co., Duluth, Minn., has been awarded a contract for constructing about six miles of drainage work near Rice Lake, Wis., the contract price being $53,458.

The Louisville Ry. Co. of Louisville, Ky., has decided to have work started on an extension of its Fern Creek interurban line from Fern Creke to Mt. Washington, Ky., a distance of eight miles.

The City Council of New Orleans, La., has adopted an ordinance providing for the sale of an electric railroad franchise from the head of Morgan and Patterson Sts., in Algiers, to a point on the Mississippi River below the city.

The work of grading and ballasting the Louisiana Railway and Navigation Co. tracks between New Orleans, La., and Baton Rouge is being rapidly pushed, and it is expected that the tracks will be in first class condition by the early summer, when the Frisco proposes to inaugurate its Mexican service. Much of the work has already been done, and loads of gravel are being rushed from the Gravel beds owned by President Edenborn, to be used on the tracks.

The Rockfish Valley Railroad Co. of Lynchburg, Va., recently chartered, proposes to build a line 15 miles long in Nelson and Albemarle counties from a point on the Southern Ry. between Elmer and Covesville to Nelly's Ford. The incorporators are Sedgwick Kistler, president; W. O. Bentley, vice-president, both of Lock Haven, Pa.; J. T. Coleman, Jr., secretary, Lynchburg, Va.; J. M. Beck, treasurer, Boston, Mass.; Wilson Kistler, Lock Haven, and J. D. Easely, Lynchburg.

Chicago, New Orleans & Improvement Co., recently incorporated with a capital stock of $60,000, will reclaim about 7,000 acres of marsh land by building a main levee, constructing dams and canals and installing pumping plant. The estimated cost of the improvement is $150,000. Nelson A. Baker, New Orleans, La., is vice-president, and Richard Fitzgerald, Chicago, Ill., is president.

Construction work has been started on the extension of the Kentucky Highlands R. R. from a point near Taylor's Distillery to Versailles. M. M. Wheeler, Central City, Ky., is treasurer and chief engineer of the company.

Reports from Norfolk, Va., state that the Harris Construction Co., Damascus, Va., has been awarded the contract by Wilton E. Mingea, Abingdon, Va., president of the Virginia-Carolina R. R., for the construction of that line from Abingdon to Jefferson. As projected the line will run from Abingdon, via Jefferson, Ashe County, N. C., to Wilkesboro, in that state, forming a new feeder for the Southern Rys. and the Seaboard Air Line.

The complete grading outfit of L. J. Smith Contracting Co. has arrived at Flagstaff, Ariz., and work on the Santa Fe between Flagstaff and Williams will be started at once. According to the contract, the job will be completed by December, 1910.

Surveys are now under way for the construction of a railroad from Saltville, Va., in Washington County, to Moccasin Gap, on the Virginia-Tennessee state line at the junction of the Holston River and the Virginia & Southwestern R. R.

The Lexington & Eastern Ry., according to reports, is planning the extension of its line from Jackson up the north fork of the Kentucky River to the mouth of Quicksand Creek, several miles east of Jackson, Ky., to connect with a narrow gage line under construction by the Stevenson Lumber Co. from their timber land in the upper end of the county to the mouth of Quicksand. John Marston, Jr., Lexington, Ky., is chief engineer of the L. & E. Ry.

The Juniata Valley Construction Co. has been incorporated in New Jersey with a capital stock of $100,000 and proposes to engage in general contracting business. The incorporators of the company are A. J. Starr, H. E. Steel, S. W. Fisher, B. T. Goddard and Howard and E. Truax.

The following is a brief summary of the present status of new railroad construction in North Dakota. Minneapolis, St. Paul & Sault Ste. Marie—Plaza to Williston, 105 miles, survey completed; Courtney to Washburn, 112 miles, survey completed; Grand Forks to Courtney 91 miles, survey supposedly under way at the present time. Chicago, Milwaukee & St. Paul—Harlem to Valley City, 56 miles, survey completed; McLoughlin, S. D., to New England, N. D., 147 miles, grading practically completed. Northern Pacific—Mandan to Stanton, 56 miles, already graded and ready for steel; Mandan to Fort Yates, 78 miles, already graded and ready for steel; Cannon Ball to the western boundary line, 168 miles, partially surveyed; Edgeley to Emmonsburg, 90 miles, all surveyed; Sanborn to Sanger, 147 miles, survey completed; Oakes Junction to Gwinner, 27 miles, survey completed. Great Northern—Fargo to Surrey, 260 miles, survey completed and contract let for grading; Stanley to western boundary of state, 84 miles, survey completed and grading partially finished.

The Nebraska Transportation Co. of Omaha, Neb., which proposes the construction of an interurban line from Omaha to Fremont, Neb., has secured options on 85 per cent of the necessary right of way between those two cities.

The commissioners of Iredell County, North Carolina, have authorized an issue of $50,000 of 30-year 5 per cent bonds, and have placed them with the Statesville Air Line R. R. Co. This is under a subscription of Statesville township, which voted the bonds in aid of the railroad which is to be built from Statesville to Mount Airy, N. C., 64 miles, via Turnersburg, Harmony, Houstonville, Yadkinville, Boonville and Dobson. W. B. Turner, Statesville, N. C., is President.

The officials of the Delaware, Lackawanna & Western R. R. received permission from the authorities of Catasauqua, Pa., to construct a line into that place. G. J. Ray, Hoboken, N. J., is chief engineer.

The State Assembly of New Jersey has passed a bill to revive the charter on the State Line Trolley Co., which proposed to build a line from Paterson north to Ridgewood. The bill permits the State Line Traction Co. to operate a line from Paterson to Ridgewood in Bergen County via Hawthorne and Midland Park. Preston Stevenson of Paterson, N. J., is interested.

The Grand Trunk Ry., H. G. Kelley, chief engineer, Montreal, Que., will start definite location surveys for its projected extension of the Central Vermont Ry. into Providence, R. I. as soon as the Rhode Island legislature grants the charter now before that body. It seems very likely that the legislature will grant the charter and Mr. Kelley has been ordered to Providence to be in readiness to start the surveys.

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Alabama Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The Alabama City, Gadsden & Attalla Street Ry. Co. is to at once start in on building a one-mile extension at North Gadsden, Ala.

Eastern capital is reported to be interested in a project for the construction of an electric railway from Florence to Huntsville. The proposed route is from Florence to St. Florian, via Bailey Spring, Killen, Crossroads, Rogersville, Athens, on to Huntsville. Surveys have not been made as yet. Thurston H. Allen, Florence, Ala., is interested.

The Birmingham & Atlantic R. R. has location surveys under way for a line from Anniston to Montgomery. The plan proposes using the 23 miles of line already in operation as a link. S. C. Oliver, Talladega, Ala., is superintendent.

Arkansas Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

Citizens of Rogers have about raised the necessary sum to secure the construction of the projected interurban line from Rogers, Ark., to Decatur by way of Bentonville. This is the project promoted by J. D. Houseman and G. G. Southerland, of St. Louis, Mo.

As proposed the line will extend west from Rogers to Decatur, a small town 28 miles distant on the Kansas City Southern, with a spur track running from the main line into Bentonville.

The Arkansas State Board of Railway Incorporation has granted the Gulf, Magnolia & Northern Ry. Co. an extension of 18 months time to complete the proposed line from Magnolia, in Columbia County, westward through Waldo to Hope, in Hempstead County, a total distance of about 35 miles. S. Q. Sevier is President of the company.

The Rock Island, Arkansas & Louisiana R. R. Co., has filed a certificate with the secretary of state, increasing its capital stock from $15,660,000 to $30,000,000.

California Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

Preliminary surveys are to be made for the extension of the Petaluma & Santa Rosa electric railway from Graton in Green Valley to Guerneyville, and also for a branch line to Camp Meeker.

Advices from Chico quote Almon E. Smith, president of the Butte-Magalia Consolidated Mines Co., as stating that tunnel 3,500 ft. long, which will connect the Mammoth Channel with Feather River, will soon be under construction.

The San Joaquin Light & Power Co., a subsidiary of Huntington's Pacific Light & Power Company of Los Angeles, will at once begin the expenditure of $1,250,000 on a plant on the north fork of the San Joaquin river, near Fresno, where a minor plant has been in operation several weeks. The larger plant will develop 22,000 HP. and supply light and energy to Fresno, Madera, Fowler, Hanford, Selma and as far south as Coalinga and the adjacent oil fields. The immediate work involves the construction of a dam 125 ft. high, behind which will form a deep lake 16 miles in circumference.

City Engineer Turner of Oakland has about completed plans for the wharf-wall to be built in the estuary from Broadway to Myrtle St., at Oakland. This is part of the proposed extensive harbor improvement for Oakland. Col. W. H. Heuer, U. S. Engineer, retired, has been retained as Consulting Engineer for the work.

It is reported here in San Diego that the Atchison, Topeka & Santa Fe Ry. will abandon its plan to enter San Diego by means of the proposed Soledad tunnel and instead will build a new line from Del Mar to La Jolla and from La Jolla to the mine now used, thus avoiding the long climb over the hills and shortening the running time one hour. It is believed that the cost of constructing the line will be reduced 60 per cent by the change.

Colorado Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The Wilcoxson-Wogan Construction Co. of Denver and has the contract for constructing the large reservoir in the San Luis Valley for the Costilla Development Co. The work will cost about $500,000, it is said.

Work has been resumed on the concrete work of the Barker Meadow dam, which is being built by the Central Colorado Power Co. near Nederland. The concrete work was suspended last fall on account of freezing weather when the dam had reached a height of 100 ft.

The Clay Creek Reservoir & Irrigation Co. has been incorporated with a capital stock of $240,000, the incorporators being J. M. Wright, E. C. Pike and C. M. Scott of Lamar.

Residents of Trinidad have organized a company to build a railroad connecting that city with the San Luis Valley. The plan is to extend the Colorado & Wyoming Ry., a coal and timber road, from Tercio, 35 miles west of Trinidad, into Antonito. This would require the construction of about 75 miles of new track. R. M. Hosea, Pueblo, Colo., is chief engineer of the Colorado & Wyoming Ry.

Surveys have been made for the power transmission line which the Glenwood Light & Water Co. will soon build from Shoshone, connecting its own power station in Glenwood with the plant of the Central Colorado Power Co. at Shoshone. W. L. Reynolds, C. E., Denver, was in charge of the surveys.

The Elk River Anthracite Ry. Co. of Steamboat Springs has been incorporated with a capital stock of $50,000, the incorporators being Arthur L. Wessels, Alden V. Wessels and C. E. Bivens.

A. M. De Remer and John Olson of Denver have been awarded the contract for repairing the break in the dam of the Julesburg reservoir and for rebuilding the 2½ miles of railroad track washed out by the flood. It will cost $75,000 to rebuild the 250 ft. of dam and $25,000 to replace the railroad bed. The washout occurred because water leaked through a natural formation of gypsum rock underlying the dam.

James D. Schuyler, consulting engineer, Los Angeles, Cal., who has been investigating the Colt canal and Lake Meredith reservoir projects, has advised the Arkansas Valley Ditch Association to take immediate steps to acquire and carry through the project.

The Omer Irrigation District has employed Field, Fellows & Hindelider, consulting engineers, Denver, Colo., to draw plans and specifications for a dam across the Apishapa River, near the mouth of Gyp Creek, 20 miles south of Fowler, in the Omer country. At a point conveniently near a large natural reservoir the dam will be built across the deep canon and will be 60 ft. high and possibly 70. The dam extending across the canon will be from 600 to 700 ft. across at its topmost point. When the estimated cost of this work is obtained a meeting will be held at which the holders of land in the Omer district will confer with the owners of the Omer canal and arrange for the purchase of this ditch by the Omer irrigation district. The ditch is 16 miles long and there are 10,000 acres of land under it.

It is now reported that the Rock Island system is behind the Denver & Gulf R. R., and will finance the construction of that line from Dallas northwest to Denver and Colorado Springs, Colo. The object in constructing the Denver & Gulf is not only to get a direct route from the Gulf coast to the proposed outlet of the Rock Island to the Pacific Coast, but to put the Rock Island in a position to make important connections for the Northwest. The Denver & Gulf was chartered recently in Colorado, Texas and Oklahoma to build across the Panhandle country of Oklahoma from Texhoma northwest to the Colorado state line. Construction is now said to be in progress near Texhoma and contracts have been entered into with cities along the proposed line.

The Brighton Gardens Reservoir & Land Co. of Brighton has been incorporated with a capital stock of $11,000, the incorporators being D. F. Carmichael, W. G. Lovelace, and B. J. Prendergast.

Attorneys of the Southern Pacific R. R. have secured right of way for the road and depot grounds and an early commencement of construction on the proposed line from Gallup to Farmington, Colo., is expected.

The Denver, Laramie & Northwestern Ry. is actively engaged in securing right of way along the Box Elder Valley from Wellington, Colo., and through the Virginia Dale Country.

Charles Cole and James Counter of Brighton are to construct the Laramie seepage and drainage ditches, which will irrigate 13,150 acres in Weld and Adams counties. The source of supply is from the Brighton and certain sloughs and marshes in that vicinity. The work will cost about $26,000.

The Paradox-Pacific Construction Co. has been formed, its primary object being the construction of the Paradox Valley railroad, which is designed to afford an outlet for the products of 300,000 acres of the most fertile land in southern Montrose and northern San Miguel counties. The incorporators of the company are Carmon Layton of Montrose, who has been working for more than two years on the plans for the railroad; Fred L. Lucas, vice president and general manager of the Denver Reservoir Irrigation Co., and Samuel Brown, Jr., and Jamot Brown, principal promoters of the Colorado & Southern Irrigation Co. The Layton Engineering Co. of Montrose will begin at once making the final locations for the road. The line has already been surveyed and the general route located, but several minor changes probably will be made before the route is finally approved. The road will be, as now planned, about 105 miles in length. It will join the Denver & Rio Grande either at Montrose, according to the original plans, or at Colona, about eight miles farther south. It will then make a broad detour to the southward, reaching some of the fertile mesas of northern San Miguel county, will pass through the towns of Norwood and Shenandoah, over the Sage flats, and thence up Dry Creek valley to Paradox.

Georgia Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

It now looks as though construction work would be started early this month on the projected electric railway of the Atlanta & Northeastern R. R. from Atlanta to Cumming and the Creighton mines. As proposed there will be one line to Alpharetta, at which point two lines will diverge, one going to Cumming and the other to Creighton, a distance of 42 miles and 18 miles respectively. The road will follow the course of Peachtree road to Roswell. The incorporators of the company include J. P. Brooks of Alpharetta, R. P. Jones, J. L. Murphy, J. I. Tinsley, C. L. Harris, F. Carter Tate, and W. R. Ottwell.

The Waycross & Florida Central R. R. Co. has applied to the secretary of state for a charter providing for the construction of a line from Waycross, Ga., to Lake City, Fla., a distance of more than 70 miles. The headquarters of the company will be at Waycross, Ga., and the incorporators are C. J. Haden, C. H. Johnson, Charles E. Johnson, W. C. Dod-

son, E. S. Lewis, C. R. McCormack, Atlanta, Ga.; J. S. Blalock, Jonesboro; R. W. Nelson, Jersey City; George W. Deen, W. E. Sirmans, Waycross, Ga.

The Atlanta, Georgia Railway & Electric Co. has applied to the city council of Atlanta for permission to construct lines of electric railway along the following routes in the city of Atlanta: Along Ormond St. from Pulliam St. to Washington St.; along Washington St. from Ormond St. to Jefferson St., thence along Jefferson St. to Crew St.

The Augusta, Ga., and Columbia, S. C. Chambers of Commerce are to take up the matter of having the Atlantic Coast Line Ry. Co. extend its line from Ehrahardt to Denmark or Bamberg. E. B. Pleasants, Wilmington, N. C., is Chief Engineer of the company.

Idaho Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The Utah Construction Co., Ogden, Utah, has work under way on double tracking the Oregon Short Line in Port Neub Canyon between McCammon and Inkum, Idaho.

The Salt Lake-Idaho R. R. Co., an Oregon Short Line project, has filed its articles of incorporation at Boise. The company proposes to build a line from Saline, on the Lucin cutoff, north through Kelton, and pass down Raft River Valley to Minidoka, Ida. This line would connect the Southern Pacific, the Minidoka & Southwestern and the Oregon Short Line through the Twin Falls district. The total length of the new road is estimated at 150 miles. The capital stock of the company is fixed at $160,000, of which W. H. Bancroft, general manager, Oregon Short Line, Salt Lake City, Utah, subscribed the major part as trustee, while J. M. Davis, D. E. Burley, P. L. Williams, and F. H. Knickerbocker each hold one share as an incorporator.

Harold Caldwell, city engineer of Boise, has started preliminary surveys for an electric railway from Caldwell to Roswell.

The Southern Idaho Reclamation Co. of Mountainhome has filed plats for right of way for the pipe line and reservoir. The latter will have a capacity of 313,332 acre feet.

The Idaho Northern R. R. has had two surveys made for its proposed extension from Emmett, the present terminus, to Smith's Ferry, a distance of 70 miles. Two plats of the survey have been filed and it is believed that construction work will be started this spring. E. P. Spalding, Wallace, Idaho, is general manager.

The Commercial Club of Coeur d'Alene is advocating the construction of a street car line from Post Falls to Dalton Gardens.

Information has been received in Boise, Ida., to the effect that surveys are now being rushed to completion and construction work will be started on the proposed western branch of the Gilmore & Pittsburg R. R. about June 1.

Illinois Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

Yoder & Schwartz have commenced work on their contract for constructing a 33 mile canal that is to drain the swamp land near Libertyville and near Roundout, along the Chicago, Milwaukee & St. Paul R. R. This district is generally known as Skokie swamp. About 6,000 acres will be drained.

The Chicago & Eastern Illinois R. R. is said to be planning to build a short spur at Alton to cost about $29,000, by which it will gain an entrance to this city over the Illinois Terminal R. R.

The Baltimore & Ohio R. R., which recently took over the Chicago Terminal Transfer R. R., property at Chicago, is contemplating making many improvements to the property. The plans which are being worked out are said to contemplate the ultimate expenditure of several million dollars, one million dollars having been set aside for track elevation during the present year.

The directors of the Atchison, Topeka & Santa Fe Ry. have authorized an issue of $43,686,000 50-year 4 per cent convertible bonds to enlarge the capacity of the lines now in operation.

The East Side Levee Sanitary District, Henry D. Sexton, President, Sexton bldg., East St. Louis, is stated to be calling for bids on excavating the diversion channel for Cahokia Creek. This channel will start at the junction of Cahokia and Indian creeks, west of Edwardsville, and ten miles north of East St. Louis. It will be 4½ miles long and to construct it will require moving 1,500,000 cubic yards of dirt at an estimated cost of $800,000.

Announcements have been made, it is said, that the Illinois Central R. R. Co. has decided to lay double track on its line from Freeport to Chicago, Ill. The work according to measurements will include about 115 miles of track. H. R. Safford, Chicago, Ill., is Chief Engineer Maintenance of Way.

It is reported that the Cleveland, Cincinnati, Chicago & St. Louis Ry. has awarded contracts for the construction of 20 miles of line from Stonefort, Ill., to Metropolis, Ill. George P. Smith, Cincinnati, O., is Chief Engineer of the C. C. C. & St. L. Ry.

According to reports from Harrisburg, Ill., the Oil & Coal Belt Ry. Co., recently organized to construct a line from Terre Haute, Ind., to Cairo, Ill., has secured an option on the uncompleted Galatia, Harrisburg & Southeastern Ry. A. G. Russell, Chicago, Ill., is Chief Engineer of the O. & C. B. Ry. Co.

The Marion Ry. Co. with principal office at Marion, has been incorporated with a capital stock of $10,000, and will construct a line from a point on the Herrin & Southern Co.'s line of railroad, now in process of construction, about three miles southwest of Marion, Ill., to and through the City of Marion and thence in a northerly direction to the City of Johnston City, all in Williamston county, Illinois. The incorporators and first board of directors are A. E. Harper, William Duff Haynie, E. J. Hughes, L. D. Doty and C. A. Rickett, all of Chicago, Ill.

Indiana Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The Wabash R. R. and Pennsylvania R. R. have begun work on their track elevation work at Fort Wayne. J. S. Danes is in charge of the Wabash work and Fred Graham, division engineer, is in charge of the Pennsylvania work. The city's portion will be done by Trippeer & Sons, Peru, Ind.

The New York Central Lines are reported to have decided to establish at Gibson, near Hammond, an operating center for all its lines in the Chicago district. The plan contemplates the expenditure of about $20,000,000 for improvements to the system. The chief of these will be the double tracking of the Chicago, Indiana & Southern R. R. all of the way from Indiana Harbor to Danville. This will cost over a million dollars in itself and will open up a north and south railroad system between Indiana Harbor and New Orleans.

The Pennsylvania R. R. is said to be planning to build an extension north in order to compete with the Big Four at Evansville. The latter railroad has just awarded contracts for building an extension to Mount Carmel.

The Burns Construction Co., Isabella Bldg., Chicago, Ill., which is to build a traction line from Indianapolis to Washington and on to Evansville, has purchased of Ziba Graham the Washington Street Ry., which it will operate in conjunction with the proposed interurban line.

Iowa Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The Ottumwa Railway & Light Co. of Ottumwa, which is controlled by H. M. Byllesby & Co. of Chicago, is planning the extension of the Ward St. line out Chester Ave. to Wapello St. and the addition of a half mile more line on the Sheridan Ave. route in Ottumwa.

Grading work on the Iowa & Omaha Short Line Ry. is well under way and the contractor, William Lane, has established one grading camp and expects shortly to have another in operation, with the idea that the road bed will be ready for the track by July. By that time the full complement of track material will be on hand. Bridge work will probably be done as the track is laid in order that material may be hauled by train to the places where it is to be used.

The Chicago & Northwestern Ry., R. W. Richardson, division engineer, Sioux City, is to double the capacity of its yards at Sioux City and is planning to have the work started in May.

The commissioners of Crawford county, at Denison, and the Harrison county commissioners are taking steps for securing a new channel for the Boyer River. About 18 miles of new channel come in Crawford county.

John McAndrews, Kankakee, Ill., has been awarded the contract for straightening the Ocheydan River through a part of Clay County. The river's course, which now is about 48 miles in length, will by ditch be made into 11.55 miles.

The directors of the Des Moines & Sioux City R. R. Co., which is projecting an electric railroad to connect Des Moines, Sioux City and Fort Dodge, have signed a contract with the American Engineering Co. of Indianapolis, which made the survey, permitting this company to dispose of the entire bond issue of $8,000,000 at 81 cents. When the bonds are placed, the board of directors agree to give bond in the sum of $10,000 to provide the right of way. Already about 65 miles of the total distance, 218 miles, has been given, gratis. The company holds option on about 60 miles of the balance.

The Rundell Land & Improvement Co., of Iowa City, proposes to construct an electric street railway in that city.

The Citizens' Railway & Light Co., of Muscatine, has increased its capital stock from $750,000 to $1,500,000.

Kansas Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

The McKinley syndicate has purchased the property of the Topeka Electric Ry. Co. at Topeka.

The Motor Grand Traction Co. of Belleville, Kas., which proposes the construction of a motor car line from Chester, Neb., to Wichita, has started preliminary surveys from Canton to Roxbury and from Canton to Goerrel. E. S. McNutt, Belleville, is interested.

An ordinance is to come before the city council of Kansas City asking the Metropolitan Street Railway Co. to build a car line on 18th St. from Central to Minnesota Aves. in that city.

The Wichita Railway & Light Co. of Wichita has ordered 1,000 tons of steel to be used in improvements at Wichita, to include a double track on South Main St.

The Union Pacific R. R. proposes to ballast 220 miles of its branch lines in Kansas this year.

The Kearney & Beloit Ry. Co. of Kearney is reported to have secured capital in England to the extent of $5,000,000 for the building of the project. Permanent surveys for the line are about completed.

The Oswego, Columbus & Cherryvale Electric Ry. Co., capitalized at $50,000, and with headquarters at Oswego, has been chartered. The company proposes to build a road from Columbus to Cherryvale, 47 miles. The incorporators are S. B. Miller, Oswego; D. Christman, W. J. Jones and G. Torbert, Altamont; I. M. Hinds, Mound Valley; David Dunbar, Hallowell; C. A. Mitchell, Cherryvale, and T. F. Stice, Oswego.

Michigan Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

Work has been started on the extension of the Coloma-Benton Harbor interurban line into Coloma. As soon as the grading and track construction work of the extension has been completed the working force will be greatly increased and operations for electrifying the Paw Paw Lake branch will be commenced.

Hoose & Person, Iron Mountain, have been awarded a contract by the Rogers-Brown Ore Co. for stripping with steam shovels about 150,000 cu. yds. of overburden at the Portland

mine, at the western end of the Marquette range. In addition to the stripping the company has arranged for the mining of 250,000 tons of ore. The overburden is shallow. Hoose & Person are completing the work of stripping 50,000 cu. yds. of surface material from the Antoine Ore Co.'s Traders mine, Menominee range. Another steam shovel has been added to the firm's equipment.

The Cummer-Diggins Co., Cadillac, according to reports, is to extend its present logging railway running through Selma township in section 7.

According to reports the work on the roadbed of the Detroit, Bay City & Western R. R. is steadily progressing. Trestle has been completed over the Quanicassee River and the grading crew is heading eastward. Handy Bros., Bay City, Mich., are constructing the line.

Citizens along the proposed right of way are to petition the Grand Trunk Ry. Co. to extend its tracks through Ashley to Saginaw, Mich. The Board of Commerce of the latter city is at the head of the movement.

Minnesota Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

A resolution is before the city council of Minneapolis asking the Twin City Rapid Transit Co. to extend the Chicago Ave. line into the Lake Amelia district.

Castle Brothers of Crookston have been awarded the contract of stripping the Great Northern Ry. gravel pits at Bagley and Downer, the former on the Cass Lake line and the latter on the main line to St. Paul. Several work trains will be put on in the near future and the work of ballasting the tracks for the season will be started. The entire track from Crookston to Duluth will be ballasted.

The Hanna Coal Co. will spend about $300,000 this year for the erection of a new dock at Duluth.

The Zenith Furnace Co. is planning to extend its Duluth dock 600 ft. and greatly increase its capacity. New rigging will be installed and other improvements will be made.

A. Guthrie & Co., St. Paul, Minn., have the contract for constructing the Great Northern line from Fargo, N. Dak., to Surrey, N. Dak. The contract is said to call for 225 miles of grading.

V. T. Reilley, Omaha, Neb., who has a contract for grading for the new railroad track along the bluffs east and north of Watson, has established a camp at Milan. Mike McGlenn and John Carson, Omaha, Neb., have sub contracts on the work.

Construction work on the Thief River Falls Division of the Soo has been resumed all along the line. C. E. Jamieson is working on a six-mile contract near Schley. Richard Evans of Minneapolis has the contract for 17 miles of grading between the "narrows" at Cass Lake to the Mississippi River in the city limits of Bemidji. He has a large force at work. John Moberg of Bemidji has the contract for grading eight miles from the Mississippi River at Bemidji to a point one mile west of Wilton. The contracts held by Evans and Moberg call for the completion of their grades ready for the steel not later than June 30. The greater part of the right of way will be ready for steel July 1, but some will not be graded until August 1.

Work has been resumed laying 90-lb. steel on the Duluth-Staples line of the Northern Pacific Ry. Ballasting and laying steel on the road between Deerwood and Brainard, Minn., will also be rushed to completion.

The Chicago, Milwaukee & St. Paul Ry. Co. is making rapid progress on the double track work between Richmond and Wabasha, Minn. The company has acquired a 10-acre sand pit near Minnesota City from which it will secure ballast for the line.

The Barnett & Record Co. of Duluth, has begun work on its contract for pile driving and making the concrete piers and cribs for the Pittsburg Coal Co.'s dock at Duluth. The Brown Hoist & Machinery Co. of Chicago will furnish the bridge work and the machinery for the dock, and the Great Lakes Dredge & Dock Co. will do the filling. When complete the dock will be 2,200 ft. long and 800 ft. wide.

The Twin City Rapid Transit Co., of St. Paul, is reported to be planning track building in St. Paul that will give Minneapolis a direct line to Stillwater. At present Minneapolis passengers for Stillwater must transfer in St. Paul. The new line will be laid on Maryland St., from Lake Como to some point south of Lake Phalen, to Hazel Ave., connecting with the present Wildwood-Stillwater line.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Monarch Construction Co. has been incorporated with a capital stock of $10,000, of which all has been paid in. The headquarters of the company, which proposes to engage in general railroad construction business, will be 316 Liggett Bldg., St. Louis, Mo. The incorporators are William Buck, Philip A. McDermott, Louis W. Kieburtz and Thomas H. Sprink.

Although no definite statements have been made, it has been reported here in St. Louis that the St. Louis, Iron Mountain & Southern R. R. Co. is considering the construction of a cutoff from Greenwood to Pike City to shorten the main line between Kansas grain fields and New Orleans, La. E. F. Mitchell, St. Louis, Mo., is Chief Engineer of the company.

Citizens of Bethel, Mo., have raised half the amount necessary to secure the construction of the extension of the Shelbyville R. R. to that place, a distance of 8 miles.

The reported acquirement by George D. Rosenthal of St. Louis of the controlling interest in the toll highway bridge over the Missouri river at Jefferson City is believed to be one of the final steps preliminary to the construction of an interurban line across the state. Mr. Rosenthal is interested in the construction of the proposed interurban line connecting St. Louis and Kansas City and it is thought that the line will be built into Jefferson City over the new bridge.

St. Louis Items.

BY A. B. KOENIG.

The L. J. Smith Construction Co., 1111 Commerce Bldg., Kansas City, Mo., has some fine steam shovel and rock work to let on the Santa Fe R. R. in Arizona. Free transportation from points west of Kansas City.

The Morey-Falhaber Construction Co., 1212 Chemical Bldg., St. Louis, Mo., has a lot of soft sand stone, loose rock and earth work on the Santa Fe R. R., near Lameta, Texas, to sublet. Write the company to Lameta, Tex.

The Walsh Construction Co. has 400,000 yds. of good side borrow work on the Big Four R. R. in southern Illinois and Indiana to let. In reference to this work write the company to St. George hotel, Evansville, Ind.

Costello Bros. secured 50 miles of betterment work from the Big Four R. R. between Indianapolis and Muncie, Ind. This is good scraper and machine work. They will sublet this in quantities to suit outfits and have opened an office in the Claypool Bldg., Indianapolis, Ind.

Wm. O'Connor is in town idle at present.

F. M. Skene is getting ready to begin on his concrete work on the Big Four R. R. in southern Indiana.

We welcome to the contracting fraternity Wm. Hughes, who begins on his first concrete contract on the Big Four R. R. between Mt. Carmel and Evansville, Ind. We wish you success, Hughes.

Keating Bros. have taken 150,000 yds. of work from the Walsh Construction Co. on the Big Four R. R. in southern Illinois and Indiana.

Henry Schweizer is in here looking for some new work for his team outfit.

Montana Notes.

FROM CORRESPONDENCE AND OTHER SOURCES.

W. H. Smead has made a proposition to the Chamber of Commerce of Missoula, Mont., for the construction of an electric railway from Missoula to Polson on the Flathead reservation. As projected the line would be about 75 miles long. The Chamber of Commerce appointed a committee to take up the matter.

Preliminary surveys are now under way for the projected line of the recently incorporated Virginia City Southern Electric Ry. Co. of Virginia City. This company plans to build a line from Lyon in the Madison Valley via Ennis and Virginia City to Alder. The incorporators of the company are Luther H. Leber of New York city, W. A. Clark, A. J. Bennett, Karl Elling, and George Ed. Gohn of Virginia City. Mr. Leber is already engaged in building an electric railroad from Kenyon City to Cooke City.

The Northern Pacific Ry. is reported to have found a feasible route for an extension of the Staples Division from the terminus at Oakes, N. Dak., through to Forsythe, Mont. The proposed route west would take the road across country to Edgeley, in LaMoure county, N. Dak. From there the route west would be through southern Logan, central Emmons, southern Morton, southern Hettinger, southern Billings and connect with the main line of the Northern Pacific at Forsythe, Mont.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

I. A. Hodge & Co. are making good progress with the excavation work for their barge canal contract near Mechanicville. On March 23, with two "dummy" engines taking care of the cars, Steam Shovel Engineer William Hinghouse loaded 210 4-yd. cars in 205 minutes. The next day in eight hours 425 cars were taken out, an average of nearly a car a minute. S. W. Andrews is superintendent for the contractors.

A bill is before the state legislature appropriating $25,000 for the Superintendent of Public Works, Albany, to dredge the outlet of Keuka lake from the lake to the steamboat docks in the village of Penn Yan and to widen and deepen the channel.

Bids were opened March 29 by the State Superintendent of Public Works, at Albany, for several barge canal contracts, the low bidders being as follows: Contract 21, three miles in extent, just west of Genesse River, Lane Bros. & Co., of Altavista, Va., $1,323,150; contract 39, dredging of Oswego River between Three Rivers and Fulton, James Stewart & Co., of New York, $1,048,670; contract 78, construction of a dike on Oswego River, near Fulton, Cunningham & Woodward, of Hudson, $47,721. Bids were rejected on contract No. 73, for the dredging of the Hudson between Northumberland and Stillwater, a distance of about 15 miles, and this will be readvertised.

The Southwestern New York Traction Co., of Bolivar, N. Y., has been incorporated with a capital stock of $200,000, the incorporators being C. M. Van Curen, A. J. Matson and J. F. Care of Bolivar.

The Genesee River cut off of the Erie R. R. is practically completed and it is believed that it will be put in operation some time in May. All that remains to be done is the removal of earth slides in two places and steam shovels are now at work doing this. The cut off will eliminate a bad grade between Hornell and Cuba and adds the third side to a triangle having Hornell, where the Buffalo division branches off from the main line, Portage on the Buffalo division and Cuba on the main line as its three points. From Hornell to Cuba there is a bad grade on the main line, which the heavily laden east bound freight trains had difficulty in negotiating. To obviate this a line 34 miles long, running southeast from Portage to Cuba, was planned at a cost of several million dollars. In building this cut off it was necessary to construct two long viaducts, one over the Genesee valley and river near Belfast, 3,120 ft. long and 145 ft. high, where it crosses the river, and the other over Rush creek, 1,920 ft. long and 150 ft. in the air. Both have been laid with a single track, but are wide enough for a second track when it becomes necessary.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The H. E. Culbertson Co., Cleveland, has started work on its contract for the extension of the ore yard of the Youngstown Sheet & Tube Co. at Youngstown. The work includes 10,000 cu. yds. of concrete, 25,000 cu. yds. of excavation and 50,000 ft. of piling.

Improvements contemplating the expenditure of $1,400,000 are proposed for the Kanawha & Michigan Ry., of which F. B. Sheldon, Columbus, is chief engineer. These improvements contemplate new trackage, tunneling, and the elimination of curves.

The Lake Shore & Michigan Southern, the Pennsylvania and Big Four have submitted a preliminary plan to the city officials of Cleveland for a new union depot to cost $2,250,000.

Lane & Co., Norfolk, Va., have begun work at South Portsmouth on their contract for double track work on the Chesapeake & Ohio between South Portsmouth and St. Paul.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Tulsa Street Ry. Co. of Tulsa is considering double tracking its line for some 13 or 14 blocks on South Main St. in Tulsa.

The Eastern Oklahoma Traction Co., recently chartered with a capital stock of $50,000, proposes the construction of a 251-mile line to Tulsa, thence to Wagoner, Sapulpa, Webers Falls, Checotah, Okmulgee, and Oklahoma City. Parties interested in the railway have incorporated the Railway Construction Co., with a capital stock of $50,000, to have charge of building the line. H. B. Spaulding, R. N. Eggleston, J. W. Maddox, L. R. Kershaw, W. L. Tull, J. B. Furry, and Roy Bowman, all of Muskogee, are interested.

The Commercial Club of Cheyenne has accepted a proposition for the construction of an electric railway to that city. The club will furnish right of way through the county and $35,000 bonus, the bonus becoming due when the road is completed into Cheyenne and passenger and freight traffic in progress. The electric line will build from Oklahoma City, Hobart, and Sayre to Cheyenne.

The Sallisaw, McAlester & Southern Ry. has started preliminary surveys under the direction of M. J. Smith for its line from Coalgate to Savanna, Okla.

Steel is on the way for the Enid, Ochiltree & Western R. R., chartered some time ago to build east from Dalhart, Tex., to Enid. From Dalhart the road will be built first to Wilcoe, it being expected to run trains over that line by July 1. From Wilcoe, construction will be extended to Ochiltree, the officials of the road intending to reach Dumas by Sept. 1.

The construction of an interurban railroad from Wilburton, Okla., to Fort Smith, Ark., is proposed by the Citizens Electric Co., of which James M. Connell, Wilburton, Okla., is President.

Grading work on the first 50 miles of grade of the Osage Western Ry. has been started at Vinita and a second contract will be let this month. The line will run through Vinita, Bartlesville, Pawhuska, Bliss, Billings and Enid. The deal for the use of the Rock Island branch from Billings into Enid has been called off and an independent line will be built. The construction of the line from Vinita to the junction of the Salt Fork and Arkansas rivers, near White Eagle, has been financed by the sale of bonds to St. Louis financiers.

M. J. Smith, Engineer, Sallisaw, McAlester & Southern R. R., with corps of surveyors, has the preliminary survey under way for the construction of the proposed line from Coalgate, Okla., to Savanna.

According to advices from Guthrie, Okla., the Osage & Western Ry. Co. has awarded the contract for grading the first 50 miles of line from Vinita westward to E. G. Spaulding. The permanent survey west of Vinita is progressing rapidly toward Pawhuska, the route west of the latter city being already located.

E. E. Poe, Comanche, Okla., representative of the Milroay Oil & Gas Co., is promoting the construction of the proposed Red River Valley & Texas R. R. Co. Commercial Clubs of the cities along the right of way are assisting in the work. As planned the line will run from Ardmore, Okla., to New Sneed, Oil City, Milroy, Loco, Comanche, Walters, Loveland, Mercer and Frederick, Okla., to Chillicothe, Tex.

Grading work for the Cherryvale, Oklahoma & Texas R. R. has been started just across the Oklahoma state line from Caney, Kas. The branch to Fayetteville, Ark., will be first built. From there the road will be constructed to Perry, Okla., and thence to El Paso, Tex. The line is expected to be completed to Wann, Okla., within four months. This is the Porter road, and S. M. Porter, Caney, Kas., is president.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Coos Bay Rapid Transit Co. has filed its articles of incorporation in the office of the secretary of state. The company proposes to build an electric railway system to include Marshfield, Empire, North Bend, and other towns on Coos Bay. The capital stock is $1,000,000 and the incorporators are L. D. Kinney, George M. Everett, and George W. Kitchen.

The Normetco Dredging Co. of Portland has been incorporated with a capital stock of $50,000, the incorporators being William A. Adams, James Steel, Frank N. Clark, and C. N. Atkinson.

Robert Wakefield of Portland, who has the contract for building the $150,000 jetty at the mouth of the Sunslaw River, has established headquarters at Florence for this work. Lumber and scows for the work have been ordered. Rock will be scowed from up the Sinslaw River and several small steamers will be employed towing them.

The Astoria, Pacific Coast & Southern Ry. Co. of Astoria has been incorporated with a capital stock of $500,000, the incorporators being B. Van Dusen, Edward E. Gray and J. E. Higgins.

The Fairdale, Trisp & Tillamook R. R. Co. has been organized with a view to furnishing a link in a railroad from Carlton on the west side line of the Southern Pacific to Tillamook. Russell Hawkins, one of the incorporators, is manager of the Whitney Co., Ltd., of Portland,, which owns large tracts of timber in Clatsop county and is now building a logging road into the timber from Blind Slough on the lower Columbia. The Fairdale-Tillamook branch will have no connection with this road. The new project will connect with a logging railroad now being built from Carlton to Fairdale by the owners of the Carlton Lumber Co.

Advices from Oregon City state that construction work will be started on the Clackamas Southern Ry. within 60 days. The right of way from Oregon City to Silverton through Beaver Creek and the Molalla Valley has been obtained and a resurvey has just been made from Inskeep's place, at Beaver Creek to Oregon City.

The Arnold Irrigation Co. is spending $35,000 on improvements to the distributing water system. The largest undertaking will be the building of a new flume 12 ft. wide and 3 ft. deep and 1¼ mile long. The body of it will be of 2-in. lumber, and the supporting timbers and foundation will be constructed in most substantial manner. The intake will be enlarged and permanent gates installed. Approximately three miles of old canal will be widened. It is planned to build from six to eight miles of new canal on the east lateral, which runs eastward into the Arnold section; and also some three or four miles of new work on the north lateral.

The Central R. R. of Oregon, R. H. England, general manager, Union, Ore., has surveys under way for an extension of the road from Union, Ore., through the Grande Ronde Valley and over the Blue Mountains to Walla Walla, Wash.

The Astoria, Pacific Coast & Southern Ry. Co. has been incorporated with a capital stock of $500,000, and proposes to construct, equip and operate an electric or steam railway between Astoria and Tillamook. The new company has been organized to succeed the Astoria, Seaside & Tillamook Ry. Co. The incorporators are B. Van Dusen, Edward E. Gray and J. E. Higgins.

The Fairdale, Trash & Tillamark Ry. Co. has been incorporated with a capital stock of $10,000 and principal office at Portland, the incorporators being Russell Hawkins, John M. Gearin and A. B. Wastell.

The U. S. Light House Department has awarded the contract for making repairs to the wharf at Tongue Point buoy station to John A. Fastabend of Astoria, at $4,397, by the Lighthouse Department.

The Pacific Diking Co. of Astoria, has been incorporated with a capital stock of $5,000, the incorporators being Charles Schwegler, Frank Behnke and William Schwegler.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Conestoga Traction Co. is making surveys toward Oxford with a view to extending its lines in that direction.

Residents of Essington have submitted a proposition to the Philadelphia Rapid Transit Co. for the extension of the Elmwood Ave. line to Essington.

Bids for the construction of the Western Maryland Ry. extension from Cumberland, Mo., to Connellsville, Pa., are reported to be in the hands of H. R. Pratt, chief engineer, Baltimore, Md. It is planned to have the work completed in two years. The improvement will require an expenditure of $12,000,000.

The supervisors of Porter Township, Schuylkill County, have granted to the Reiner City, Tower City & Johnstown Ry. Co. the right to construct a line between the towns mentioned above. The line will be operated by motors.

E. B. Smith & Co. of Philadelphia, who are largely interested in the Lehigh Valley Transit Co., are reported to have purchased the Philadelphia & Western Ry.

The United Fuel Gas Co. of Pittsburg, Pa., is said to be planning considerable additional pipe line construction in connection with recently announced acquisition of West Virginia properties of Columbia Gas & Electric Co. of Cincinnati, O. The purchase included control of 100,000 acres gas territory, 500 miles pipe line, etc.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Texas Traction Co. of Dallas has negotiations under way for taking over the Denison-Sherman interurban, thus making a continuous line between Dallas and Sherman.

Citizens of Solado are taking steps to secure an extension of the Belton-Temple Traction Co.'s line from Belton to that place, a distance of 10 miles. It is proposed to raise a bonus of $40,000 and to give free right of way.

The second grading contract for the Houston-Galveston Interurban Ry. has been let. Hartley & Ford, Bay City, secured the contract, which covers a 19-mile stretch from the end of the Kelso contract at Clear Creek to Brays Bayou, a few miles south of Houston. The work will require a large amount of culvert construction, which will be done by the contractors. The railway company has awarded the Galveston Creosoting Co. the contract for approximately 500,000 ft. of creosoted bridge timbers, enough material for the construction of 36 bridges and culverts, three of which are of considerable size. Those over Brays Bayou and at Dickinson Bayou are the largest, with the exception of the Clear Creek bridge, which will be about 700 ft. long.

The Harrison Construction Co. of San Antonio has been incorporated with a capital stock of $10,000, the incorporators being George W. Nock, W. L. Cullen, and A. L. Metlock.

The Missouri, Oklahoma & Gulf Ry., the Kenefick line, now under construction, has taken out a charter in Texas for a branch beginning at the connection with the southern extremity of the bridge to be constructed across the Red River in the northern part of

Grayson county, at a point on the boundary line of the states of Texas and Oklahoma, about seven miles east of the line extending due north from the city of Denison and running thence in a southerly and southeasterly direction for a distance of not more than ten miles. The incorporators are William Kenefick of Kansas City, E. R. Jones of Muskogee, W. P. Dewarz of Muskogee, J. T. Buckner, John T. Suggs, R. S. Legate, G. L. Blackford, Edwin Camack, Arthur Miller, and Fred Ruark, all the latter of Denison. J. J. Harrison, Calvin, Okla., is chief engineer, M., O. & G. Ry.

The city of Austin voted yesterday (April 5) on the question of accepting the proposition of the Dumont-Holmes Steel Concrete Co. of Chicago, mentioned in our last issue, to rebuild the dam across the Colorado River above the city for $1,000,000. It is believed that the proposition carried.

The Quanah, Seymour & Rockport Ry. has been formed to succeed the Quanah & Gulf Ry., and will file its charter shortly. All cities along the projected route have signed contracts and it is believed that the road will be constructed soon. L. E. Walker is president; Harry Koch, Quanah, is a director.

Surveys have been started from Coleman for the projected line of the Texas North & South Ry. One survey goes from Coleman north to Seymour and the other south to San Antonio.

Business men of Silverton and Plainview are taking steps to secure the construction of a railroad to connect the two places. The road would be about 35 miles long, and Plainview citizens have offered to give $100,000 for it.

The Fred A. Jones Co. of Dallas has begun work on its contract for the construction of the dam, spillway and foundations for the pumping station at the White Rock reservoir site for the city of Dallas. The contract price is $255,000 and the work is to be completed in 330 days. A contract for the first earthwork has been let to the Larkin Contracting Co.

C. C. Fredericks of Amarillo has submitted a proposition to the Chamber of Commerce of Denton to build a line west from the city to some undetermined point on the Santa Fe. The proposition asks for right of way, depot grounds and a $50,000 bonus.

George Byrne, Houston, has completed his contract for constructing the dam for the International & Great Northern Ry. reservoir, one mile east of Taylor.

The State Railroad Commission has ordered the secretary of state to register bonds for the Bartlett & Florence R. R. and the Roscoe, Snyder & Pacific, the former to have $116,500 in bonds on 11 miles from Bartlett to Jarrold. The latter is to register $254,500 on the extension from Snyder to Fluvanna.

Work has been started by the Wichita Falls & Northwestern Ry., now in operation from Wichita Falls, Tex., to Altus, Okla., and the construction of the line is being rapidly pushed into Elk City. Woodward is the next objective point, the intention being to build the road into Kansas, making a direct line from the Kansas wheat belt to the gulf.

According to advices from Denison, Tex., the Missouri, Kansas & Texas R. R. Co. has awarded James Stewart & Co. the contract for the construction of the company's new car shops at that place. The work is estimated to cost $100,000.

J. M. Waggstaff and W. G. Swenson of Abilene, Tex., are reported to have completed arrangements for the construction of the Texas Central line to that city. Surveys are also under way for the construction of a line from Abilene, Tex., to the coal fields in Eastland County, a distance of 40 miles. H. S. McCall, Waco, Tex., is resident engineer.

Bids for the construction of the Abilene Central R. R. between Abilene and Rising Star, Tex., are reported as being received by J. H. Waggstaff, Abilene, Tex. The work includes 56 miles of main line and 6 miles of siding and switches.

The Gainesville, Oklahoma & Western R. R. Co. of Gainesville has been chartered with a capital stock of $100,000 and proposes to build a line of railroad from Gainesville south to a connection with the Rock Island to Bridgeport, in Wise County, and from Gainesville north to the Red River at Orleans. The line will be about 80 miles long. The incorporators include J. C. Whaley, George E. N. Ball and S. M. King of Gainesville.

Porter A. Whaley, secretary of the Chamber of Commerce, Quanah, Tex., is taking up the matter with President F. A. Bourne of Ardmore, Okla., to secure the construction of the River Valley & Texas R. R. from Comanche, Okla., to Quanah.

C. D. Kiser, who has just completed the third mile on the Frisco extension, has moved to the Santa Fe two-mile contract on the Sellman ranch. Jack Collins, who has just completed a contract on the Sterling City extension out from San Angelo, has moved his outfit to the Santa Fe line, near Richland Springs.

Bucy & Burkhead have started work about six miles from Rising Star on their grading contract on the Texas Central extension from DeLeon to Rising Star. Henby Brooks, another contractor, has started work about three miles east of Rising Star. Work will also be started on the De Leon end soon, the grading from De Leon to Rising Star is to be completed by Aug. 1 and the road to be completed about Sept. 1.

The Texas Building Co. has begun work on its grading contract on the first section of the Brownwood North & South R. R.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The A. B. Corey Construction Co. of Ogden, Utah, has begun work on its contract for the construction of a 28-mile pipe line for the Southern Pacific from Strong's Knob to Lemay, on the western side of the lake. The line will cost $100,000 and will be an addition to the pipe line built by the Southern Pacific two years ago from Terrace to Lemay.

The Iron Mountain, St. George & Grand Canyon R. R. Co., recently incorporated, is said to be meeting with success in financing its proposed line, and it is believed likely that construction work may be started soon. As proposed the line is to extend from Thurmo, Beaver county, on the San Pedro, Los Angeles & Salt Lake R. R., south to Cedar City and Kanarra, in the coal region, and thence southwest through St. George to the Santa Fe R. R., in the Hualapai valley, at or near Kingman, Ariz., with a long branch from below Kanarra, southeast through the oil and timber regions to the Grand Canyon of the Colorado River, and shorter but important branches from near Cedar City to the great coal field and iron mountains of Iron county, Utah. J. R. Walker, Charles Read, Elias S. Kimball, A. Hanauer, Jr., Archibald E. Rykert, John H. Woodmansee, and M. T. Burgess, all of Salt Lake City, are interested.

The Utah Copper Co. of Bingham has had engineers in the field completing surveys for the Bingham & Garfield R. R., a subsidiary company organized two years ago to cohstruct a railroad from the Bingham properties to the concentrator at Garfield.

Now that the Western Pacific Ry. is nearly finished to San Francisco, George Gould, it is said, proposes to build a line to Los Angeles. Surveys have been started to complete the lines between Marysvale, Utah, and San Diego, via Los Angeles, and surveys are now being carefully revised that were made 10 years ago by order of Gen. W. J. Palmer and Col. D. C. Dodge. Marysvale is 193 miles southwest of Salt Lake City and the route from there traverses a line parallel to the San Pedro, but on the other side of the range and through a more fertile region.

The Iron Mountain, St. George & Grand Canyon Ry Co. recently incorporated with a capital stock of $24,000,000 by Utah and Los Angeles parties, has filed its articles of incorporation in the office of the county clerk at Phoenix, Ariz. They propose to build a road from Thermo, Utah, a point on the San Pedro, Los Angeles & Salt Lake R. R., to Kingman, Ariz., by way of Cedar City, Harmony, Kanara and St. George. It is also proposed to construct a branch line from Kanara through the Buckskin timber range to the Grand Canyon and for a connection with Los Angeles it is intended to build another branch line from some point on the main line to Maopa or a nearby point on the Los Angeles-Salt Lake road.

West Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Kanawha & Parkersburg Ry. Co. of Charleston, W. Va., has been formed and proposes the construction of a railroad from Dunbar, near Charleston, to Parkersburg. A number of surveys have been made. E. T. Crawford, M. H. Straughan and Frank Cox, all of Charleston, W. Va., are interested.

The Baltimore & Ohio R. R., J. A. Spielman, engineer maintenance of way, Wheeling, W. Va., is to spend $300,000 for the construction of a new freight depot and terminals at Wheeling.

The Norfolk & Western Ry., according to reports, has completed surveys for a line from Wharnecliffe, W. Va., to Pinnacle Creek. The line will be about 60 miles long and will extend up Ben Creek and Gilbert Creek. It will open up extensive coal lands.

Charles A. Simms & Co. of Philadelphia, Pa., have started preliminary work on their contract for improving the Grafton, W. Va., yards of the Baltimore & Ohio R. R.

The Fairmont & Pittsburg Ry. Co. has been organized in West Virginia and proposes the construction of a line from Fairmont north via Blacksville and Waynesburg to Pittsburg, Pa., a distance of about 75 miles. The company is also authorized to construct a loop line from Fairmont northwest to Mannington, Blacksville and Morgantown, thence along the Monongahela River, returning to Fairmont, W. Va. As yet nothing definite has been done.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Construction work will probably be started early this month on the Bellingham-Skagit county interurban line, which is to be built by the Stone & Webster Engineering Corporation. Engineering offices have been opened on the fourth floor of the Sunset block in Bellingham preparatory to beginning construction work.

The Western Washington Railway & Navigation Co. of Aberdeen has been incorporated with a capital stock of $100,000 and proposes to construct an interurban line from Grays Harbor to Puget sound, by way of Elma and Shelton. This is the line recently mentioned as being promoted by W. B. Sammons and C. C. Quackenbush.

New York capitalists are reported to have promised sufficient capital for the construction of the proposed canal of the Olympia Canal Co. on the condition that the people of the state secure the right of way and do the preliminary work. The proposed canal will run from Olympia by way of the Black lake to the Chehalis river, which it is designed to dredge to Aberdeen from the point of entrance of the canal. About $30.000 is needed for the preliminary work, and it is said much of this has already been subscribed in Tacoma. E. L. Kenyon, Olympia, Wash., is secretary.

P. M. Coyne & Son have started work on their contract for constructing a 4,000,000 gallon reservoir for the city of Port Townsend and Fort Worden.

Sanderson & Porter of New York and San Francisco are reported to have obtained control of the Grays Harbor Power & Light Co. interests between Aberdeen, Hoquiam, and Cosmopolis for $2,000,000. The transaction is said to mean immediate construction of an interurban line from Aberdeen to Puget sound cities. The sale includes electric light plants at Hoquiam and Aberdeen, the street railway system between Hoquiam and Aberdeen, and Electric park ball grounds.

Residents of Chehalis are securing right of way for a projected electric line, to run 8 miles northeast to Newaukum Prairie, with a view of continuing farther at a future date. No company to build the line has been organized, but it is believed that capital will

be found when the right of way has been obtained.

W. L. Harris & Co. and Otto Hanson have completed their contracts on the Boulle-Trumbull branch of the Milwaukee and have moved their outfits. Mr. Hanson moved his outfit to Spokane, where he has 10 miles of work extending from Dishman's store to Spokane bridge. W. J. Harris & Co. stored their outfit at Palouse for the present.

Eastern stockholders in the Washington Railway & Electric Co., which proposes the development of a power project located at Sultan, have taken over the interests of C. A. Hudson and John C. Denny of Everett; George D. Emery of Seattle and John Kirkpatrick of Butte, and it is reported actual work will be started this month. The power site is one of the best in this section of the northwest. Here the Sultan River extends through a canyon, and the plan is to build a concrete dam 120 feet high to retain the waters, which engineers estimate will generate 50,000 hp. As planned the water is to be used in a three-level system, three subbasins. A further plan of the company is to construct a railroad from the Sultan canyon to the town of Sultan, 17 miles. The power to be generated will be sold in various cities on Puget Sound for industrial purposes.

Officers of Fort Worden are agitating the construction of an extension of the Port Townsend Southern R. R. to that place.

Construction work has been progressing rapidly on the North Yakima & Valley R. R., and the line is now completed from Granger north through Zillah, Wash.

The Spokane, Portland & Seattle Ry., T. H. Crosweli, Chief Engineer, Portland, Ore., will this year spend $1,500,000 for equipment and improvements.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wisconsin Light & Power Co., which owns the dam at the foot of lower Birch lake, is making preparations to remove the present wooden dam and to replace it with a roller concrete dam 4 ft. higher than the old one.

Lisk & Gifford Construction Co., Davenport, Ia., has begun grading on part of the cut-off of the Soo line between Withrow and New Richmond, Wis. It will grade the portion between Withrow and the St. Croix river, a distance of about eight miles.

McIntosh Bros. have 300 men at work reconstructing an old abandoned tunnel at Tunnel City for the Chicago, Milwaukee & St. Paul Ry. The tunnel is 1,300 ft. long and the contract is said to amount to $1,000,000.

The Chippewa Valley Railway, Light & Power Co. of Eau Claire has purchased the Chippewa Falls Water Works & Lighting Co., including the light, water and gas plants, with unlimited franchises for Chippewa Falls.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The city council of Regina, Sask., has granted a street railway franchise to J. W. DeC. O'Grady, J. A. Anderson, and J. Geddes, all of Winnipeg, Man. According to the terms of the franchise seven miles of track must be laid by Dec. 1, 1910.

The Canadian Northern Ry, track laying outfit has resumed operations on the Shellbrook extension. The grade is completed to within 20 miles of Big River and it is the intention of the railway company to have the line completed by the middle of the year. It is understood that 400 teams and 600 men will be employed.

John Bradley, the contractor, mentioned in our last issue as having been awarded the C. P. Ry. contract for constructing 110 miles of line from Regina, Sask., to Colonsoy, has his headquarters in Brandon, Man. He is now completing the Craven-Bulyea line of 25 miles on which his outfit has been at work all winter, uninterrupted by cold weather or snow. On the C. P. work he will use some 800 teams and over 1,500 men.

The Canadian Northern Ry. has completed the survey of the Swan River branch into Vonda, Sask., and it is believed that the line will be completed this summer as only 25 miles remain to be done. Vonda will be the terminal for a few years pending its extension to Saskatoon.

The Lake Superior Steel Corporation, owner of the Algoma Central & Hudson Bay Ry., is planning an expenditure of about $5,000,000 for extensions to the road. It is expected that the contract will be let this summer for the construction of the extension of the Algoma Central to connect with the Canadian Pacific R. R. The road is already graded from the end of the rails to the Montreal River, while from the north the line from Helen Mine at Michipicoten is graded as far south as the river. C. N. Coburn, Sault Ste. Marie, Ont., is chief engineer.

The Grand Trunk Pacific Ry. has awarded a contract to the J. D. McArthur Co. for the construction of a branch line south from Regina to the boundary near Portal. Contracts have also been let for the completion of a line north from Regina to Melville on the main line of the Grand Trunk Pacific.

The Grand Trunk Pacific R. R. Co. has acquired between 50 and 60 acres of land on the shores of Courtenay Bay for terminal facilities. It has not yet been decided by the officials whether the line will enter St. John, N. B., over the Intercolonial tracks from Moncton or by a direct line from some point in Queen's County. C. C. Van Arsdol, Prince Rupert, B. C., is division engineer of the Grand Trunk Pacific.

A bill is before the railway committee of the House of Commons to incorporate the Toronto Eastern Ry. Co., which proposes to construct a line from Toronto to Cobourg, thence to Peterboro', from Oshawa to Lindsay, from a point in the township of Scarboro' to Uxbridge, and from Oshawa to a point on the water front of Lake Ontario.

The railway committee of the House of Commons has reported a bill to incorporate a company to be known as Montreal, Kapatachuan & Rupert Bay Co. to build a railway from Montreal to Rupert Bay, on Hudson Bay, a distanceof 450 miles. The proposed route is through the counties of Hochelaga, Maisonneuve, Laval, Two Mountains, Argenteuil, Labelle and Pontiac.

Construction outfits have begun to arrive at North Battleford, Sask., preparatory to commencing grading on the Canadian Northern branch line from North Battleford to Prince Albert. It is also said that steel will be laid this year on the 50 miles of grade on the North Battleford-Athabasca line.

Track-laying on the Grand Trunk Pacific Ry. from Prince Rupert, B. C., has been started under the direction of D. J. Dempsey. He will put down the terminal tracks and lay the first 100 miles of main line east from the terminal city. The outfit at present on this work consists of five locomotives, one track-layer, five cabooses, 56 flat cars, two box cars, one water cart, one machine car, six outfit cars, two telegraph outfit cars and a private car.

Mexican Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

S. Pearson & Son, Lt., contractors, City of Mexico, have started preliminary work for the construction of the Conchos River dam of the Mexican Northern Power Co. The contractors have about completed a broad gage railroad from St. Rosalia to the site of the dam. About 40,000 H. P. will be developed and it is planned to have the dam completed in 1912. W. J. Davis, San Francisco, Cal., is chief engineer of the Power Company, and G. F. Greenwood, Montreal, Que., is President.

The Mexican Pacific Ry. (National Lines of Mexico) is reported to have acquired the concession held by the Mexican-American holding company to build a railroad from Salina Cruz to Manzanillo, a distance of 930 miles, and thence down the west coast.

The construction of a new line of railroad from Tucson, Ariz., to a point on the Gulf of California, north of Guaymas, is proposed by Frank Murphy, Prescott, Ariz., President of the Santa Fe, Prescott & Phoenix Ry. The road would be used as a route for ores from the smelters in Arizona to deep waters. Charles T. J. Lantry of the Lantry Constructing Co., Kansas City, Mo., is reported to have the contract for constructing the road.

Right of way is now being secured by the Northern Pacific for the construction of its branch line from Pingree to Wilton, N. Dak.

The Middle Island R. R. Co., of Middlebourne, W. Va., has been incorporated with a capital stock of $5,000 and proposes to build an electric railway from Sistersville by way of Middlebourne, Shirley and Center Point to Clarksburg. The incorporators are T. Moore Jackson, C. P. Stout, of Clarksburg; I. M. Underwood, John F. Shore, Thomas P. Hill, of Middlebourne.

The Southern Land & Water Co., of Lake Charles, La., has been chartered with a capital stock of $200,000. The company will deal in real estate and is empowered to build, erect and maintain canals, irrigation ditches, wells, pumps, and things of that nature. The directors are: David R. Swift, president; William Briggs, vice president, and Thomas G. Trotti, secretary and treasurer.

The Hampton Roads Navigation Co. of Norfolk, Va., has been incorporated with a capital stock of $500,000, for the purpose of building and operating docks, etc. The officers of the company are Charles S. Thorne, president; T. F. Farrell, vice-president; G. W. Woodruff, secretary and treasurer—all of No. 1 Broadway, New York.

The Garrett County Railway Co. has been incorporated in Maryland with a capital stock of $200,000 and proposes the construction of a line from Oakland to Mountain Lake Park, Deer Park, Thayerville, Accident, Grantsville and Frostburg, Md., also from Accident to Friendship and from Grantsville to the Pennsylvania line. The incorporators are G. J. Gugey, Henry M. Speicher, George Padgett, W. Ravenscroft and Charles Lightshier.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Montgomery, Ala—Until noon, April 11, by J. S. Pinckard, 17 South Perry St., Montgomery, Ala., for the construction of a concrete bridge over the Central of Georgia R. R. tracks on Madison Ave.

Red Bluff, Cal.—Until April 8, by Board of County Supervisors, for the construction of a county bridge across the Sacramento River, at Tehama, Cal.

Santa Rosa, Cal.—Until noon, April 7, by F. L. Wright county clerk, for the construction of bridges and culverts on the roads between Headsburg and Geyser.

Weiser, Ida.—Until April 11, by County Commissioners for the construction of three steel wagon bridges in different parts of this county.

Hardin, Ill.—Until 10 a. m., April 11, by County Commissioners for the construction of an arch stone bridge across the creek on county road between Barney Droege's and Henry Doege's.

North Chicago, Ill.—Until noon, May 14, by Bureau of Navigation, Navy Department, Washington, D. C., for the construction of a concrete arch bridge and connections thereto at the U. S. naval training station, Great Lakes, North Chicago, Ill.

Cumberland, Md.—Until 1 p. m., April 16, by County Commisioners for the construction of a steel and concrete bridge over the Potomac River between Luke, Md., and Piedmont, W. Va.

St. Joseph, Mo.—Until 2 p. m., April 11, by M. Weber, City Clerk, for the construction of the superstructure for a swing bridge on Wayne St. over the Morrison Channel and the Michigan Central tracks.

Nelson, Neb.—Until noon, April 19, by County Clerk, for the construction, completion and repairing of all the wood and steel bridges to be built or repaired in said county during the year commencing April 19.

Syracuse, N. Y.—Until 1:30 April 11, by Board of Contract and Supply, for constructing a reinforced concrete arch bridge over Onondaga Creek at Dickerson St., in the city of Syracuse, N. Y. John J. Halloran is secretary of the board.

Batavia, O.—Until noon, May 2, by J. L. Larkin, County Auditor, for the construction of

the substructure and superstructure of a bridge over Stonelick Creek on the Xenia road near Edenton, in Clermont County.

Cleveland, O.—Until 11 a. m., April 23, by Board of County Commissioners, for the construction of bridge work per report No. 2585, Concrete culvert, Coventry Road, E. Cleveland township; Report No. 2586, Concrete culvert, Coventry Road, E. Cleveland township.

Buffalo, Okla.—Until 1 p. m., May 2, by Board of County Commissioners, for necessary labor and material for the construction of the three wooden truss bridges, 40 ft. long and 14 ft. roadway, on pile foundations. E. L. Hubbard is County Clerk.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Mare Island, Cal.—Until 11 a. m., May 14, by Bureau of Yards & Docks, Navy Department, Washington, D. C., for the construction of an ordnance storehouse at the Navy Yard, Mare Island, Cal. R. C. Hollyday is chief of the bureau.

New London, Conn.—Until 10 a. m., May 6, by Capt. F. T. Arnold, Constructing Quartermaster, New London, Conn., for the construction, plumbing, heating, electric wiring and fixtures of one double and two single company officers' quarters, one guard house, one ordnance shop, one coal shed and one wagon shed at Fort H. G. Wright, N. Y. Official advertisement will be found elsewhere in this issue.

Fort Screven, Ga.—Until 11 a. m., April 25, by Constructing Quartermaster, Fort Screven, Ga., for the construction, plumbing and electric wiring of one double set civilian employes' quarters.

Covington, Ind.—Until 4 p. m., April 12, by School Commissioners, for the construction of a basement and one story school building of 15 rooms. E. J. Martin is secretary.

Jeanerette, La.—Until noon, April 16, by L. A. Moresi, chairman of Building Committee, for the erection of school building at Jeanerette, La. Favrot & Livaudais, Ltd., 839 Gravier St., New Orleans, La., are the architects.

Austin, Minn.—Until 3 p. m., May 9, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Austin, Minn.

Great Falls, Mont.—Until 3 p. m., May 10, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating and ventilating apparatus, electric conduits and wiring and standard clock system of the U. S. Post Office and Court House, at Great Falls, Mont.

New York, N. Y.—Until 11 a. m., April 15, by Board of Water Supply, 910, 299 Broadway, New York, for Contract No. 74, for the construction of a field office building and horse shed for division and section engineers in the White Plains division of the Catskill Aqueduct, at a site 1½ mile east of Elmsford Station on the Putnam division of the New York Central and Hudson River R. R., in the town of Greenburg, N. Y.

New York, N. Y.—Until 11 a. m., April 12, by Lawrence Gresser, president of the borough of Queens, for all material and labor required for furnishing and installing electric combination and gas lighting fixtures in the Queens County Court House, Long Island City, borough of Queens, city of New York.

New York, N. Y.—Until 11 a. m., April 11, by C. B. J. Snyder, Superintendent School Buildings, Department of Education, corner of Park Ave. and 59th St., Manhattan, New York, for completing and finishing the new fireproof main stairs at public school 46, 156th St. and St. Nicholas Ave., borough of Manhattan.

New York, N. Y.—Until 11 a. m., April 11, by C. B. J. Snyder, Superintendent of School Buildings, Department of Education, corner of Park Ave. and 59th St., Manhattan, New York, for alterations, repairs, etc., at public schools 5, 9, 10, 43, 46, 54, 81, 93, 132, 157, 165, 166, 169, 170, 179, 184, and 186, and Wadleigh High School, borough of Manhattan.

New York, N. Y.—Until 11 a. m., April 11, by C. B. J. Snyder, Superintendent of School Buildings, Dept. of Education, corner Park Ave. and 59th St., for alterations and repairs, etc., at public schools 48, 80, 95, 102, 118, 128, 134, 139, and 140, borough of Brooklyn.

Newark, O.—Until 3 p. m., May 7, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus and electric conduits and wiring of the U. S. Post Office at Newark, Ohio.

Cleveland, Tenn.—Until 3 p. m., May 6, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction, including plumbing, gas piping, heating apparatus, electric conduits and wiring of the United States Post Office at Cleveland, Tenn.

Puget Sound, Wash.—Until 11 a. m., May 7, by Bureau of Yards and Docks, Navy Department, Washington, D. C., for the construction of an oil storage house at the United States Navy Yard, Puget Sound, Wash.

Appleton, Wis.—Until 3 p. m., May 12, by James Knox Taylor, Supervising Architect, Treasury Department, Washington, D. C., for the construction complete, including plumbing, gas piping, heating apparatus, electric conduits and wiring, of the United States Post Office, Appleton, Wis.

Cheyenne, Wyo.—Until 5 p. m., April 19, by Water and Sewerage Committee, for labor and materials for the construction of a reinforced concrete valve house, five miles from Cheyenne.

Ottawa, Ont.—Until 5 p. m., April 15, by Napoleon Tessier, Secretary, Department of Public Works, for restoration of and additional story to Military Stores building, Ottawa, Ont.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

San Diego, Cal.—Until 11 a. m., April 25, by Lieut. C. A. Lohr, Constructing Quartermaster, San Diego, Cal., for the construction approximately 3 miles of roadway, including gutters, culverts, etc., through military and naval reservations, Fort Rosecrans, Cal.

Clarinda, Ia.—Until 7:30 p. m., April 12, by C. W. Stuart, City Clerk, for the construction of about 20,500 sq. yds. of concrete pavement of 5 ins. of Portland cement concrete.

Fort Des Moines, Ia.—Until 3 p. m. April 28, by Constructing Quartermaster, Fort Des Moines, Ia., for the resurfacing of certain macadam roads at Fort Des Moines, Ia., including approximately 44,000 sq. yds.

Perry, Ia.—Until April 15, by City Clerk, for the construction of the following paving work: Contract 1—20,000 sq. yds. Warren's bitulithic pavement on a concrete foundation; 9,500 ft. of combined curb and gutter; 5,000 cu. yds. of grading. Contract 2—33,700 sq. yds. of creosoted block on a concrete foundation; 18,850 ft. of 6x20-in. cement curb; 11,000 cu. yds. of grading. Charles Wilson is City Engineer.

Oak Park, Ill.—Until 4 p. m., April 12, by B. C. Brandstadt, Secretary, Board of Local Improvements, for resurfacing Euclid Ave. with an asphalt pavement, between South Blvd. and Madison St., Oak Park Special No. 200; also for constructing an asphalt pavement and granite concrete combined curb and gutter on 64th Ave. between Madison St. and Jackson St., Oak Park Special No. 203. Official advertisement of the work will be found elsewhere in this issue.

Peoria, Ill.—Until 2 p. m., April 11, by Board of Local Improvements, for the resurfacing with asphalt of the roadways of the following: Seventh Ave., from Franklin to Union Sts.; Hamilton St., from Monroe to Glen Oak Av.; Hamilton St., from Randolph to North St.; North Jefferson Ave., from Hamilton to Cornhill St. George F. Simmons is president of the Board.

Covington, Ind.—Until 1:30 p. m., April 5, by County Commissioners, for the construction of a gravel road in Mill Creek township. W. B. Gray is auditor of Fountain county.

Rockville, Ind.—Until 1:30 p. m., April 5, by County Commissioners, for the construction of a gravel road in Jackson township. H. A. Henderson is auditor for Parke county.

New Castle, Ky.—Until April 12, by Fiscal Court of Henry County, for the construction of 41 miles of turnpike roads. Work includes hauling, spreading and breaking rock.

Boston, Mass.—Until noon, April 12, by Highway Division, Street Department, for constructing macadam roadway and artificial stone sidewalks in Mechanic St., Roxbury.

Boston, Mass.—Until noon, April 12, by Highway Division, Street Department, for constructing macadam roadway and artificial stone sidewalks in Edgar St., Roxbury.

Boston, Mass.—Until noon, April 11, by Highway Division, Street Department, for constructing macadam roadway and artificial stone sidewalks in Wentworth St., Dorchester.

Boston, Mass.—Until noon April 11, by Street Department, Highway Division, for the construction of a macadam roadway and artificial stone sidewalks in Whitman St., Dorchester.

Lincoln, Neb.—Until 1 p. m., April 8, by Roscoe C. Ozman, City Clerk, for the construction of paving throughout the Paving District No. 174.

Cincinnati, O.—Until noon, April 22, by County Commissioners, for the improvement of the Symmestown road between Billiard's hill and Weller School, in Symmes township. Under Spec. No. 973. Fred Dreihs is clerk.

Cincinnati, O.—Until noon, April 29, by Board of County Commissioners, for improving North Bend and Burnt School House Roads, from Harrison pike to what is known as Fiffin Pike or Lincoln Ave., Green township. Fred Driehs is clerk.

Cleveland, O.—Until 11 a. m., April 16, by Board of County Commissioners, for the grading, draining and improving of the Bradley Road, from Lake Road to North Ridge Road, in Dover township. Frank R. Lander is County Surveyor. John Goldenbogen is clerk of the Board.

Columbus, O.—Until noon, April 12, by Director of Public Service for the improvement by grading and paving of portions of 16 streets, avenues and allies.

Ellensburg, Wash.—Until April 11, by City Clerk, for the construction of 23 blocks of paving in the business district of the city. The work includes 49,200 sq. yds. of paving; 17,000 cu. yds. of excavation; 16,000 ft. of concrete curbing.

Moose Jaw, Sask.—Until 8:30 p. m., April 11, by W. F. Heal, City Clerk, for the following work: Contract A—Furnishing material and constructing 33,300 sq. yds. of pavement. Contract B—Furnishing material for and constructing 13,500 lin. ft. of combined curb and gutter. Contract C—Furnishing material for and constructing 115,500 sq. ft. of concrete sidewalks.

Sewers.

Bids are asked on following work, the notes being arranged alphabetically by states:

Kissimmee, Fla.—Until 7:30 p. m., April 12, by City Council for the necessary materials and labor for the construction of a complete water works and sewer system. J. R. Gilbert is City Clerk.

Boston, Mass.—Until noon, April 8, by Sewer Division, Street Department, for cleaning sewers in Dorchester Ave., and other specified streets.

Boston, Mass.—Until noon, April 8, by Sewer Division, Street Department, for supporting tracks for proposed sewerage works under the tracks of the Boston & Albany R. R. at Salt Creek, Brighton.

Albert Lea, Minn.—Until April 15, by C. J. Dudley, City Clerk, for the construction of 1,496 lin. ft. of 8-in. sewers; 298 lin. ft. of 12 and 22 in. double sewers, 8 to 14 ft. deep; 320 lin. ft. of 12 to 20 in. double sewers, 8 to 12 ft. deep; 210 lin. ft. of 10-in. drains; 9 manholes, 6 catch basins. William Barneck is City Engineer.

Madison Barracks, N. Y.—Until 2 p. m., April 28, by Constructing Quartermaster, for the construction and repair of about 840 ft. of sewers.

Columbus, O.—Until noon April 12, by Director of Public Service, for the construction of sewers in portions of six alleys, streets and avenues. H. S. Holton is director.

Mamaroneck, N. Y.—Until 8:30 p. m., April 6, by Village Trustees, for the construction of approximately 4,525 lin. ft. of sewers. Charles W. Buckter is clerk.

Reidsville, N. C.—Until 8 p. m., April 21, by Board of Commissioners for the necessary labor and material for the construction of a system of sanitary sewers for the town of Reidsville, N. C. The work includes approximately 10 miles of vitrified pipe sewer from 8 to 15 ins. diameter, three sewage pumping stations and reduction tank. L. H. Hardy, Jr., is Town Clerk and E. W. Myers, Greensboro, N. C., is engineer.

Lima, O.—Until noon April 14, by Board of Control, for furnishing material and labor necessary for the construction of a sewer from Third St., to the south corporation line, by way of Blaine Ave., Fourt and Metcalf Sts. Glen I. Wallace is secretary of the Board.

Lorain, O.—Until noon April 16, by Director of Public Service, for furnishing the necessary labor and material for the construction of a storm water sewer in Colorado Ave., East Erie Ave., Connecticut Ave. and A St. L. B. Johnson is clerk.

Perry, O.—Until noon April 9, by Board of County Commissioners, for furnishing necessary labor and material for sewerage system, tunnels, floors, etc., in the Perry County Infirmary. George T. Drake is clerk of the Board.

Youngstown, O.—Until noon April 7, by Director of Public Service, for furnishing the necessary labor and materials for sewering Penn Ave., between Oak St. and Augustus St., between Penn Ave and Hine St. W. H. McMillin is clerk.

Youngstown, O.—Until noon, April 7, by Director of Public Service, for furnisihng necessary labor and material for the construction of sewers in Penn Ave., between Oak St. and Augustus St., Augustus St., between Penn Ave. and Hine St. W. H. McMillin is clerk.

Tyndall, S. Dak.—Until 7 p. m., April 14, by city, for the construction of an electric light plant and changes and improvements to present water works system. J. J. Maus is City Auditor.

Abilene, Tex.—Until 3 p. m., April 9, by city for the construction of a concrete storm sewer. The work includes about 760 ft. of 42-in. sewer; 1,480 ft. of 48-in. sewer; 300 ft. of 60-in. sewer, with necessary laterals and intakes. The average depth of the excavation is 8 ft. C. E. Leonard is Supervising Engineer.

Moose Jaw, Sask.—Until 8:30 p. m., April 11, by W. F. Heal, City Clerk, for trenching and laying 7,100 lin. ft. of 10-in. and 12-in. sewer pipe.

Water Supply.

Bids are asked on following work, the notes being arranged alphabetically by states:

Fort Oglethorpe, Ga.—Until 11 a. m., April 14, by George Vidmer, Captain, Constructing Quartermaster, for sinking two 8-in. tubular wells at the post.

Springfield, Ill.—Until noon, April 11, by Board of Administration, for the construction of a steel tower and tank at the Kankakee State Hospital, Kankakee, Ill. Frank D. Whipp is Fiscal Supervisor.

Boston, Mass.—Until 10 a. m., April 23, by Capt. A. M. Miller, Constructing Quartermas-

Wood Piling and Ground Water Level.

A point not so often allowed for as it should be in planning the use of wooden piles is the change in water level that is likely to occur particularly in large cities, where sewers, subways and other structures affecting underground water levels are continually being constructed. Wooden piling to be permanent must be entirely below water and engineers plan their permanent pile structures always with this in mind. It cannot be too confidently assumed, however, that piles whose tops are well below water when the foundation is built will still be below water level a few years later. This fact is being continually brought to mind by rebuilding work going on in New York, Chicago and other large cities. Bulkheads built at certain points along the Chicago River of piles capped with concrete and having the piles submerged when built now show the pile tops exposed. Changes in the drainage conditions have lowered the water level. In tearing down recently a building constructed some ten years ago in Milwaukee on pile foundations the pile tops were found some 3 ft. above the water level, though when the building was constructed they had been placed below it. The sewerage and drainage work of the intervening years had lowered the original water level. The same fact was noted in our issue of Jan. 12, 1910, in connection with the Cambridge Building in New York city. The lesson of these occurrences is obvious, for no one can doubt that they represent quite common conditions. Ground water levels depend entirely on drainage conditions, and in cities drainage conditions are seldom the same for any long time. The engineer who puts in permanent pile work therefore runs a hazard of having it exposed to rot by succeeding constructions affecting ground water levels unless he is very certain of his conditions.

The Efficiency of the Engineering Administration of the U. S. Reclamation Service.

ENGINEERING-CONTRACTING holds no brief for the engineers of the U. S. Reclamation Service. It does not believe in the policy of the Service of doing a large portion of its construction work by force account and it has said so, and, when the occasion seems to warrant, it will say so again. This journal, however, has never questioned the honesty of purpose of the Reclamation Service Engineers in resorting to the policy of day labor work; it can even see how they may have considered it to be, under the conditions, the only policy. It does not think that their decision to use day labor had any other motive than to serve best the interests of the public. Neither does ENGINEERING-CONTRACTING believe because this mistake has been made or because other errors in details will be discovered that the engineering administration of the Reclamation Service is necessarily inefficient. It believes that a count will show many more things to praise than things with which to find fault.

We make these statements here because of the communications which have come to us in various forms, seeking for criticism in our columns of the engineering work of the Reclamation Service. One of these communications is printed among our Letters to the Editor this week. We publish this letter because it represents the opinion of others as well as of the writer and because its assertions are the mixture of truth and fallacy that characterizes the assertions of others besides the writer, and for the same reasons we shall comment in detail on its statements.

One correspondent's first count against the management of the Reclamation Service work is its employment of inexperienced engineers. The Service has employed inexperienced engineers—it had to. All of the engineers it employed, however, were not inexperienced even at the first; we can call to mind the names of a number whose proficiency in hydraulic and irrigation work ranked very high. It was almost necessarily the fact that many of its engineers at first should lack specific experience in reclamation work. Enough engineers with experience were not available under the conditions. A reclamation engineering corps had to be trained and developed. There was no other resort and had there been it is by no means certain that the method adopted would not have been the best. The important question is: Has this trained reclamation engineer corps been developed? We believe that it has been in large measure. Certainly no one can believe that the present force of Reclamation Service engineers as a whole, or even in large part, could be replaced off-hand with a force equally trained and experienced in the work. If it can, then truly a charge of inefficiency of engineering management is warranted.

It is doubtless true that individual cases exist where better men could be had and should be got. It is also true that many of the better men and some of the very best have resigned from the Service. This brings us to the third and fourth counts made by our correspondent, and, incidentally, to some others not made by him. Insufficient pay for competent engineers is a true charge. Incidentally it is a true charge applied to engineers' services generally. The engineers directing the Panama Canal work, as this journal has said before, are paid absurdly little in proportion to their responsibilities and duties. Most of the resignations of engineers from the Reclamation Service, at least until very recently when other considerations have entered into the question, have been to accept better paying positions elsewhere. Our correspondent charges the head of the Reclamation Service with inability to see and correct this condition among others. Probably it is true that he is unable to correct, but it is, so far as we can judge, not true that he is unable to see the need for correction. We shall consider this point immediately, but first let us point out that because the pay in the Reclamation Service for competent engineers is insufficient it does not follow that these engineers are as a whole incompetent.

The heads of the Reclamation Service have not been blind to the matter of insufficient pay or to the matter of resignations of its best trained engineers. In the testimony of Chief Engineer Arthur P. Davis before the committee of Congress now investigating the Service will be found repeated statements of the fact that the salaries paid by the Service are lower than those paid in the commercial world, and that it is only by imbuing the men with pride in the Service and with the feeling that their ability is recognized and commended by the Service that able men can be kept. To quote Mr. Davis' words:

> It has been the constant effort and chief function of the director and myself to find the right kind of men, to recognize ability when we see it and keep it satisfied with appreciation so that we can hold it. The highest function of administrative ability is that of recognizing ability in others and commanding it. The Reclamation Service does not pay high enough salaries to hold men by the inducement of salaries alone.

This statement indicates no lack of ability to see that salaries in the Service are low for the services rendered by competent men; it does indicate on the contrary that the drawback is fully appreciated and that effort has been made to offset it by the only substitute that appeals to one's ambition.

Our correspondent brings up the charge of severe treatment of contractors by the Service; he hints even at trickery and underhand methods. This accusation has been made before and has been vigorously denied by the engineers of the Reclamation Service. Beyond this the evidence offered to the public has not gone, and judgment must be withheld until we have something more on which to base it than mere accusation and denial.

Our correspondent considers that the Reclamation Service engineers are no better prepared now to make correct estimates than they were when work was first begun. We cannot agree. These engineers have had actual experience in irrigation work and having done much of the work by day labor they have collected a vast number of cost data. They cannot help being better prepared now to make correct estimates.

ENGINEERING-CONTRACTING would not see the Reclamation Service engineers relieved one whit from their accountability to the public, it would not have them protected by a shadow from a critical accounting of their work, but it would have reason and justice.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Design and Construction of Concrete Retaining Walls for Pennsylvania R. R. Terminal Station New York City.*

The excavation for the Pennsylvania R. R. terminal station in New York city is a rectangular pit bounded by 7th and 9th avenues on the east and west and by 33d and 31st streets on the north and south.

The plan, from the earliest stages, contemplated founding the retaining wall on the surface of the rock, where of suitable quality, and afterward excavating the rock in front of the toe of the wall to sub-grade. This plan was definitely adopted soon after the borings were completed, on account of the great danger of blasting out large quantities of rock in timbered trenches close to buildings founded on soft material, and also to avoid the additional cost and delay that would have been caused by carrying the walls to sub-grade. The retaining walls in 7th Ave., south of the viaduct, and in 9th Ave., north of the viaduct, were not governed by the same conditions as in the streets. The dip and quality of the rock at both points required that the walls be carried to sub-grade, and they are, in fact, face walls; the 9th Ave. wall, in particular, having little thrust to retain, is very light.

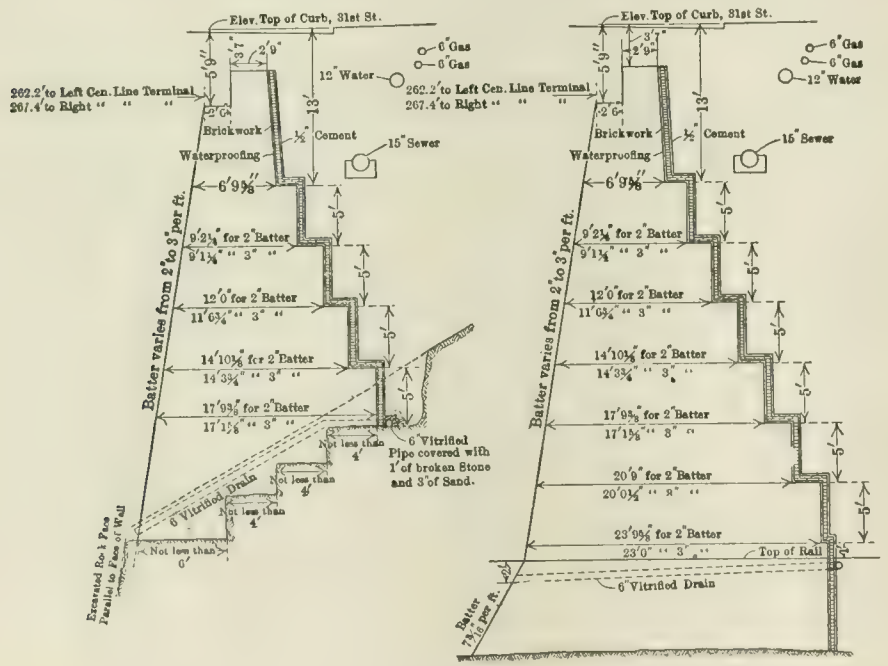

Fig. 1—Typical Sections of Retaining Walls Pennsylvania Terminal Station.

The results aimed at in the design and location of the retaining walls in 31st and 33d streets were: 1st. A perfectly stable wall under all conditions that might reasonably be expected; 2d. As much room as possible at the elevation of the top of the rail; 3d. The least necessary interference with adjoining property during construction; and, 4th. The most economical wall that would fulfill the other conditions.

The assumptions made in designing the wall were as follows: 1st. Weight of concrete, 140 lb. per cu. ft. 2d. Weight of material from the surface of the ground to a depth of 12 ft. (which was shown by tests made in bore-holes to be the elevation of the ground-water surface), 100 lbs. per cu. ft.; and angle of repose, 30°. The distance of 12 ft. below the surface was the depth of the inverts of the sewers, which undoubtedly drained the ground above them, thus accounting for the standing of the ground-water in planes practically parallel with the surface. 3d. Weight of buildings back of wall neglected, as that of the present type which will about equal the cellars filled with material at 100 lbs. per cu. ft., and if large buildings are erected in the future they will undoubtedly be carried to rock. 4th. Reaction from superstructure, live and dead load, 20,000 lbs. per lin. ft. of wall. 5th. Weight of materials below the 12-ft. line, 124 lbs. per cu. ft., ascertained as follows: The material was considered as weighing 165 lbs. per cu. ft. in the solid, and having 40 percent of voids filled with water at 62.5 lbs. per cu. ft., the resulting weight being

$$\left(165 \times \frac{60}{100}\right) + \left(62.5 \times \frac{40}{100}\right) = 124$$

lbs. per cu. ft. Various angles of repose were used for this material in the investigation, and it was finally decided that 30° was the greatest angle that could be expected, whereas the worst condition that could be anticipated was that the sand and water would act separately and give a pressure as follows: Hydraulic pressure from liquid weighing 62.5 lbs. per cu. ft. plus pressure from sand with angle of repose at 30° and weight as follows:

$$\text{Weight of 1 cu. ft. in air} = 165 \times \frac{60}{100} = 99$$

lbs. Weight of water displaced by 1 cu. ft. $= \frac{60}{100} \times 62.5$ lbs. $= 37.5$ lbs. Weight in water therefore $= 61.5$ lbs. per cu. ft.

These combined weights of course are equal to the weight of the combined material in the previous assumption. 6th.—The usual requirement that the resultant of both horizontal and vertical forces should at all points fall within the middle third of the wall, or, in other words, that there should be no tension in the concrete.

With these assumptions, investigation was made of walls with various batters and differently designed backs. This investigation developed the fact that the reaction from the superstructure was so great that for economy both in first cost and space occupied the batter must be sufficient to cause that reaction to fall within or very close to the middle third. Nothing could have been gained by having that reaction fall back of the front of the middle third, as the wall was required to be stable against the full pressure before the superstructure was erected, and in case it should ever be removed, or, to state the matter more clearly, the reaction from the superstructure was so great in comparison to the weight of the wall that if it fell in front of the resultant of all the other forces the width of base required would be greatly increased to make the wall stable after the superstructure fell back of the resultant of all the other forces, the width of base could not be correspondingly decreased without danger of the wall being overturned before the superstructure was erected. The least batter that would answer those conditions was found to be 2 ins. per ft.

For convenience in designing and economy in constructing the steel work the faces of the bridge seat and of the back wall were laid parallel to the center line of the terminal and in elevation on line parallel to the top of the curb and as near to it as the economical depth of steel would permit, without bringing the finished construction above the plane fixed in the ordinance. As there is a variation of 13 ft. in the elevation of the top of the curb of 31st St. above the top of the rail and a variation of 18 ft. in 33d St., a uniform batter, with the top parallel to the center line, would produce a toe varying in distance from it and from the other constructions. It was decided, therefore, for the sake of appearance, to make the face of the wall (or wall produced) at the top of the rail parallel to the center line and to vary the batter accordingly, using the 2-in. batter previously mentioned as the minimum. This gave a maximum batter of 3 ins. per ft. The variation is so gradual that it is unnoticeable, and is not sufficient to introduce any complications in construction.

The wall was designed with a stepped back, primarily to allow the water proofing and brick protection to be held in position more readily. The first step was put at 13 ft. below the surface of the ground. This gave a vertical back above that point for a 3-in. battered face, and a slightly battered back for sections having a less batter in front. Below that point a step was added for each 5 ft. of depth to the elevation of the top of the rail, or to the foundation of the wall if above that elevation. As the horizontal distance of the heel of the wall at its greatest width from its face at the top of the rail would determine the effective room to be occupied by the wall, it was determined to make the back vertical below the top of the rail and gain the necessary increase in width below that point by making a heavy batter on the face.

The type of wall having been thus determined, calculations were made of the width of base required for each ¼-in. batter from 2 to 3 ins. inclusive, first for a depth of 13 ft. below the top of the curb and then for each 5 ft. below that elevation, to a depth corresponding to the distance between the top of the curb and the top of the rail at the point of greatest variation. These widths of wall were determined for the two pressures previously decided on, and curves were then plotted showing the thickness of wall required for each batter calculated and for each pressure. Typical sections of the wall and pipes back of it are shown by Fig. 1.

The plant employed for the retaining wall work comprised: Three cableways, with 35-ft. towers of 12x12-in. yellow pine timber

*Extracts from a paper by George C. Clark, Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 480.

capable of spanning 350 ft. and operated by 7x10-in. double-drum Lambert hoisting engines mounted with 25-h.p. Lambert upright boilers; five stiff-leg derricks, with masts from 35 to 50 ft. long and booms from 45 to 60 ft. long, operated by 7x10-in. Lambert double-drum and swinging gear engines, mounted with 25-h.p. upright Lambert boilers; six Cameron pumps, varying in size from 7x6x13 ins. to 10x8x16 ins., the first dimension referring to the diameter of the steam cylinder, the second to that of the water and the third to the stroke; five Rand sheeting drivers; two Ransome ¾-cu. yd. concrete mixers, mounted on frame, with kerosene driving engine; drills drawn from pit plant as required.

Excavation for Retaining Walls.—Two essentially different methods were used in excavating for and building the retaining walls; one, construction in the trench, the other, construction on the bench. In general, the trench method was used wherever the rock on which the wall was to be founded was 12 ft. or more below the surface of the street, or what is perhaps a more exact statement, as it includes the determining factor, where the buildings adjoining the wall location were not founded on rock.

In the trench method the base of the wall was staked out on the surface of the ground, the required width being determined by the elevation of the rock, as shown by the borings. The contractor then added as much width as he desired for sheeting and working space, and excavated to a depth of about 5 ft. before setting any timber. In some cases the depth of 5 ft. was excavated before the cableway or derrick for the excavation was erected, the wagons being driven directly into the excavation and loaded by hand, but usually the cableway was first erected and buckets were used from the start. After the first 5 ft. had been excavated, two sets of rangers and struts were set, the first in the bottom of the excavation and the second at the level of the street surface, supported by posts resting on the bottom rangers. The sheeting was then set, and all voids back of it were filled with clean earth and well tamped. The toe of the sheeting was kept level with the bottom of the excavation until the ground water was reached, after which it was kept from 3 to 5 ft. ahead of the digging.

The sheeting used was 3-in., in variable widths; it was always tongued and grooved on the side of the trench next to the buildings and in the deeper excavations on both sides of the trench, and was driven by wooden mauls above the ground water level, but steam sheeting drivers were used below that elevation. Struts, rangers, and posts were generally 12x12 ins.

Some exceedingly bad material was encountered in the deeper excavations, beds of quicksand being passed through, varying in thickness from 1 to 18 ft., the latter in 31st St. between 7th and 8th avenues in the deepest excavation made. After encountering the fine sand in that trench, no headway was made until a tight wooden cylinder was sunk through the sand by excavating the material inside of it and heavily weighting the shell with pig iron. When this cylinder had reached the gravel, which lay below the sand, it was used as a sump, and the water level was kept below the bottom of the excavation, which permitted good progress. Sand continued to flow under the sheeting to such an extent, however, that the front walls of four adjoining buildings were badly cracked and had to be taken down and rebuilt. All the stoops along this trench settled and had to be repaired.

The bench method of excavating for the retaining wall was very simple, and was used only where the rock lay near the surface and the adjoining buildings were founded on it, the overlying material being in such case dry and consequently firm, little or no shoring was required. The method was to extend the pit excavation to a width of 2 or 3 ft. beyond the proposed back of the retaining wall, and to carry that width down to the depth required for its base, below which the excavation was narrowed to 1 ft. inside of the face of the wall and continued either before it was built or subsequently.

Retaining Wall Construction.—The concrete walls were built in sections 50 ft. in length, except where that spacing would bring an expansion joint under a girder pocket or just on line with a tier of struts, in which cases the section was shortened as required. Trenches were never allowed to remain open at the full depth, the concreting being started as soon after the necessary length of rock had been uncovered as the forms and preliminary work for a section could be prepared. Each section was a monolith, except in a few cases where very heavy rains made it impossible to hold the laborers.

The various operations in building the concrete wall are shown by Fig. 2. Guide planks, *"a a,"* Section *"A-A,"* were securely spiked to alternate tiers of struts for the length of the section, the face of each guide plank being set on line with the intended face of the concrete wall, and 2-in. tongued and grooved spruce plank were laid along the guide plank to the height of the bottom strut and securely braced from the front sheeting. A 4-in. brick wall was built simultaneously on line with the back of the wall to the height of the first step. Where the bottom strut was below that elevation, the brickwork was left low at that immediate point and built up when the strut was removed. The brick wall was then water proofed on the side toward the concrete and loose laps of the water proofing were allowed to hang over the brickwork and at least 8 ins. down the back. A 6-in. vitrified pipe drain was then laid along the surface of the rock just outside of the brick wall, the joints in the pipe being caulked with oakum saturated in cement, and pointed with cement mortar above a line 1 in. below the horizontal diameter, the remainder of each joint being left open. Cross drains were laid from tees in the back drain to the face of the wall at all low points in the rock and at least for every 25 ft. of wall length, the joints of these discharge pipes being caulked and cemented throughout. The surface of the rock was then washed and scraped clean, and was covered with about 1 in. of mortar, after which the section was ready for concrete.

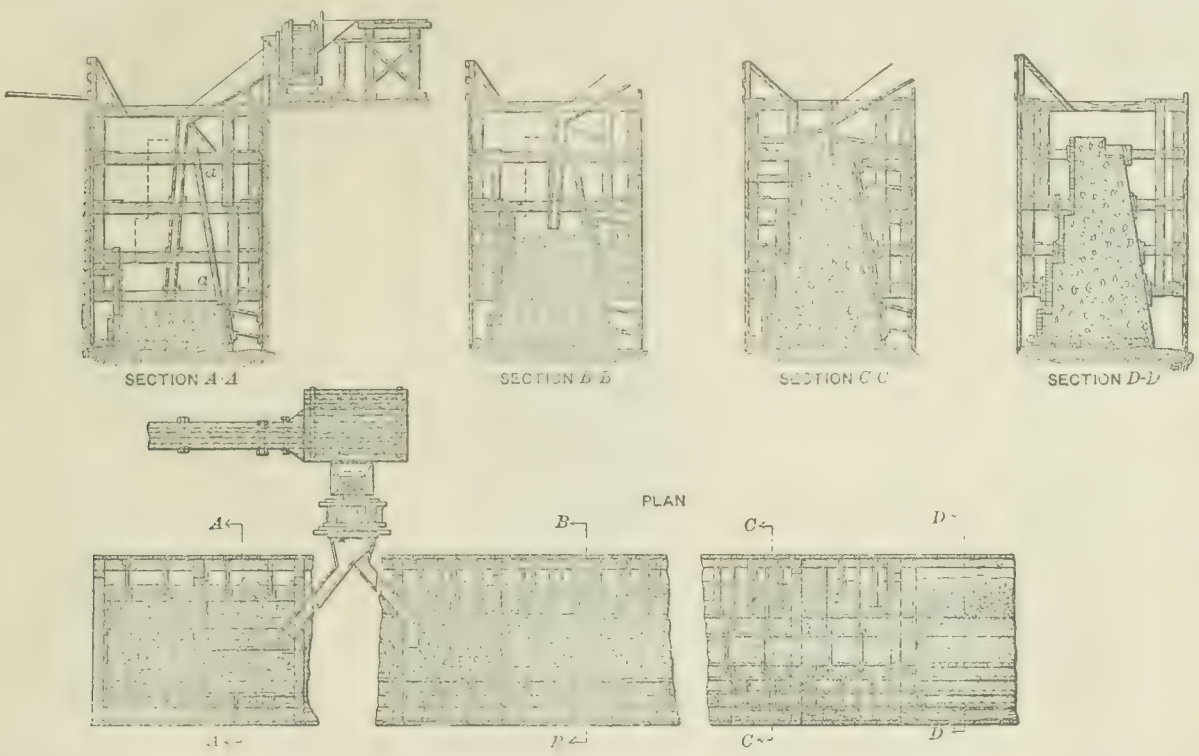

Fig. 2—Sketches showing Forms For and Methods of Concreting Retaining Walls, Pennsylvania Terminal Station.

The building of monolithic sections in trenches required that the thrust from one set of struts be taken by the concrete before the set above could be removed, and necessarily caused slow progress, the rate at which concrete was deposited being just sufficient to prevent one layer from setting before the next layer above could be placed.

The concrete used was mixed in the proportions of 1 part of cement to 3 parts of sand and 5 parts of stone, in 2-bag batches, in ¾-yd. and 1-yd. Ransome portable mixers mounted with air-driven engines on the same frame. These mixers were placed at the surface, and were charged with barrows, the correct quantities of sand and stone for each batch being measured in rectangular boxes previous to loading the barrows. The concrete was discharged from the mixer into a hopper which divided into two chutes, only one of which was used at a time, the concrete being shoveled from the bottom of the chutes to its final position. Facing mortar, 2 ins. thick, was deposited simultaneously with the

concrete, and was kept separate from it by a steel diaphragm until both were in place, when the diaphragm was removed and the two were spaded together. The bottoms of the guide planks were cut off just above the concrete as it progressed, and as soon as the wall had reached a strut at one end of the section that strut was removed, the form was built up to the next strut, at front and back, and braced to the sheeting, so that by the time the entire length of the section had been carried up to the level of the first line of struts, forms were ready at one end for the succeeding layers. The layers of concrete never exceeded 8 ins. in height, and at times there were slight delays in the concreting while the carpenters made ready the next lift of forms, but such delays were rarely long enough to permit the concrete to take its initial set.

After a section of concrete had firmly set, both back and front forms were removed and the thrust from the sides of the trench was transferred directly to the finished wall. The face of the wall was rubbed with a cement brick to remove the marks of the plank and was then coated with a wash of thin cement grout. The water proofing and brick armor were then continued up the back of the wall, the spaces between the lines of braces being first water proofed and bricked and the braces transferred to the finished surface, after which the omitted panels were completed. The water proofing consisted of three layers of Hydrex felt, of a brand known as Pennsylvania Special, and four layers of coal tar pitch. The pitch contained not less than 25 per cent of carbon, softened at 60° F. and melted at a point between 96° and 106° F. The melting point was determined by placing 1 gramme of pitch on a lead disk over a hole 5/16 in. in diameter, and immersed in water which was heated at the rate of 1° per minute; the temperature of the water at the time the pitch ran through the hole was considered as the melting point.

In order to prevent the water proofing from being torn at the joint between sections when they contract from changes in temperature, a vertical strip of felt 6 ins. wide was pitched over each joint, lapping 3 ins. on each concrete section. The back of this strip was not pitched, but was covered with pulverized soapstone, so that the water proofing sheet was free from the wall for a distance of 3 ins. on either side of each joint.

Concreting was continued during the severest weather, one section being placed when the thermometer was 5° above zero. When the thermometer was below the freezing point both sand and stone were heated by wood fires in large pipes under the supply piles; the temperature of the mix was taken frequently, and was kept above 40°. Numerous tests made while the work was in progress showed that, while the temperature fell slightly soon after the concrete was deposited, it was always from 2° to 5° higher at the end of 2 hours. The face and back of the concrete were prevented from freezing by a liberal packing of salt hay just outside the forms.

A vertical hog trough, 24 ins. wide and 9 ins. deep, was placed in one end of each section for its full height below the bridge seat, into which the next section keyed, and when the temperature at the time of concreting was below 50° F. a compression joint was formed by placing a strip of heavy deadening felt, 2 ft. wide, on the end of the completed section next to the face and covering the remainder of the end with two ply of the felt and pitch water proofing; the one ply of deadening felt near the face was about the same thickness as the two ply of water proofing, and was used to prevent the pitch from being squeezed out of the joint to the face of the wall.

The excavation for the retaining walls in 31st and 33d streets was in all cases made of sufficient width to receive the sewers, which were laid as soon as the back-fill, carefully rammed and puddled, had reached the proper elevations; the back-filling was then completed, and the gas and water mains were afterward laid in separate trenches.

The sections of concrete built in trench varied in height from 13 to 59 ft. from the base to the top of the back wall. With the exception of the 7th Ave. wall, 50 ft. in height, and the 9th Ave. wall, 62 ft. in height, none of those sections constructed by the bench method was more than 14 ft. The forms and bracing for these walls were substantially the same, except that the low walls were built in lengths of approximately 50 ft., while the forms for the 7th and 9th avenue walls were only 20 ft. long.

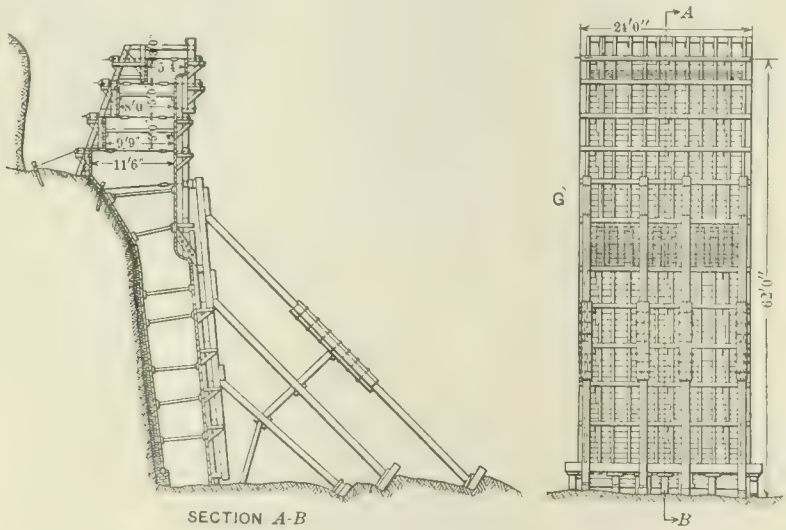

Fig. 3—Sketch Showing Forms and Bracing for Ninth Ave. Retaining Wall.

The forms and bracing for the 9th Ave. walls are shown by Fig. 3. These forms were built in one piece and moved ahead from section to section, and they were firmly braced from the bottom with raker braces to a point 36 ft. above the base, the upper part being held in place by ¾-in. bolts passed through the forms and anchored by cables to bolts grouted into the rock behind.

After the forms had been set and braced, an 8-in. brick wall was laid up the face of the rock, containing a vertical line of three-cell hollow tile block every 5 ft. of length, and laid to conform as nearly as possible to the face of the rock, all voids being filled with broken stone. Water proofing similar to that described for the walls in the trench was then applied to the brick and tile wall for the full height, and firmly braced to the front forms, the braces being removed as the concrete reached them. The concrete was mixed at the street level and deposited through chutes, as described previously.

The Wacanaw Lumber Co. of Bolton, N. C., which has 10 miles of railroad in operation, is reported to be considering extending the road from Makota to Southport, a distance of 20 miles.

Some Experiments on the Cost and Durability of Cement Drain Tile.*

Since the Ontario Agricultural College began College Extension work on the subject of Farm Drainage some five years ago there have been numerous inquiries for information on the subject of cement tile. People usually wanted to know two things, first, whether the cement tile could be made cheaper than the clay tile, and second, whether they would be durable. When these inquiries first began to come in there were not, so far as I am aware, any extensive or conclusive data as to the durability of cement drain tile, nor was there any grave question about their durability. There was a general impression, however, that they should prove durable, judging from the manifold conditions in which concrete had proven its usefulness. Therefore, at first we concerned ourselves with the cost of manufacturing cement tile by hand, for the point made by most of the inquirers was that they were thinking of procuring molds and making their own tile.

For use in our experiments on the cost of manufacture, the London Concrete Machinery Co. furnished us with one of their two-piece cement tile machines, since taken off the market. And the experimentation was undertaken by Mr. A. M. Shaw, one of our students, who had had considerable experience in cement work with his father, the late Mr. Robert Shaw, of Niagara Falls, Ont., who for several years did much of the road contracting in his locality. During the months of April and May, 1908, experiments were conducted in making cement tile.

While writing the report of these experiments in the latter part of the year we learned of the controversy over the durability of the cement drain tile, and we must confess that the ideas of cement being soluble was a new one to us. After reading the attack on cement and the answer to it we counselled our farmers to go slowly in the adoption of cement tile, believing that the uncertainty in our own minds at least about their durability was sufficient to warrant such action. At the same time, however, we decided to conduct some tests in order to learn for ourselves something about the solubility of cement, and to deduct from the information thus obtained some idea of the probable durability of cement tile. Those experiments were begun in February, 1909, and have been continued until the present. Besides the points already mentioned the porosity of cement tile received some attention during our experiments.

The Cost of Making Cement Tile by Hand.—The tile made by the London two-piece machine were hexagonal on the outside, being ¾ in. thick in the thinnest part and considerably thicker at the corners. Mr. Shaw found that, mixing his own material, he could make a shade over 500 complete 3-in. tile a day when everything was once in order. The material had to be mixed quite dry in order that the molds might clean, so dry, indeed, that it was impossible to tamp it close enough to make a compact tile. By oiling the molds it was found that the material might be mixed much wetter, but still not wet enough to make what we consider a good tile. We also thought that considerably more material was used in the tile than would be necessary for a round tile; and besides, the amount of handling required for two-piece tile was double that for one-piece. These features led us to doubt whether this type of machine would ever be popular with the farmers. On consultation with the company we found that they had arrived at the same conclusions, and that they were withdrawing the machine from the market. These circumstances at first led us to think that the work done on this phase of the problem was of little practical value, and we discouraged the extensive publication of the results, although we placed them in our annual report, just as a matter of record. On second thought, however, we have changed

*A paper by Prof. W. H. Day, Ontario Agricultural College, Guelph, Ont., read before the Canadian Cement and Concrete Association.

our minds somewhat, for the following reason: The rate of manufacture determined must represent fairly well what might be expected with a round-tile machine of similar dimensions—the round tile would be slower to tamp but there would be only half as many pieces to handle. And as a matter of fact we have since learned of a hand machine for round tile, recently invented, on which one man can make about 500 tile a day, thus establishing that the rate of manufacture determined in our experience is in all probability a fairly representative one.

We found further that 6 cu. ft. of sand and 1 bag of cement (approximately a cubic foot) would make 78 complete 3-in. tile. But a round tile ½ in. thick requires only 55 per cent as much material as the one made on the London two-piece machine, hence the material mentioned above would make 100.55x78 or 142 tile, providing they were tamped to the same compactness. As they could be made wetter they would likely be somewhat more compact. This, however, would be counterbalanced by the use of another half bag of cement making the proportions 4 of sand to 1 of cement (too poor for really strong tile), so that we may fairly see from our figures that 6 cu. ft. of sand and 1½ bags of cement there can be made 142 3-in. tile, say 140 in round numbers. This gives us a means of arriving at an estimate of the cost of making 3-in. tile, ½ in. thick by hand, when the price of material is known. In Guelph we pay $1 a yard for sand and $1.90 for cement. At these prices:

6 cubic feet of sand cost	$ 0.22
1½ bags of cement cost	0.71
Total price of material for 140 tile	$ 0.93
Total price of material for 500 tile	3.32
Wages of man for 1 day	2.00
Total cost of 500 tile	$ 5.32
Total cost of 1,000 tile	$10.64

In this estimate no allowance is made for hauling the material, as this can be offset against the hauling of clay tile, if it is desired to make a comparison between the cost of the two kinds.

The prices used in estimate may be high in some localities, but knowing that 6 ft. of sand and 1½ bags of cement will make 140 tile and that a good man can make about 500 tile a day on certain types of machine the cost of manufacture may be figured out to suit cost of materials in various localities. Or again, if type of machine is such that a man can make only 400 instead of 500 in a day the cost of the tile can readily be calculated. Next we come to the solubility tests.

Experiment I.—Sample, a piece of tile weighing 43.256 grams, after being dried to constant weight at 215° F. This tile was made by the "dry process" in April, 1908, in proportions 6 of sand to 1 of cement. For a few days after being made it was watered daily, and then it was submerged in water for a period of six weeks, after which it was removed and transferred to a storage cellar, where it remained until solubility experiments began. Tile quite porous. After the small piece had been dried to constant weight it was placed in distilled water for four days, then removed, dried, weighed, and again placed in fresh distilled water. As convenience allowed it was dried, again weighed, and once more placed in fresh distilled water. This was repeated 16 times, the total period of solution being 148 days and the total loss in that time was 0.113 grams. The total cement in the sample was 7.1794 grams, hence at this rate the cement would all dissolve in 27.7 years. The experiment was next performed with water from the artesian wells at the College. This water is high in total solids, about 460 to 480 parts per million, made up chiefly of bicarbonate of calcium, bicarbonate of magnesium, or the compound bicarbonate of calcium and magnesium. There is also a small amount of chlorine in it. The sample was tested five times in this water, the total period of solution being 47 days and the total loss in weight .090 grams. At this rate it would take only 10 years to dissolve all the cement in the sample.

Experiment II.—Sample, a piece of tile, proportion 6 to 1, made on London two-piece machine May, 1908, watered daily for a week after making, stored in cellar till November, 1909, mixed much wetter than sample used in experiment I, so wet, indeed, that the molds would not clean well. Dry weight 43.213 grams. The treatment was the same as in experiment I, only the number of tests in distilled water numbered 8 instead of 16, the total period in the water being 73 days. During the period the sample lost .025 grams, at which rate it would take 57.4 years to dissolve all the cement in it. When put in the well water the loss in 47 days was .090 grams, which rate would use up all the cement in 10.3 years.

Experiment III.—Sample, a piece of wet-mixed tile, made the same time as No. 2 and watered and stored in the same way. Dry weight 36.2795 grams. Treatment, distilled water for 73 days, well water for 47 days. This sample lost only slightly in distilled water and gained .0333 grams in well water. At this rate it would last for ever.

Experiment IV.—Sample, a piece of tile, proportions 4 of sand to 1 of cement, made by Mr. George Holden, of St. Marys, on the London Automatic cement tile machine. Watered daily for a week after being made, and then stored in our laboratory until October, 1909. Dry weight 20.4792 grams. Treatment, same as II. and III. Loss in distilled water in 73 days = .0387 grams. At this rate the sample would last 26.5 years.

Experiment V.—Sample, a piece of tile, proportions 4 of sand to 1 of cement, made by same maker as No. II, cured and stored in the same way. Dry weight 35.781 grams. Treatment, same as others. In 73 days in distilled water the loss was .0175 grams, at which rate the sample would last 102.2 years. In 47 days in well water the sample gained .0165 grams in weight, and thus would never disintegrate.

Experiment VI.—Sample, a piece of clay tile, about average quality, possibly burned a little slack. Dry weight 36.660 grams. Treatment, in distilled water 48 days, weighed 5 times in well water 47 days, weighed 5 times. Loss in distilled water 1.159 grams, at which rate the sample would last only 9.1 years. Loss in well water .081 grams, at which rate the sample would last 58.3 years.

In estimating the time that samples would last it has been assumed that they would be subject to solution 365 days in the year and that the rate of solution would be uniform. The first of these conditions certainly would not hold in practice. During a large portion of the year, possibly half, tiles are dry and not subject to solution, and consequently would last twice as long as the periods mentioned, provided the rate of solution during the other half of the year was constant.

We had hoped to establish something definite as to the rate of solution, but we have failed to do so yet. The rate of solution seems to fluctuate with some factor other than time, probably temperature. Just when our curve for rate of solution would reach a constant for two or three readings, this variation would occur and prevent conclusions. In all samples the rate of solution in distilled water appeared to fall off, slowly in most cases, but very rapidly in a few, especially in the case of the clay tile. When placed in the well water the samples all behaved irregularly at first, giving either large losses or else large gains, and these losses or gains fell off rapidly.

Three other experiments were performed which probably come nearer natural conditions than the previous experiments do. Three half tiles were placed in running well water on May 6th, 1909, where they have been ever since. At the end of six months they were dried, weighed, and replaced in the water. Then last week they were dried and weighed again. The results are as follows:

Experiment VII.—Sample, a half tile, proportion 6 to 1, made on London two-piece machine, dry process, May, 1908, watered for a week, stored in cellar. Dry weight 1797.5 grams. Treatment, in running well water for 10½ months, weighed at 6 months and at 10½ months. Result, tile gained in weight each time. Total gain 3.4 grams.

Experiment VIII.—Sample, same as in 7. Dry weight 1910.25 grams. Treatment, same as 7. No change in weight in first 6 months, a gain of 4.05 grams in next 4½ months.

Thus these two samples would never disintegrate at this rate.

Experiment IX.—Sample, a half tile, proportions 6 to 1, made on London two-piece machine, made very wet, so much so, indeed, that tile would not hold shape, and molds would not clean. Allowed to dry, getting a few showers of rain, and then stored in cellar. Dry weight 2001.0 grams. Treatment, same as in 7 and 8. Tile lost 1.90 grams first 6 months and 2.7 grams next 4½ months. At this rate the sample would last 63.4 years.

It is worthy of note with regard to these three samples that those made by the dry process, and therefore very porous, were the ones to gain in weight, while that made by the wet was the one to lose.

The behavior of these three large samples contrasts so strangely with that of the small samples as to indicate that experiments with small pieces are apt to be very far from actual conditions. For instance the rate of solution for the piece of clay tile would indicate that that sample would all dissolve in less than two generations. And in much less time than that the tile would be so weak as to give way under soil conditions. Experience has shown that such does not occur, and hence we must conclude that the conditions are so artificial that it is not safe to base arguments as to durability upon such tests. It is even doubtful whether the large tile in running well water is very close to natural conditions. In the soil there will be much very fine sediment in the form of clay and colloid particles to lodge in the pores and prevent solution. The process of accretion shown in two out of three of these large samples would doubtless be much more rapid in the soil. Another reason for the slower solution in the large samples was the cooler temperature maintained by the constant introduction of cold water. Basing our conclusions on these larger samples we are not able to see any danger of the cement tile crumbling.

It is our intention to continue the work on the solubility, as we realize there is much yet to be learned about it.

Porosity.—With regard to the porosity we find that it varies with the proportions of cement, with kind of sand used, and also with the method of making. The more cement used, the finer the sand, or the wetter the mix, the less porous the tile. But even the most compact ones tested were much more porous than clay tile.

Asphalt Grouted Sewer Pipe Joints.—In some of the German cities sewer pipe joints are made by grouting in asphalt. The pipes, which must be absolutely dry and clean, are placed in position, and strands of tarred jute are caulked into the joints, then a band of clay puddle is fixed around the pipe against the annular space for the jointing material and natural asphalt melted to a temperature of about 380° F. is poured through an opening made in the clay band at the top part of the pipe. According to the Municipal Engineer of Elberfeld, Germany, the asphalt must be very fluid and free from impurities, which might cause bubbles to form, and the melting tank must be kept closed to prevent the escape of the light volatile oils. Artificial asphalt made of tar compounds has been found to be unsuitable. The quantity of material used is as follows:

Diam. pipe (in.)	4	6	9	12	15
Tarred jute (lb.)	0.5	0.66	0.82	1.43	2.20
Asphalt (lb.)	1.43	1.98	2.92	4.62	6.76

After completion the sewers are tested by an air pressure of from 3.7 lb. to 5 lb., which is maintained for ten minutes.

The pipes are usually made in lengths of 1 metre, and it is found that the cost of the sewers is decreased by reason of the fewer number of joints. Pipes over 18 in. in diameter are usually surrounded with concrete.

An Analysis of Concrete Bridge Failures.*

The opponents of concrete have in the past hailed every case of failure in concrete construction as an additional demonstration of the entire unsuitability of the material for strong and permanent engineering works. In order to ascertain the ground, if any, on which the representations of the opponents of concrete bridges are based, the writer has looked into the cases of concrete bridge failures of which he could obtain reliable information pointing to the cause of failure. The data thus collected are presented below in as concise a form as possible consistent with a full statement of the circumstances in any way likely to aid in placing the responsibility. Some attention is given to cases of pronounced cracking of spandrel and wing walls, since such developments, while not incapacitating the bridge for present traffic, constitute failure to the extent of impairing the bridge aesthetically if not materially shortening its life. From this evidence the cause of failure (complete or partial) is deduced in each case and a summing up of the cases is presented at the close of the paper.

Fig. 1—View Showing Abutment of Concrete Bridge After Collapse of Girder Span.

Case 1.—Reinforced-concrete slab or flat-top bridge of 10 ft. span intended to carry a fill of 13 ft. above the top of the slab; slab, 12 ins. thick reinforced by longitudinal rods ¾ in. in diameter spaced 12 ins. c. to c., and transverse rods of the same size 2 ft. c. to c.; spandrel walls, 2 ft. thick at the bottom reinforced by vertical ¾-in. round rods, 2 ft. c. to c.

After the concreting had been completed nearly two months and some 10 ft. of the earth fill had been placed, the centers were struck with the result that almost immediately the slab collapsed under the weight of the fill alone, leaving the spandrel and wing walls intact as shown by Fig. 1.

An examination of the wrecked structure at once directed suspicion to the design rather than to the materials or workmanship. The concrete was apparently of correct proportions, had set satisfactorily, and had evidently been placed with care. Computations based upon measurements of the slab taken after the failure showed a fibre stress of 41,500 lbs. per sq. in. in the steel and 1,100 lbs. per sq. in. in the concrete under a 10-ft. fill. Apparently, no special care had been taken properly to anchor the longitudinal reinforcing rods, so that under this stress, considerably in excess of their elastic limit, they had pulled through the concrete, as was evidenced by the polished state of the concrete in contact with these rods. The failure can therefore be attributed wholly to defective design.

Case 2.—This structure, which is typical of a number of reinforced-concrete girder bridges completed in a county in the State of Indiana some 3½ years ago, was of span 15 ft. in the clear and 16 ft. clear roadway. Two longitudinal girders 15 ft. 10 ins. c. to c. carrying a 7-in. slab comprised the superstructure. Upon this slab was placed a 12-in. earth fill and in addition it was supposed to carry a uniformly distributed load of 200 lbs. per sq. ft. or a 20-ton road roller. The slab was reinforced by tranverse rods of a sectional area of 0.78 sq. in. each, 1 in. from the bottom and 10 ins. c. to c. and by longitudinal rods ½-in. in diameter and about 3 ft. on centres.

Before the striking of the centers, Mr. Daniel B. Luten, President of the National Bridge Co., in a communication to *Engineering News*, pointed out the weakness of the design and questioned its safety. He showed that under dead load alone the compression in the concrete of the slab would be about 1,000 lbs. per sq. in. and the tension in the steel would be nearly 20,000 lbs. per sq. in., while for the specified live load consisting of a 20-ton roller these figures became 3,000 and 55,000 lbs. per sq. in. respectively.

Before Mr. Luten's letter had appeared in the journal mentioned, startling confirmation of his deductions was given by the collapse of the bridge under a traction engine the day following the removal of centres. From the testimony of the engineer in charge of the engine, the bridge gave way when the rear wheels were about in the centre of the span, and indications pointed to the slab as the initial source of failure. Careful examination of the wrek disclosed no broken steel and failure was apparently caused by excessive compression in the concrete of the slab. Under the loading of the traction engine, which weighed about 16,500 lbs. and of which 9,000 lbs. were concentrated on the rear axle, this compression could not have been less than 1,800 lbs. per sq. in., with the tension in the steel about 32,500 lbs. per sq. in. The corresponding stresses in the girders were about 1,000 lbs. per sq. in. for the concrete and 20,000 lbs. per sq. in. for the steel. The compression in the concrete of the slab was therefore nearly equal to the ultimate strength of a good concrete one month old, and in excess of the strength of the material used, which appears to have been of poor quality—on account of the presence of "dirt" in the sand. Very bad design and lack of care in preparation of the concrete were, therefore, clearly responsible for the collapse.

Case 3.—Reference has been made to a number of girder bridges similar in design to that of Case 2, constructed during the same year as the latter, in the state of Indiana. One of these of 24-ft. span developed a bad crack in one of the beams shortly after the striking of the centers, but managed to hang together and carry the traffic for about 1½ years. There was no load on the bridge when it finally fell and no evidence could be discovered of any weakening or undermining action from floods or other causes. It, therefore, appears that its downfall, like that of its companion in disaster, was due to the errors of an inexperienced or careless designer.

Case 4.—Plain concrete railroad culvert of 20 ft. span and 10 ft. rise, carrying a fill of about 10 ft. over the crown; crown thickness about 18 ins.; foundations were carried 4 or 5 ft. below the natural level of the ground. The situation of the bridge was on marshy soil and the foundation-bed was of soft clay with considerable organic matter present, *but no piles whatever were used.*

As the filling was placed on the arch, cracks began to develop, in the case of the west wall, passing vertically up the wing walls near

Figs. 2 and 3—Views Showing Concrete Arch Cracked by Settling of Foundations.

*A paper by C. R. Young, of Barber & Young, Bridge and Structural Engineers, Toronto, Ont., read at the convention of the Canadian Cement and Concrete Association at London, Ont., March 30, 1910.

their junction with the spandrels, then crossing this corner and trending to the crown of the arch, reaching it at about one-quarter of the length of the barrel in from the face of the spandrel walls (Figs. 2 and 3). In the east wall a large vertical crack passed from

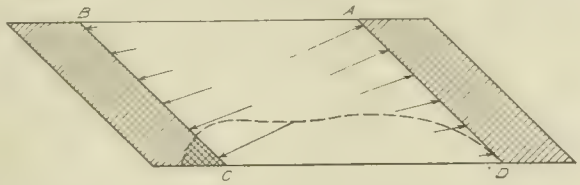

Fig. 4—Diagram Showing Cause of Failure of Concrete Skew Arch.

the footing up the soffit to near the crown, where it joined a large horizontal crack running along nearly the whole length of the arch barrel. In addition to these very prominent cracks many other tributary cracks of lesser extent developed.

Careful examination of the cracks in conjunction with the originally level mold board lines conclusively showed that the abutments had settled from 4 to 6 ins. under the heavy load of the fill, and that the insecure foundations were wholly responsible for the failure.

The writer is indebted for the above information to Mr. F. L. Somerville, M. Can. Soc. C. E., under whose observation this failure came, but who was in no way responsible for the design or construction of the bridge.

Case 5.—A plain concrete railroad culvert 10 ft. in span carrying an embankment 52 ft. in depth, was constructed in the winter. The foundation-bed was of soft clay and no piles were used. In the following spring when the frost came out, a portion of the barrel near the middle collapsed under the weight of the fill and a part of one end with one of the wing walls gave way under the sliding of the embankment.

The explanation offered for this failure, and one that appears reasonable, was that the spring thaw had destroyed the even bearing of the culvert on the foundation-bed and that the barrel had thus been resolved into a beam at several points, the wrecked end portion acting as a cantilever. Had reinforcement been used, which is particularly desirable in winter work of this class, the structure would no doubt have safely withstood the adjustment.

Case 6.—A reinforced-concrete arch highway bridge of about 30 ft. span and of low rise was constructed with abutments resting directly upon a quicksand bed and in a situation involving the excavation of a new channel for the stream. Shortly after the striking of the centers the arch ring collapsed, although subsequent computation showed the design to be sufficient.

While the early removal of the forms may have been to a small extent responsible for the failure, the excavation for the new channel appears to have immediately precipitated the fall. Under the considerable weight of the arch, and favored by the removal of material between the abutments, lateral flowing of the quicksand with attendant settlement and tilting of the abutments naturally followed. Had the foundation-bed been piled, this development could not have taken place. Faulty design of foundations was, therefore, primarily responsible for the failure; but, unless some of the piles had been driven on a batter, bad cracking of the spandrels would have occurred under the conditions named.

Case 7.—Some seven years ago a Monier arch of considerable size and built at an extreme skew, collapsed at Bendigo, Australia, with loss of life. The failure was sudden and unattended by any premonitory signs of distress, unlike the recorded character of failure of Monier arches, which had been tested to destruction in Europe and elsewhere. In view of the fact that the abutments were especially massive and securely founded on solid rock and that the materials were excellent, the contractor attributed the disaster to incorrectness in the received theory of skew arches, and retained the services of the late Professor W. C. Kernot, of the University of Melbourne, to conduct a thorough investigation and report upon the cause of failure.

By means of measurements of the deformation of loaded India rubber models and by ingenious electrical experiments on a metallic model, corroborated by mathematical calculations, Professor Kernot was able to show that Rankine's theory of the skew arch, which had

Fig 6—View of Crack in Spandrel Wall of Arch Represented by Fig. 5.

up to that time been universally accepted, was altogether erroneous. Rankine's view, as stated in his "Applied Mechanics," was that "the forces which act in a vertical layer or rib of a skew arch with its abutments, are the same with those which act in an equally thick vertical layer of a symmetrical arch with its abutments, of the same dimensions and figure, and similarly and equally loaded." It followed from this assumption, therefore, that the design of a skew arch in no way differed from the design of a right arch of the same span as the span of the former, measured parallel to the longitudinal axis of the bridge. Professor Kernot, however, conclusively demonstrated that there is a great intensification of stress along the short diagonal *AC* of a skew arch (as indicated by the arrows in Fig. 4), the actual stress being almost double the stress along lines parallel to *AB*. At the same time the stress along the long diagonal *BD* was excessively small.

The existence of such a stress condition is particularly serious since the acute angles of the abutments are of insufficient mass properly to resist the augmented thrust in the direction of the short diagonal, and if the skew be large, the factor of safety low or the test load unusually heavy, the abutments may give way at these points. This is precisely what happened at Bendigo, for the acute angle *C* of one of the abutments was literally pulverized over the double-hatched portion by the local intensification of the stress, and the part of the arch enclosed by the irregular dotted line and the line *CD* had consequently fallen.

The cause of this failure lies unquestionably in the lack of knowledge at that time of the true principles of proportioning skew arches and their abutments.

Case 8.—The most recent concrete bridge failure of magnitude occurred on Feb. 28, 1910, when a reinforced-concrete arch highway bridge of three spans over the Flat Rock River near Edinburg, Ind., collapsed during a flood of exceptional height. The bridge had been open to traffic for about eight months and during that time had stood one severe flood, accompanied by an ice jam.

As designed, the structure consisted of one central span of 90 ft. and two side spans of 75 ft. each, all foundations to be on piles. Although the design was submitted by a well-known and responsible concrete bridge company, the County Commissioners decided, with the wisdom born of inexperience, to save money by omitting the piling and carrying the piers and abutments down to a somewhat greater depth than originally contemplated. Beyond furnishing the design, which appears to have been entirely satisfactory with the possible exception of insufficient provision for flood waters, the bridge company had nothing to do with the work, and the County Commissioners for whom the bridge was built had no engineer to advise them or supervise the construction. In spite of this, and to the credit of the contractor, the materials and workmanship were of excellent quality, many of the particles of stone and gravel of the concrete having split instead of being torn out of their place by the collapse.

Upon careful examination of the wreck it was found that the scour actuated by a considerable quantity of lodged drift had undermined the upstream end and one side of one pier, causing it to tip forward and endwise, and resulting in the fall of the two arches which it carried. The other pier being thus left without support to counteract the thrust of the remaining arch, likewise tilted, allowing this span to drop vertically into the river. There was no evidence to point to any other cause of failure than undermined foundations,

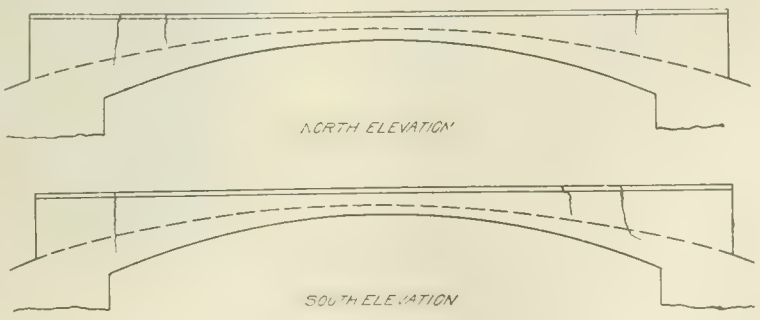

Fig. 5—Sketches Showing Cracked Spandrel Walls.

and the responsibility for this rests with those who altered the original plans and specifications.

Case 9.—The most extensive failure in reinforced-concrete bridge construction of which records are available is that of the City Bridge across the Illinois River at Peoria, Ill. On May 1, 1909, three spans and the two intermediate piers of a six-span arch structure, which had been opened to traffic only a few weeks, collapsed before the supporting centers had been struck. The wrecked spans were each Melan arches 125 ft. in the clear, of 13½ ft. rise, and of the solid spandrel type. Practically all of the earth filling was in place at the time of failure. The two ruined piers were specified to be founded upon piles driven to bed rock, though subsequent investigation showed that probably most of the piles stopped at less stable material. In addition, the piles were to be enclosed by permanent water-tight tongue-and-groove sheet-piling or Wakefield piling to safeguard the pier foundation against scour; but, in spite of repeated warnings on the part of the consulting engineers, this was not done, nor was any protection in the way of riprapping provided by those directly in charge. As a result, during the high water of the spring of 1908, the scour was most serious, in the case of one pier reaching to 3.8 ft. below the base of the pier, or 11 ft. below the original bed of the river.

Since the design and construction of the superstructure was apparently entirely satisfactory, it was, therefore, not difficult to assign the cause of failure. The lateral support and the frictional resistance of the piles under the two piers in question having been largely removed by the excessive scouring action of the water, buckling and considerable settlement would naturally follow. This action was no doubt largely precipitated by a serious settlement and movement in a shoreward direction of one of the abutments, which began a year prior to the collapse of the structure.

Under such circumstances, there is little doubt that the cause of failure was insecurity of foundations.

Case 10.—This is not a case of total or even partial collapse, since the bridge in question has been in constant service since its completion some two years ago. It affords, however, an excellent example of spandrel wall cracking, and as such will be used to illustrate a general discussion of this defect, which, as has already been stated, constitutes failure to a limited degree.

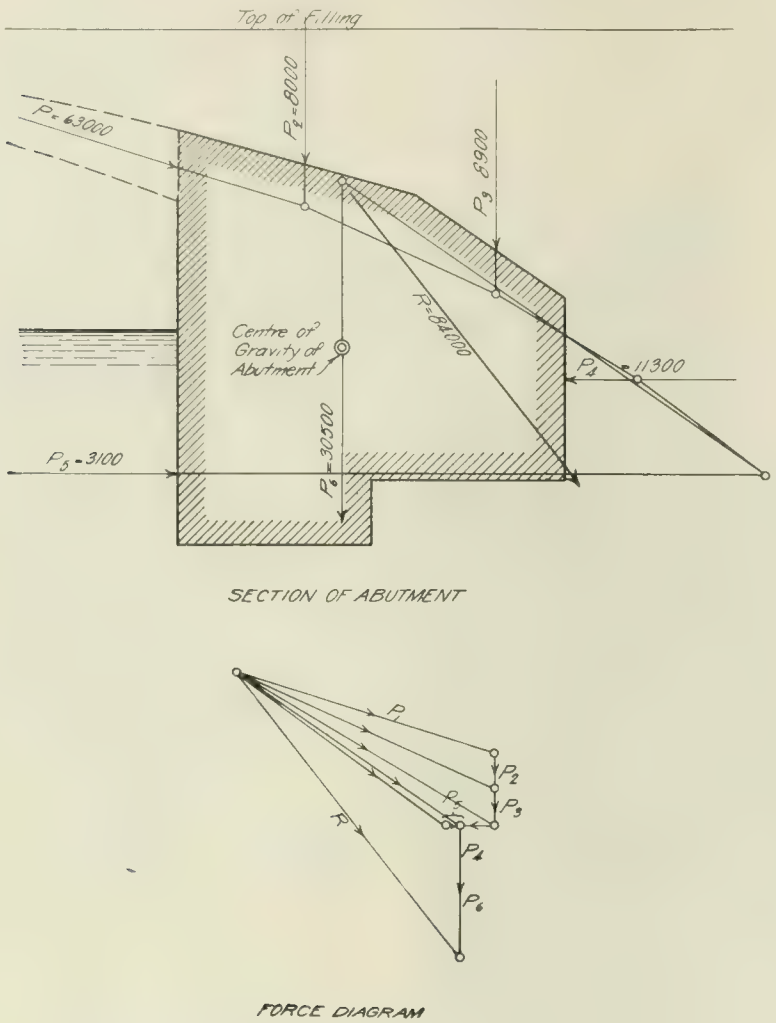

Fig. 7—Diagram Showing Cause of Spandrel Wall Cracks Shown in Fig. 5.

This bridge, having a span of 60 ft. in the clear, a rise of 6 ft. and a crown thickness of 15 ins., developed pronounced cracks in the spandrel walls, as shown by Fig. 5, immediately upon the striking of the centers, although the spandrels are reinforced in the region of the springings by three longitudinal ¾-in. round rods. One of these rods is in the coping and the others are located at distances of 1 ft. and 3 ft. below it. Each of the abutments rests upon a large number of vertical piles driven into quicksand.

The conspicuous character of the cracks is evident from Fig. 6, giving a photographic view of one of them in the southeast spandrel wall. In this case the crack passes well into the ring, although not as far as the one in the southwest spandrel, which reaches practically to the center of the ring, as shown in Fig. 5.

With the object of explaining the existence of these cracks in spite of the longitudinal reinforcement in the spandrels, the writer obtained information concerning the dimensions of the abutments and constructed the diagram shown in Fig. 7. In this diagram the various forces acting upon the east abutment are shown in magnitude, direction, sense and point of application for a vertical longitudinal rib or strip, 1 ft. in thickness. The thrust of the arch P is given for the weight of the arch ring and filling only, since the spandrel cracking occurred without any live load on the span. $P2$ and $P3$ are the weights of the two trapezoidal prisms of filling resting on the abutment; $P4$ represents the lateral pressure of the earth filling acting on the vertical projection of the abutment and tending to force it forward into the stream; $P5$ is the pressure of the water and the saturated material of the stream bed, acting on the face of the abutment, and $P6$ is the weight of a strip of abutment 1 ft. thick reduced for buoyancy of the submerged portion. These various forces, when combined, produce a resultant action, R, on the base of the abutment having a magnitude of 84,000 lbs. and passing altogether outside of the base instead of cutting it near the center, as it should in a properly designed abutment.

With the aid of Fig. 7, the spandrel cracks in this arch are, therefore, not difficult to explain. If the abutment were merely a simple block of masonry acted upon by the forces indicated in the diagram, with no others operating, it would overturn about the lower right hand corner; but, the presence of the spandrel walls with their reinforcement supplies sufficient resisting moment to preserve equilibrium, although not without overstressing them and causing the very pronounced cracks indicated.

Fig. 8—View Showing Typical Breaking Away of Wing Wall.

Apart from the obvious effect of this se-

rious error in the design, it is probable that spandrel cracks would have still occurred, although not to the same extent, as shown in Fig. 5. The abutments, as has been noted, were founded on vertical piles driven into quicksand, and under the thrust of the unusually flat arch lateral yielding of the piles would in all probability have been followed by cracking of the spandrels. The practice of founding arch abutments on piles, none of which are driven on a batter, or where no abutment ties are employed, is in the majority of cases likely to result in unsightly or dangerous cracks.

Spandrel cracks are so often found in concrete arches that their presence cannot always be attributed to badly designed abutments or to yielding foundations. The writer knows of one case where spandrel cracking occurred in an arch the abutments of which were founded upon solid rock and where, it is believed, the design was in general satisfactory. The spandrels, however, contained no longitudinal reinforcement, and the settlement of the crown when the centers were struck had induced sufficient negative bending moment in the spandrels near their junction with the abutments to overcome the tensile strength of the concrete and cause conspicuous cracking. In all probability no such development would have taken place if the spandrel walls had been well reinforced, certainly not with properly designed arch ring and abutments.

The objectionable practice of inserting gas pipe or other metallic hand-rail posts in the spandrels of arches, strongly favors the development of spandrel cracks. Since the temperature of the exposed metal rises more rapidly than that of the concrete under the heat of the sun's rays, the posts expand more rapidly than the concrete and cause cracking of the latter at every post, which apparently increases with time on account of the swelling action of the rust at the surface of the spandrel wall.

Case 11.—The badly cracked wing wall shown in Fig. 8 is typical of a great number of like cases which exist throughout the country. Such a development does not, of course, put the bridge out of commission; but it necessitates the expense of shoring and repairs and at the same time provides a never-failing stimulus for remarks uncomplimentary to engineers. The source of the trouble is generally in bad design, and sometimes in careless workmanship. In this case, the wing wall is about 24 ft. high, 3 ft. thick at the base and 18 ins. at the top, *with no reinforcement whatever.* The workmanship and materials were good and the failure is, therefore, entirely due to the absurd proportions of the wall. A number of cases of cracking of correctly designed wing walls at their junction with abutments are known to the writer, where trouble might have been avoided by a small amount of horizontal reinforcement at the corners.

Conclusion.—Summing up the eleven cases cited, the principal, and therefore primary, causes of failure are found to be as follows:

Causes of Failure.	No. of Cases.
Design of foundation originally defective or rendered defective by alterations not approved by the designing engineers	6
Design of superstructure defective	5
Total	11

It therefore appears that in the cases discussed over one-half of the failures occurred from defective design of foundations. Especially significant is the fact that in the case of the two most extensive failures described, the original designs and specifications for the foundations were satisfactory and that the disastrous results were caused by alterations in the plans, made by persons in authority without professional advice. The time is coming when engineers in self-protection will refuse to allow their plans and specifications to go out and suffer interpretation and alteration by laymen, but will insist upon the same expert attention to the work under construction as in the designer's office.

A feature of the above tabular statement which may occasion some surprise is the fact that in all of the cases considered failure was primarily due to errors in design, either of sub-structure or superstructure, and that the material, except to a limited degree in Case 2, was not in any way responsible for the unfortunate results.

It is perhaps unnecessary to remark that no special selection of cases was made for the purposes of this paper, but every case has been included concerning which reliable data could be obtained in a short space of time. Since these cases are probably typical of most of the failures of concrete bridges, there does not appear to be any ground for the disquieting statements which have been made by interests antagonistic to concrete with the object of discouraging the use of a material in engineering works.

Some Methods of Water-Proofing Concrete Structures with Results from Practice.

There are few classes of work where the waterproofing of concrete structures has elicited more attention than railway work. Practice here is quite as various and fully as unsettled as elsewhere, as is evidenced by a recent report of the committee on masonry of the American Railway Engineering and Maintenance of Way Association. Many useful data are contained in the replies of various railway engineers to the circulars issued by this committee and we present in abstract such of them as seem of most general interest.

The following is extracted from a letter by Mr. Hugo Schmidt, division engineer, Chicago City Railways Co. His deductions are based on experiences in large car barn con-

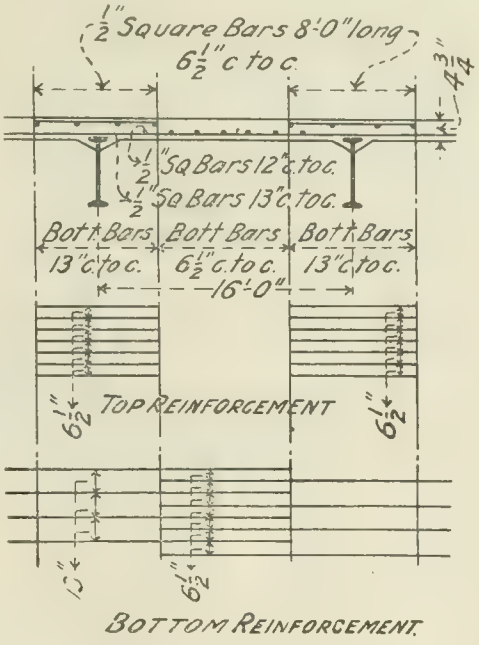

Fig. 1—Original Reinforcement of Car Barn Roof, Chicago City Railways.

struction in the city of Chicago. He says in part, in reference to the waterproofing of the roofs over these barns:

My conclusion is that reinforced concrete roofs for car house purposes can be designed sufficiently waterproof without the use of a waterproof covering. This necessitates a careful proportioning of the steel reinforcement, a distribution of the steel taking care of all the live and dead loads being a solution of only the easier part of the problem. Our design as per Fig. 2, while being an improvement over the work previously done, does not entirely solve the problem. The cost of extra steel required for this purpose should not be as high as the cost of a waterproof covering, and if the workmanship can be carefully supervised, a roof of this kind should require no such maintenance expense as is necessary with all common roof coverings.

The roofs of these buildings were intended only to shed rain water and absolute watertightness was not required, so that as an example of waterproofing methods they are hardly applicable to waterproofing in general. The methods used and results obtained are, however, of interest. Figure 1 shows the design previously used. The buildings constructed after Plan 1 are about three years old. The total roof area is something over 3 acres and is practically watertight. The worst leaks are found at places where down-spout headers are set into the slab. Only two instances were noted where leaks occurred at joints between different days work. This is accounted for by the fact that where possible in all cases joints were made at the centers of spans so that the deflections of the roof slabs would tend to close the joints on top. You will note in Fig. 1 that the top reinforcing bars all stop at the quarter point, also that two of the four bars supporting the top bars are located at the extreme ends of the top bars. A few months after completion it was found that characteristic cracks had developed on the top closely following the ends of the upper reinforcing bars. These cracks were found at about 25 per cent of the rods. Although only a few of these cracks allowed water to come through it was desired to secure a design with a more even distribution of materials near the top surface so as to eliminate as much as possible the effect of cleavage lines.

The newer car houses have roof slabs supported by reinforced concrete girders as shown by Fig. 2. In this case it will be noted that every third reinforcing bar is continuous along the top and the bars supporting the top bars are kept away as far as possible from the ends of the top bars. Although these roofs are only 18 months old it is evident that this is a substantial improvement over the old type. By this method cracks at the ends of the top irons have been almost entirely eliminated (in one car house measuring 265 x 420 ft. there were only two such cracks).

Mr. J. L. Campbell, engineer, maintenance of way, El Paso & Southwestern System, cites the following experiences in the use of waterproofing materials. The structures were four large concrete lined reservoirs carrying 12 ft. of water. They were made by excavation in the surface of the earth sufficient to raise embankments necessary to contain 12 ft. of water plus a margin of 2 ft. The earth so used proved to be unsuitable for reservoir work in that it shrunk and dissolved under the action of water. Consequently a great amount of trouble in the of settlement and cracks in the linings of the first two tanks in particular, in which the concrete was not reinforced, was encountered. Even in the last two reservoirs in which the lining was reinforced with ⅜-in. rods on 12-in. centers in two directions, there was a settlement at one point sufficient to produce small cracks, causing a leakage of 1½ ins. per day. The concrete lining is 4 ins. thick, made from a 1:2:4 mix, and covers approximately 160,000 sq. ft.

The materials used for waterproofing were soap, alum and asphalt. Two ounces of alum to 1 gal. of water and ¾ lb. of castile soap to 1 gal. of water were used, applying two coats of soap and two coats of alum alternately. This treatment rendered the concrete practically waterproof, there being no measurable leakage. As an extra precaution the reservoir linings were covered with as much pure asphalt as the surface would carry after the soap and alum had been applied. Of the results of this procedure Mr. Campbell says: "There is no measurable leakage through concrete waterproofed in this manner." A waterproofing material manufactured by the Elaterite Paint and Mfg. Co. was used on one of the reservoirs in place of asphalt with practically the same results.

The following method described by Mr. R. N. Begien, division engineer, Baltimore & Ohio R. R., is used to protect against rainfall in deck bridges over highways. Concerning the method of waterproofing used the following explanations were given: The material is tarred felt weighing 14 lbs. to 100 sq. ft. and American coal tar pitch; this was laid 6 ins. to the weather and the entire surface of each lap was thoroughly mopped with hot

pitch; after this covering was in place the whole surface was again coated with pitch.

No prediction was ventured as to the effectiveness of this waterproofing, the work having been done only recently. From previous experiences with roofing of this class it was judged that the life would be short owing to

the rotting of the felt, no matter how protected. From experience on other bridge work the idea was advanced that a finish of a mixture of 1 part cement and 2 of sand thoroughly applied about 1 in. thick will protect metal work and prevent leaks where reinforced concrete has been used, providing always that proper expansion has been allowed.

Some work similar to the above was done by Mr. O. E. Selby, engineer, bridges and structures, Cleveland, Cincinnati, Chicago & St. Louis, R. R. Eight ballasted bridges with waterproofed floors were built over streets in and about Indianapolis in connection with track elevation. In each case the floor was built of transverse I beams covered with a reinforced concrete slab about 4 ins. thick; on top of this was placed the waterproofing, which consisted of four or five layers of wool felt cemented with pitch or asphalt. Coal tar pitch in all cases except two.

Some idea of the effectiveness of this method may be obtained from the following observations taken since the completion. The West Washington St. bridge has been in service about two years and has no leaks whatever. The National Road bridge has five or six places where drops of water come through, mostly over the bents. The Kentucky Ave. bridge has about the same number of leaks similarly located. The Massachusetts Ave. bridge has more leaks than any other because this was the first one done, and details for joining the waterproofing to the girders and stiffners were not as good as those adopted later. Kentucky Ave. bridge, Chicago division, has a number of leaks sufficient to show white on the ironwork. These are the result apparently of the complicated nature of the details in changing from through to deck construction. At Kentucky Ave. there have been some leaks under the ends of the girders and floor, allowing water to run down the face of the abutment. This was not a serious matter, but was corrected later by carrying the waterproofing membrane down over the back of the abutment.

In Fig. 3 is shown the design of a waterproof bridge The plan shown here is being used in railroad bridge work by Mr. Robert Trimble, chief engineer, maintenance of way, Pennsylvania lines west of Pittsburgh. The structure shown (Fig. 4) is a steel trough bridge over the subway at Fifty-fourth place, Chicago. The troughs run parallel with the street and extend from abutments on each side to columns in the middle of the street. The length of the troughs is 27 ft. 3 ins.

The troughs are filled in with concrete to a minimum distance of 2 ins. above the top. The concrete is finished smooth and sloped so as to carry the water out from under the track to gutters along the sides. When possible the water is drained from the center toward both ends by putting in a summit. When this cannot be done the water is all carried to one end of the bridge. On top of this concrete floor five layers of Hydrex felt are placed; each layer overlaps the next by four-fifths the width of the felt. Each course is swabbed with swabbing material furnished by the Hydrex company, excepting the bottom layer; no attempt is made to furnish a bond between the concrete and the waterproofing material. The felt extends over both ends of the bridge and well down over the abutments. The felt is protected by a layer of concrete 2 ins. thick, the top surface of which is finished smooth.

This method is credited with giving the best results of any tried. The bridge is practically watertight, only two small leaks having occurred. These are near a column and along a girder. Bridges which have no columns are giving the best results, as the most trouble is experienced with cracks forming over the columns.

Some interesting observations on the use of waterproofing materials and the use of steel reinforcement in securing waterproof concrete structures were made by Mr. Chas. M. Mills. Basing his opinions on tests made by himself and from observations of the results of methods used on work, also in view of trials made with waterproofing materials compounded with concrete in mixing he advanced the conclusion that it is better to build a structure waterproof in itself than to build one and try to make it waterproof afterwards; that the elimination of the permanence of extraneous waterproof materials is very desirable, and the expense of securing a proper concrete mixture and of the necessary longitudinal reinforcement to give desired results is less than that of applying waterproofing.

The following description of methods used on the Market St. subway, Philadelphia, built by Mr. Mills, was given. The structure has walls of reinforced concrete, floors of concrete reinforced when necessary, and roofs either of reinforced concrete, concrete jack arches on steel beams, or reinforced concrete slabs on steel beams. Notwithstanding the fact that the ground water is tapped and pumped into sewers, the structure was designed to be waterproof, one reason being that at the time it was thought that the ground water might exceed the quantity that could be economically handled and that the drains would have to be closed. Where the backfilling contained clayey material the walls are under head, especially after heavy or protracted storms. Certain deep parts of the structure are under head permanently, being below the drains.

After observing the results obtained in the early part of the work, the use of waterproofing materials was stopped on all parts of the building except the roof. Reliance for water tightness was then placed on longitudinal steel rod reinforcement aided by making the concrete with a graded aggregate having an appreciable amount of fine material mixed wet and well spaded around the forms.

Three-fourths of 1 per cent of deformed steel bars was used on the latter part of the work with satisfactory results, since there is no leakage except in a few spots where bad joints were made in the walls, or where the work was otherwise defective. No expansion joints were made in the walls, and this quantity of longitudinal reinforcement distributed the shrinkage due to hardening and the contraction due to falling temperature, so the cracks are usually less than 1/100 in. wide, as found by measurement, and average about 40 ft. apart on typical wall. The cracks show a line of incrusted salts frequently, left by the evaporation of in-filtering water originally, and many are entirely clean. All are dry and have not at any time leaked in the usual sense of the word. Clay or silt has been carried in from the exterior and choked the fissures. A large increase in the percentage of longitudinal reinforcement could have been made and still have kept well within the cost of waterproofing, which involves expensive details and labor, in addition to the cost of waterproofing materials themselves and the direct application. A moderate increase in the percentage would reduce the fissures so that they would be scarcely visible, with corresponding increase in efficiency in water exclusion.

Fig. 3—Method of Waterproofing Bridge Floors, Pennsylvania Lines West of Pittsburg

All the roofs were waterproofed with rock asphalt mastic placed in two layers, each layer 1½ ins. thick. The results have been found satisfactory after five years' service on the part of the work finished first. When the roof consisted of jack arches on steel beams, steel mesh or small steel rods were used to prevent fissures between the webs of the beams and the concrete, and the precaution was taken throughout the structure where waterproofing was used to prevent cracks by the insertion of

longitudinal reinforcement, to assist in maintaining the integrity of the waterproofing envelope. The waterproofing might have been omitted on the roof provided the percentage of longitudinal reinforcement had been increased and assurance felt that the quantity of the concrete work could be kept to a high standard, which it was impracticable to do under the difficult conditions under which it was placed, and further provided that sufficient grade were given the roof for drainage. The grade used on this roof was about 1½ per cent.

Originally it was intended to waterproof all of the sidewalls and in the early stages of the work some waterproofing was applied. This consisted of three coats of a residuum from the refining of petroleum with two intervening layers of burlap or muslin. The waterproofing penetrated and partly saturated the burlap or muslin, so that the resulting envelope was a solid mass. Layers of asphalt and felt were not used for several reasons; one reason was that the source of leaks when they occur is hard to locate, since the leakage flows along the laminations of the envelope, more or less separation of the layers being unavoidable even with the utmost care in placing them. Another reason was the decay of such materials on other work after relatively short periods of exposure, the decay hastened by the gas liquors and other matter with which water under city streets is charged. The permanence of the materials which were used has not been ascertained, though indications point to failure. No trouble from leakage has occurred where they were used, this result perhaps being due in part to the logitudinal reinforcement placed in the walls, about one-half of 3/10 per cent.

Mr. A. M. Kinsman, chief engineer, Baltimore & Ohio R. R., has written a letter containing along with other matter a description of methods used in waterproofing cellar walls constructed in very wet ground. A small hand pump was necessary to keep the water down while the walls were in the course of construction. On the third day the forms were removed and Young's compound applied, the water in the cellar having been lowered to come up around the concrete. It was found that this method was not successful in keeping out the water. A pump was then installed and the water again lowered, an additional thickness of 3 ins. of concrete added to the 10-in. wall on each side making the total thickness 16 ins.; the compound again applied was again a failure, the pumps being unable to keep the water away from the concrete while setting. A well was then dug outside of the cellar walls with a view to reducing the external pressure. The walls were then recoated with 2 ins. of Winslow's compound, the pressure kept away from the walls while hardening and allowed to dry thoroughly; the pump then being stopped, the water ran to its usual level outside the walls and the method proved effective, as the cellar has been dry for the past 18 months.

Cost of Pumping.—The total amount of water pumped at the Harrisburg, Pa., waterworks in 1909 was 3,658,533,150 gals., and the cost of pumping was as follows:

Items.	Per mil. gals.
Coal	$1.38
Supplies	0.36
Repairs	0.31
Oil and waste	0.20
Reservoir	0.43
Labor	1.83
Total per million gallons	$4.51

Cost of Maintaining Water Mains.—The city of Harrisburg, Pa., had in 1909, 67 miles and 1,147 ft. or say 67.22 miles of water mains. The cost for the year to keep these mains in repair, change them to new grades when necessary, change hydrants and look after 9,000 meters was as follows:

Horses and wagons	$ 528.47
Supplies	443.23
Materials and repairs	1,749.44
Salaries	4,907.50
Total	$7,628.64

This is at a rate of $113.48 per mile.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Tables Showing the Amounts and Average Price of Brick, Asphalt and Creosoted Wood Block Pavements Laid in 1909 in a Number of Representative American Cities.

The accompanying tables, pages 337, 338 and 339, show the amount, average price and some details of brick, asphalt and creosoted wood block pavements laid in 1909 in a number of American cities. On our April 5 issue corresponding tables were given containing similar data on stone block pavement, bitulithic and macadam. Tables were also given in the April 6 issue on pages 320 and 323 showing the prevailing local prices for materials and the cost of labor in the cities in which the paving work was done.

Some were laid on brick laid flat. [26]Sand, cement and tar. [27]Guarantee until final acceptance by city. [28]Brick laid on 6-in. stone foundation. [29]1-in. to 2-in. [30]Laid on sand base. [31]5 to 7 year guarantee; 5-in. to 6-in. concrete base. [32]6-in. crushed stone, 2-in. sand, 4-in. brick. [33]Natural cement used for concrete base. [34]$0.50 per cu. yd. for earth, $0.55 per cu. yd. for loose rock and $3.50 per cu. yd. for solid rock. [35]With 6-in. concrete base the price per sq. yd. was $2.08. [36]Natural cement used for concrete base. [37]Cement grout and sand. [38]5 per cent of payment retained for 1 year. [39]6-in. Natural cement 1-2-5 concrete base also used. [40]Some pitch filler was also used; price per sq. yd. given is for sand filler. [41]1 and 2 years. [42]Extra excavation above curb; price for paving includes grading below curb top. [43]By day labor. [44]Block. [45]Laid on gravel 5-in. thick after rolling with 12½-ton roller. [46]Laid on 5-in. bank gravel base. [47]Repaving. [48]Removing old cedar blocks and repaving with brick on old 6-in. concrete base. [49]Laid on 6-in. macadam base. [50]40 cts. per cu. yd. for all grading over 12-in. Price per sq. yd. includes grading to 12-in. [51]Also laid in 5-in. concrete base. [52]Laid on gravel base. [53]1-3-5 for stone aggregate; 1-6 for gravel aggregate. [54]In addition 1,857 sq. yds. of brick was laid on 5-in. concrete base using asphalt filler, at $2.24 per sq. yd.; 1,427 sq. yds. were laid on 5-in. concrete base using sand filler, at $2.06 per sq. yd., and 2,221 sq. yds. were laid on 5-in. concrete base using cement filler, at $2.09½ per sq. yd. [55]Asphalt; also sand. [56]Consists of two courses of brick, the bottom course being grouted. [57]Grout or sand. [58]$1.40 per sq. yd. on 8-in. macadam foundation. [59]Includes 6-in. macadam base. The material from the old macadam streets was used for foundation, but required regrading of entire street as well as crushing of old cobble stones in gutters. [60]Laid on a bridge.

Experimental Work of the New York State Highway Commission in 1909 with Glutrin, and with Resurfacing with Bituminous Macadam and Asphalt Macadam.

During the past year the Bureau of Repairs and Maintenance of the New York State Highway Commission has done a considerable amount of experimental road construction work, in an effort to develop economical forms and methods of construction which would be suited to various weights and classes of traffic. Several highways were selected and experimental forms of resurfacing and uses of materials were carried out under the direction of the county road superintendent in order to obtain accurate data as to the cost and effectiveness of such treatment. This experimental work is described in the recently issued report of the New York State Highway Commission, and the following notes have been taken from the report:

ROAD TREATMENT WITH GLUTRIN.

Road No. 651, Clinton county, which runs from Keesville to Clintonville, gave considerable trouble in the spring and early summer months by raveling. There was also a great deal of complaint about the dust. The road was constructed of a local limestone in the season of 1908. The Robson Process Co.'s plant was situated at Ausable Forks, about six miles west of the end of road No. 651, and inasmuch as they were anxious to demonstrate what their product would do, arrangements were made with the company to treat this road with glutrin. Previous to this treatment the Robson Co. had treated about a mile of road immediately to the west of road No. 651 with their product and it had proved fairly successful in preserving the road from ravel and in laying the dust. The total length of road No. 651 treated with glutrin was 5.58 miles. The number of gallons used was 10,187 and the cost of the treatment to the state was $1,293.75, or $230 per mile. The material was applied by sprinklers much in the same manner as oil is applied. The results have proven satisfactory. Since the application of the glutrin the road surface has hardened and there is very little, if any, indication of the ravel which was so noticeable and troublesome before. The road is not absolutely dustless, but the dust nuisance is very materially reduced. The road has a very fine appearance, showing no discoloration, but retaining the original color of the stone. It is proposed to treat this road with glutrin again this year in order to thoroughly try out the merits of the product and to obtain more accurate data as to the cost of applying.

RESURFACING WITH BITUMINOUS MACADAM BY THE PENETRATION METHOD AND MIXING METHOD.

In the early part of the season of 1909 the State Highway Commission decided to construct two pieces of asphalt macadam for experimental purposes in Oneida county on two of the principal highways leading out of the city of Utica. The roads selected for this experimental work were the Utica-Paris road No. 71, extending southeast from the city of Utica through the town of New Hartford to the town of Paris, and the Deerfield road No. 3, extending easterly from Deerfield Corners, in the town of Deerfield, to the Herkimer county line.

These are two of the most important thoroughfares in Oneida county, being subjected to a great amount of heavy traffic, including automobiles and motor trucks.

The work was performed by the Barber Asphalt Paving Co., using syenite stone from the quarries at Little Falls, N. Y., and Genasco road cement, a Barber Asphalt Paving Co. product.

Utica-Paris Road No. 71—The method used on this road is what is known as the penetration method. A section of the original macadam on this road, 2,177.5 ft. in length and 12 ft. wide, was resurfaced to a depth of 3 ins. The width of the original macadam on this

[1]1-6 gravel. [2]Repaving. [3]3-in. blocks. [4]Expansion joint along curbs. [5]Does not include replacement of foundation. [6]1910 contract. [7]Laid by day labor. [8]Blocks treated with 20 lbs. creosoted oil per cu. ft. timber.

road was 16 ft. The road has been resurfaced at different times since its construction, so that there was from 4 to 5 ins. resurfacing from 8 to 10 ft. wide, on top of the original macadam. This necessitated the removal of from 7 to 8 ins. of macadam at the center to 3 ins. at the edge to bring the new section to avoid a high crown. The new section being only 12 ft. wide, a shoulder was left of old macadam 2 ft. wide on either side of the new section. The percentage of grade, maximum, for a length of 500 ft. was 3.26 per cent; the minimum per centage of grade for 667 ft. was .5 per cent. The percentage of grade for the mean length of 2,177.5 ft. was 1.71 per cent. The maximum crown was 6 ins. and the minimum crown was 4 ins. Construction work was started Aug. 27 and completed Sept. 22.

A 10-ton roller with spikes on the rear rollers was used to loosen the old macadam so that it would be easily shoveled into wagons and removed from the work. After the removal of the top course of old macadam the bottom course was found intact, approaching concrete in its solidity. Upon the old bottom course was spread a 4-in. layer of 1½-in. stone, which was rolled with a 10-ton roller until compressed to 3 ins. This course was then poured with Genasco road cement, using about 2 gals. per square yard of surface; this amount was sufficient to coat all exposed surfaces of the stone. About ½ in. of dry, screened grit was immediately spread over the surface and rolled with a 5-ton tandem roller. After this surface was well rolled all the loose grit was swept to the sides and the squegee course applied. This squegee course consisted of pouring about ½ gal. of Genasco road cement to each square yard of surface and well broomed in, after which the grit which had previously been swept to the sides of the road was swept back on the road surface to a thickness of about ½ in. and thoroughly rolled with both the 5 and 10 ton roller. After this course was completed, the road, which had been entirely closed to traffic during the work, was opened to the public. The tendency of the traffic was to grind the grit into the squegee course, forming a smooth, elastic surface resembling in appearance an asphalt pavement.

The Genasco road cement used in the work was hauled in barrels from the Barber asphalt plant in Utica, a distance of about three miles, melted in kettles placed alongside the road and heated to a temperature of 300 to 350° F. before being placed in the road, using the barrel staves for fuel. The cement was carried in pails from the kettles to the work and fan-sported sprinkling pots were used for the pouring. This does not make a dustless road, but apparently this nuisance will be to a great extent overcome. The noise of the ordinary macadam road or pavement is practically avoided and the elasticity of the surface makes it easy for travel. A summary of the work done and data on its cost are given in Table I, and in Table III a comparison is given with the costs by this mixing method.

TABLE I.

Cost of labor per mile.	$3,843.84
Total cost for labor and material, per mile	$7,861.92

Deerfield Road No. 3.—Work was begun on this road at a point about one mile east of Deerfield Corners. As originally constructed, the macadam on this road was 12 ft. wide. Since its construction it had been resurfaced with macadam to a depth varying from 1 in. to 3 ins. A portion of the macadam was to be removed to avoid a high crown. The length of the section resurfaced was 2,177.5 ft. and the width resurfaced was 12 ft., the depth of the resurfacing being 3 ins. The percentage of grade (maximum) was 1.25 per cent for a length of 325; the percentage of grade (mean) for length of 1,566 ft. was .707 per cent. Construction work was started Sept. 25 and was completed Oct. 13. The maximum amount of crown was 3 ins. and the minimum was 1 in.

The macadam was loosened by hand labor, no scarifier or roller being used for this purpose. Through an arrangement with the town superintendent of Deerfield the old stone was hauled from the work, to be used on town roads, at the expense of the town.

On this road the mixing method was used. The stone used was 1½-in syenite of uniform size from Little Falls. The bituminous material was the same as that used on road No. 71. The stone and grit were shipped by boat to Utica, where the materials were mixed and hauled to the work, a distance of about three miles. The stone and Genasco cement were mixed in the proportion of 1 cu. yd. of stone to 126 lbs. of Genasco cement and the mixing continued until each stone became thoroughly coated with the cement. The Genasco cement was first heated to 300° F., but this temperature was reduced to 100° after a trial had demonstrated that this temperature was too high for practical purposes, as the stone and cement at the higher temperature had a tendency to separate during transportation from the plant to the work. The mixture was dumped upon an iron mixing board in the center of the road and shoveled on the grade and shaped by experienced asphalt rakers. The surface was rolled hot with a 5-ton tandem roller and compressed to a depth of 3 ins. About ½ in. of grit was then placed on the surface and thoroughly rolled, after which the loose grit was swept to the sides of the road and the squegee course applied the same as on road No. 71. As soon as the squegee course was completed the section was opened to traffic. The surface of this road is not as smooth as the Utica-Paris road No. 71, otherwise the appearance of the road is very similar. A summary of the work done and some data on its cost are given in Table II. In Table III a comparison of the costs by the penetration method is given:

TABLE II.

General Figures:

Average rate of progress of construction of metal surfacing per working day, sq. yds.	139.2
Average number of hours per working day	195.66

Labor cost, including allowance for equipment, superintendent and foreman	.53900	.63500
Cost of material	.57080	.45500
Total labor and material	$1.10980	$1.09000
Cost of labor, per mile	$3,843.84	$4,070.04
Total cost labor and material per mile	7,861.92	7,682.40

methods of placing to determine their durability and costs.

In order that the methods might be changed at the will of the commission and new methods that might be brought to its attention tried, the work was performed under the day labor system.

The Loudon road is on the county system of improved public highways and extends from a point in the westerly boundary of the city of Albany near the Northern boulevard, westerly through the village of Loudonville to the village of Newtonville, a distance of 3.41 miles, in the town of Colonie, and has a macadam surface 16 ft. wide. The road passes through a comparatively thickly settled residential portion of Albany county and is probably subject to as heavy traffic as any improved road in this country. This traffic is composed largely of automobiles. During the season of 1907 a portion of this road and the one adjoining, No. 119, was resurfaced by the state engineer with screenings, using Tarvia as a binder.

At the beginning of the season of 1909 the road was in a very bad condition. The macadam surface had raveled and was so rough that the earth shoulder was being used by traffic instead of the macadam surface for a large portion of the road. Work was commenced Aug. 2 in organizing a force and hauling materials to the work.

The road was prepared for the surfacing by first building up an earth shoulder on each side of the road and as this was being done the ditches were cleaned, obstructions in outlets removed, intersecting roads graded to meet new grade, and any unsightly brush, etc., removed. The cost of this work was as follows:

19,950 lin. ft. ..... 4.7 cts. per lin. ft.
3.77 miles ..... 244.82 per mile
33,520 sq. yds. ..... 2.8 cts. per sq. yd.

At first where Tarvia was encountered the old surface was roughened by picks, but later this was discontinued as unnecessary. The old surface was swept by hand with straw and metal brooms so that a satisfactory bond between the old and new surfacing could be secured. Thirty-three thousand five hundred and twenty square yards of surface was thus prepared at a cost of 1 ct. per square yard. This price includes some resweeping which falling leaves made it necessary to perform.

The materials were delivered by steam cars and boats to North Albany, Menands and Schenectady. The delivery points were changed as the work progressed to secure the minimum haul by teams.

At Schenectady the materials were reloaded onto cars of the Schenectady Railroad Co. and hauled by them to Lathams Corners. From Menands and North Albany it was necessary to haul up grades over a mile in length of over 10 per cent.

The cost of hauling and total costs of materials delivered on the work is as follows:

From Dock, North Albany: 1½-in. stone, 2.2 miles average haul $1.23 per cubic yard, 56 cts. per cubic yard mile. From Menands: 1½-in. stone, 2.1 miles average haul $1.01 per cubic yard, 18 cts. per cubic yard mile; ½-in. stone, 2.1 miles average haul 96 cts. per cubic yard, 46 cts. per cubic yard mile; iron tailings, 2.1 miles average haul $1.06 per cubic yard, 50 cts. per cubic yard mile. From North Albany: ½-in. stone, average haul 2.05 miles $1.18 per cubic yard, 57 cts. per cubic yard mile; iron tailings, average haul 2.05 miles $1.28 per cubic yard, 62 cts. per cubic yard mile. From Lathams Corners: 1½-in. stone, average haul 1.7 miles 53 cts. per cubic yard, 31 cts. per cubic yard mile; ½-in. stone, average haul 1.7 miles 48 cts. per cubic yard, 28 cts. per cubic yard mile; iron tailings, average haul 1.3 miles 43 cts. per cubic yard, 33 cts. per cubic yard mile. From North Albany: Oil, average haul 2.7 miles 78/100 cts. per gallon, 3/10 cts. per gallon mile; coal, average haul 4 miles $1.55 per ton, 38 cts. per ton mile.

The cost of stone delivered on the work was as follows:

	Per cu. yd.
Cost f. o. b. Albany, Menands, Lathams Corners	$1.51
Cost unloading	.38
Cost hauling	1.07
Total per cubic yard on work	$2.96

The stone used for new surface was of the 1½-in. size and included trap rock from the quarries of the Rockland Lake Trap Rock Co., Rockland Lake, N. Y., and limestone from the quarries of the Callanan Road Improvement Co. at Bethlehem, N. Y.

There was used on the work as new course 1,898 cu. yds. of trap rock placed between stations 0+00 and 155+50. There was also used 60 cu. yds. of 1½-in. and ¾-in. maintenance stone and 1,313 cu. yds. of limestone, which were placed between stations 155+50 and 188+55, making a total of 3,271 cu. yds. spread over 33,520 sq. yds. of surface. This course averages 3½ ins. in depth, loose measure, and was spread at a cost of 9.4 cts. per cubic yard, or .9 ct. per square yard of surface, loose measure, or 1.2 cts. per square yard rolled. The total cost of the 1½ ins. of stone laid was $3.05 per cubic yard, loose measure, or $4.06 rolled in place. To determine the cubic yardage of materials, loose measure, ten wagon loads of each size were weighed. One and one-half inch stone was found to weigh 2,550 lbs. per cubic yard, ½-in. stone 2,330 lbs. per cubic yard and iron tailings 2,980 lbs. per cubic yard.

The oil used on the work with the exception of the Genasco road cement was received at North Albany in tank cars; the Genasco road cement was contained in barrels. It was necessary to raise the temperature of the oil in tank cars to approximately 170° F. before it could be pumped readily. These cars were fitted with steam coils and steam was lead to them from a steam boiler provided for this purpose. The oil was pumped from the cars into wooden rectangular tanks which were fitted with steam coils and hauled in them to the work, where steam was lead to the coils from a steam roller and oil raised to pumping temperature. The pumps used were similar to those used on canal boats and found satisfactory. Some trouble was experienced with leather packing for the valves and it was found necessary to repack the pumps every day on an average.

Four different oils were used—Gulf Refining Co.'s repair binder, Standard repair binder, Standard asphalt macadam binder, under specifications No. 1, New York state, and Genasco road cement.

The Gulf Refining Co.'s oil was used between stations 87+10 and 102+87. The method used is known as the penetration method, and was employed as follows:

The course of 1½-in. stone was first laid, rolled and ½-in. screenings spread at the rate of 2 cu. yds. to the 100 ft., approximately, and rolled in. Oil was now applied at the rate of 1.9 gals. per square yard and the surface rescreened with ½-in. screenings and rolled. The surface was then swept free from screenings and oil was applied for a squegee course at the rate of .7 gal. per square yard, screened with iron tailings and rolled. This was left for a day and as fast as the oil appeared at the top the surface was rescreened with iron tailings. In all about 7 cu. yds. to 100 ft. were used. The cost of applying was as follows, this cost including only labor, rent of oiler and cost of oil:

	Per gal.
Cost 7,631 gals.	$0.0624
Heating to pump	0.0064
Pumping	0.0071
Hauling	0.0078
Applying (man, oiler and team)	0.0143
Spreading screenings	0.0253
Total	$0.1232

Standard repair binder was used between stations 30—00 and 87—10. Standard macadam asphalt binder under specification No. 1, New York state, was used between stations 0—00 and 30+00, also 102+89 and 173+36. The method employed is known as the puddled method and was employed as follows:

The course of 1½-in. stone was first laid, rolled and filled by water puddling with ½-in. screenings and some iron tailings at the rate of approximately 4 cu. yds. to 100 ft. The surface was then broken up with blunt pointed forks and rolled lightly. Oil was now applied at the rate of approximately 1 gal. to the square yard, the road screened with ½-in. stone and rerolled. The surface was then swept free from screenings and oiled, and a squegee course was applied at the rate of approximately ½ gal. to the square yard, screened with iron tailings and rerolled. The work was now left for a day and as fast as oil appeared on the surface the course was rescreened. In all about 7 cu. yds. to 100 ft. were used.

Genasco road cement was used between stations 173+36 and 188+55, the end of the work. The method employed in puddling was the same as that used in spreading the Standard products except that the Genasco road cement was applied in one coat at a rate of approximately 1.5 gals. to the square yard instead of in two coats.

The average cost of applying oil by the puddling method appears below, also the cost of applying Genasco road cement:

Average Costs by Puddling Methods.

	Per gal.
Cost of oil, 50,054 gals.	$0.0550
Heating to pump	0.0059
Pumping	0.0066
Hauling	0.0078
Applying (man, oiler, team)	0.0143
Spreading screenings	0.0252
Puddling	0.0058
Breaking up	0.0032
Total	$0.1238

Cost of Genasco Road Cement Spread.

	Per gal.
Cost of 4,307 gals.	$0.1156
Pumping	0.0041
Hauling	0.0078
Applying (man, oiler, team)	0.0143
Spreading screenings	0.0252
Total	$0.1669

In spreading oil, an oiler manufactured by Gaylor, Fox & Whalen was employed. This oiler consists of a heater of about 300 gal. capacity in which the oil is contained. Under the boiler a fire box is provided using wood as fuel. A small steam boiler is used to generate steam which is led to the spreading device, heating it to a temperature to allow free pass-

age of the oil. The amount of oil applied is regulated by the speed of the moving apparatus.

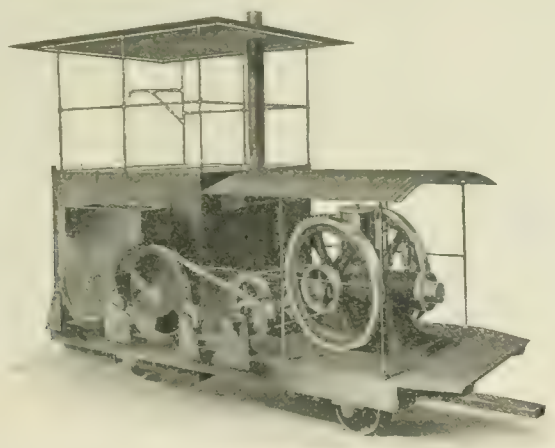
The work of repairing this road was completed Nov. 19, 1909. A summary of the cost based on the number of square yards surfaced and separated into the various items is as follows:

	Per sq. yd.
Superintendent, rent of plant, time keeping, watchman and general	17.4
Building shoulder	2.8
Preparing surface	1.
Cost of stone and screenings, f. o. b. Albany, Menands and Schenectady	25.6
Unloading stone	6.5
Hauling stone and screenings	18.1
Spreading stone	.9
Rolling	1.7
Cost of oil, f. o. b. Albany	10.0
Heating oil	1.3
Pumping oil	1.0
Hauling oil	1.4
Applying oil	4.0
Spreading screenings	4.5
Puddling	1.5
Total	97.7

Culvert, 199-50, $117.

A New Type of Mixing Plant for Bituminous Paving Mixtures, and Data on the Cost of Constructing Asphaltic Concrete with It.

Uniformity in the proportioning of ingredients and in the temperatures at which they are heated and mixed is one of the principal factors in the manufacture of bituminous paving mixtures. It is further desirable that the hot mineral aggregate and the hot bitumen should be quickly and uniformly mixed with as little loss in heat as possible, and that the resulting homogeneous mixture should then be quickly and evenly spread and thoroughly rolled. There has recently been placed on the market a mixing plant designed especially to meet the above conditions. This plant is complete in itself, measuring and heating the mineral aggregates and uniformly mixing them with the proper amount of bituminous cement, which cement is also heated and measured by the plant. In this plant the heating and mixing drums are placed in a casing and in the same casing, immediately above, are situated the two melting kettles. The entire interior of the casing is heated by fuel oil, giving a constant, uniform temperature entirely around both drums, the bottom and four sides of the melting kettles. As the entire casing or housing is lined with heavy asbestos, the full benefit of the heat generated by the fuel oil is obtained. The machine is duplex, and while the material is being heated and mixed in one drum, other materials are being placed in the other drum without the loss of time by laborers, thus allowing the drums to discharge the hot mixtures alternately.



Goodwin Duplex Mixing Plant for Bituminous Pavements.

In front of the housing and on same frame are the boiler and steam engine, or a fuel oil engine, whichever is desired. The latter has the advantage that $4 to $6 per day is saved in fuel and that no fuel expense is incurred except during operation. Licensed engineers or firemen are not required with the fuel oil engine. This plant is also equipped with a fuel oil tank having sufficient capacity for a day's supply for the engine, also a day's supply for heating the mixing drums and melting kettles.

An air compressor is supplied, also a tank for same, sufficiently large to operate the oil burner and agitate the material in the melting tanks. This compressor is directly connected and thoroughly protected from the weather. A water tank is provided for supplying water to either the oil engine or steam boiler.

In transporting the plant by rail the upper railing and the small stack are detached. The plant is then hauled on its own wheels to a flat car and by the use of skids from the end of the car and a block and tackle the plant is placed on the car ready for shipment.

In operating the plant it is placed on or adjacent to the roadway under construction and within wheeling distance for the barrows. Sufficient materials and supplies for two days' paving are placed convenient to the plant.

The proper proportion of the two or more different size stone and sand is measured in batches, in one of the several simple ways, and then shoveled into either one of the hoppers leading to the heating drums. When the moisture has been driven off the sand and stone and they are sufficiently hot, the proper amount of hot bitumen is introduced into the same mixing drum by gravity from the measure placed on the opposite side from the stone and sand hoppers. When the materials are thoroughly mixed and the proper temperature obtained, the door at the end of the drum is opened and the contents of the drum automatically discharged into wheelbarrows placed on the side of the plant when they are immediately wheeled to the place of operation.

The man situated on the top of the housing attends to the placing of the stone and sand alternately into the drums, and also runs the proper amount of hot bitumen from either tank in the measure. The melting tanks are filled by the use of the lift on top of the housing, which brings the bituminous material from the ground and places it in the tanks, where it is melted and then run by gravity into the measure. The drums, revolving independent of each other, are under the supervision of the plant engineer, who stops either one of them when the doors are opened or closed.

The capacity of any plant for heating and mixing materials of this class depends principally on the amount of moisture in the mineral aggregates, the melting point of the bitumen, the climatic conditions, and the efficiency of the plant used. Under ordinary conditions it is claimed that this plant will heat and mix 70 tons of a mixture composed of stone, sand and bitumen in ten hours and as paving of this class will average 200 lbs. per square yard when compressed to 2 ins., this gives the plant a capacity of 700 sq. yds. per day for ten hours. However, 600 sq. yds. is all that is claimed for it. In a paving mixture known as sheet asphalt, which is composed of sand, inorganic dust and asphalt, the capacity of the plant would be about 10 per cent less than for a stone mixture, as the sand contains a large percentage of moisture, a higher melting point asphalt is used and more mixing and heating are required.

The following estimate on the cost of bituminous pavement work with this plant is based on average prices and will of course vary with local conditions:

Plant Equipment.

Heating and mixing plant	$3,000.00
Ten-ton roller, three wheels	2,500.00
Fire wagon	217.50
4 steel barrows, 5 cubic feet	58.00
2 asphalt tampers, 4x10	5.00
6 rakes, 18-in. steel shank	9.00
6 shovels, all steel	6.00
6 shovels	4.50
Total	$5,800.00

Working Force.

	Total per day.
1 foreman	$4.00
1 plant engineer	3.00
1 roller engineer	3.00
2 rakers at $2.25	4.50
1 tamper	2.00
1 kettleman	2.00
1 mixer man	2.00
4 wheelbarrow men at $1.75	7.00
2 shoveling stone and sand at $1.75	3.50
1 general laborer	1.75
15	$32.75

Cost of Materials and Supplies Delivered on the Operation.

Asphalt, per net ton (tare allowed)	$20.00
Stone, per net ton	1.65
Stone screenings, per net ton	1.50
Sand, per net ton	1.25
Fuel oil, per gallon	.05
Coal, per ton	3.50
Lubricating oil, per gallon	.30

Using the above figures as a basis, the following is an estimate of the costs on the construction of one mile of 2-in. asphaltic concrete, 16-ft. roadway:

	Cost per working day.	Cost per sq. yd.
Fixed charges, depreciation of equipment	$ 1.58	$0.00263
Fixed charges, interest on equipment	1.26	.00210
Fixed charges, transportation on equipment	6.00	.01
Labor	32.75	.05458
Material, asphalt	84.00	.14
Material, ¾-in. stone	34.65	.05775
Material, stone screenings	31.50	.0525
Material, sand	17.25	.02875
Supplies, fuel oil	2.50	.00416
Supplies, coal	4.38	.0073
Supplies, lubricating oil	.15	.00025
Miscellaneous expenses, repairs, etc.	1.48	.00246
Totals	$217 50	$0.3625

The cost per square yard is figured on the basis of an output of 600 sq. yds. per day. Depreciation is figured at 7½ per cent per annum for 275 working days and interest on equipment at 6 per cent for the same period.

The plant described above is known as the Godwin duplex plant. It is handled by W. S. Godwin, Box 95, Times Square station, New York city, to whom we are indebted for the descriptive matter and the cost figures.

Cost of Removing and Testing Meters.—A system of removing and testing meters is now being developed at Harrisburg, Pa., from the knowledge gained in testing the oldest meters in the department. It has been decided to remove, clean and test all meters commencing with the one longest in service and by reason of the information secured map out a plan for use that will enable the future tests to be made at the proper time. In doing this work in 1909 1,970 meters were taken out, 1,712 were cleaned, tested and new parts put in those needing them. Of these 76 had to be sent to the factory and the balance were repaired at the meter shop. Of the meters taken out, 916 needed very little or no material to make them register correctly and no charges were made for their removal, cleaning, testing and resetting. The charges made against the 796 that did need considerable attention were $1,473, an average of $1.85 per meter charged for, of 86 cts. per meter removed and of 16 cts. per meter in use.

Water-works and Sewer Section

Note: This section is devoted to methods and costs of constructing sewers and water-works. It will cover the construction work for all details of water supply and sewerage, including sewage purification and water filtration.

A Novel Method of Placing Cast Iron Wells in a Water Works Crib.

The work under contract with George W. Jackson, Inc., for the construction of the new Southwest Lake and Land Tunnel for the city of Chicago is rapidly nearing completion and particular interest attaches to the methods adopted for placing the heavy cast iron wells in the permanent crib in Lake Michigan, about 2 1/6 miles from the shore.

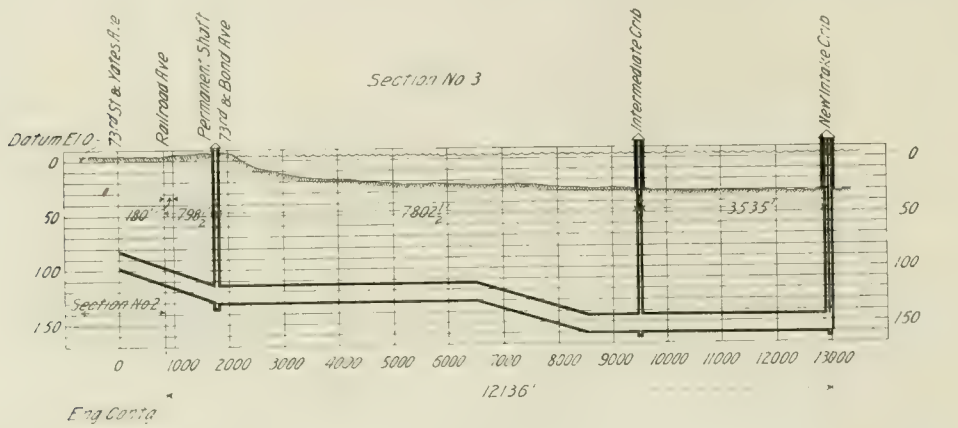


Fig. 1—Profile of Lake Section of Southwest Land and Lake Tunnel, Chicago Water Works.

Figure 1 shows the tunnel in profile. The intermediate crib, 7,802 ft. from land, has been used as a working shaft and will be sealed when work is completed. It was on this crib that a fire occurred about one year ago in which a number of workmen lost their lives. Figure 2 shows the alignment of the tunnel as proposed by the engineers for the city, the angle being at the land shaft.

This idea was abandoned and the angle made at the temporary construction crib as shown. Figure 3 shows the tunnel as constructed. The concrete in the lining is a 1:3:6 mix. The depth of the tunnel below the surface is shown on the profile, this depth being selected so the tunnel would be in solid rock all the way, thus doing away with troubles experienced in driving older tunnels and making it possible to prosecute the work without using air. On shore the tunnel is only 90 ft. below datum, datum being practically at ordinary surface water level in Lake Michigan. The tunnel lining was to be as nearly as possible a minimum of 12 ins. in thickness and the specifications provided for excavation to a neat line 17 ins. outside the inner face of the tunnel, with no projections exceeding 5 ins. Profiles were taken at 5-ft. intervals and the sum of the base areas of the projections in any 5-ft. length of tunnel could not exceed 15 per cent of the total area formed by multiplying the length of the outer neat line by 5 ft., all base areas being measured on this line.

The share shaft was driven through a surface stratum of gravel, boulders and sand pockets overlying a bed of hard clay resting on the rock. Steel sheet piles of the Jackson interlocking type, 50 ft. long, were driven through the bad material into the clay in a circle 21 ft. inside diameter, before beginning excavation. The work proceeded with no more difficulty or drawbacks than are usually incidental to work of this nature. The intermediate crib surrounding the temporary working shaft is hexagonal in form and made of heavy timbers. Inside this crib was driven a shaft of steel sheet piling in 50-ft. lengths in a circle having a diameter of 16 ft., with another shaft of piling 20 ft. long driven into the clay, 11 ft. 5 ins. diameter, the space between the steel shells being packed with clay. The depth of water was 33 ft. After the disastrous fire of Jan. 20, 1909, the coroner's jury exonerating the contractors from all blame, the superstructure of the crib was rebuilt in conformity with specifications prepared under the supervision of the city officials. Figure 4 is an interior view of the intermediate crib while under construction, the frame on the left being a part of the tramway system, the large cable wheel showing.

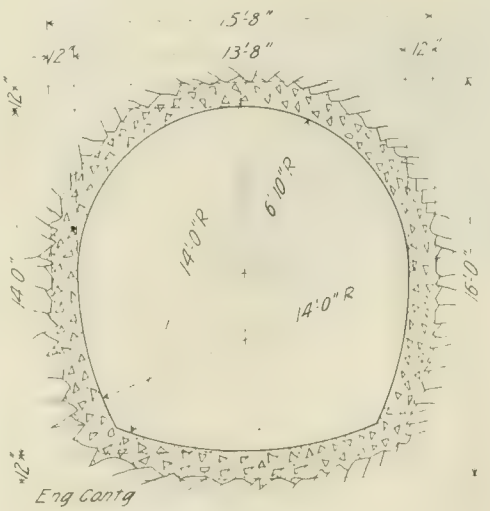

Fig. 3—Transverse Section of Southwest Land and Lake Tunnel.

The tramway was similar to aerial tramways used in mountainous districts, Fig. 5 showing it in the lake. The towers were 65 ft. in height and 1,100 ft. apart, the foundations being 28 ft. in diameter at the base of the tower. The towers were built by driving the legs into the clay lake bed, the continuation of the legs below water level being steel channels. Around each tower was placed a wooden ring, conical in shape, the vertical plank or staves being banded with iron, the length of the wooden protection being such that the bottom was below probable wave action. Broken stone was placed inside and allowed to run out below in mound form. The construction described was that adopted after lighter towers without good protection had been damaged by an ice flow. The large towers finally adopted went through the two years of service without damage by waves or ice.

The aerial cableway is claimed by every one connected with the work to have been an absolute success, for the work has been pushed continuously in all weathers. If this means of transport had not been adopted and boats relied upon for the transport of laborers and materials there would have been frequent interruptions on account of bad weather and ice floes. By the terms of the contract work had to be prosecuted in four headings, hence the temporary crib 7,500 ft. off shore.

The permanent crib is shown under construction in Fig. 6 and the steel stiffening trusses inside are shown in Fig. 7. Details of the crib are shown in Fig. 8, a reproduction from the construction drawings. The bottom diameter is 111 ft. 2⅝ ins. and the top diameter 109 ft. 1¾ ins., the total height being 46 ft. 4 ins. The floor is of timber grillage 4 ft. 4 ins. thick and for a height of 24 ft. 4 ins. the side walls are of timber grillage 26 ft. thick with 8 intake ports each 7 ft. square. The timber portion of the crib is sheathed on both sides with 3¾-in. yellow pine planking. Two concentric steel shells placed on top of the wooden portion formed an interior well 60 ft. in diameter with two pairs of stiffening trusses crossing the well to take care of launching and sinking strains. Between the shells are 24 radial diaphrams of steel, giving additional stiffness and forming compartments. Riprap stone, all under 12 ins. in size, was placed in the compartments as ballast when the crib was launched and floated to position, the parts in the lower portion being closed. When the crib was sunk the riprap stone was taken out and deposited around the base, all the pockets being then filled with concrete. The upper part of the crib was built of masonry, the faces being dressed granite with concrete backing or core, to an elevation of 13 ft. 4 ins. above datum.

In the well are two 14-ft. intake shafts of cast iron with six gates and hoisting gear, the construction being shown in plan and elevation in Fig. 9. The method adopted for getting the heavy cast iron cylinders into position is credited to Mr. Daniel O'Connor, the general superintendent for the contractor, and is essentially the feature of the work most interesting to contractors because of the ingenuity displayed in the conception and carrying out of the work. The Jackson sheet steel forms for concrete shafts were used as shields to carry the shafts down through the lake bottom and clay substratum to rock, where the connection was made with the upraise from the tunnel. The first work done was to blast holes through the timber bottom 4 ft. 6 ins. thick, to let the shields through. Holes 2 ins. in diameter were drilled as close together as possible in a circle for each shaft, and the form of bit found most successful after several trials is shown in Fig. 10, steam drills being used carried on the cross bracing trusses. After the circles were completed holes were drilled in the center and loaded with dynamite, this method of blasting proving good, the outer circle of holes weakening the timber so it broke out nicely.

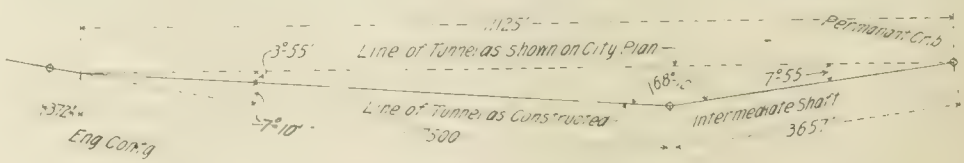

Fig. 2—Alinement of Lake Section of Southwest Land and Lake Tunnel.

Fig. 4—View of Intermediate Crib in Course of Construction.

The Jackson sheet steel forms were then lowered into place, sections being bolted to the top as the shield was lowered through the hole in the timber bottom. When bottom was reached the lower end of the bottom section became a cutting edge, the flange having been removed for this purpose. Bags of sand were used to weight the shields when the lake bottom was reached. When clay was reached and the shields made perpendicular, guide rails were placed inside to guide the heavy cylinders of the intake shafts. The shields were then filled with sand to a height of 1 ft. above water level, the sand being taken out on the tug in bags. It was later used for concrete work in the crib. It was a comparatively easy matter to lower the light shields, but trouble was experienced in doing this part of the work, and proved the wisdom of the method adopted for putting in the heavy cylinders, which consisted in placing the lower section inside the shield and sinking it by "mucking" out the sand, the weight of the cylinder increasing as each section was added and forcing the lower edge into the sand. The inside diameter of the shields was 15 ft. 8 ins. and the outside diameter of the intake shafts is 14 ft., which gave very little clearance, for the steel plates were 7/16 in. thick, with 3½x3½x⅜-in. angles for frames. The tops of the intake shafts are 8 ft. 6 ins. above datum and the heavy cast iron sections 8 ft. wide were sunk to a depth of 46 ft. 5 ins. below datum, when the section containing the lowest gate section, 9 ft. 6 ins. wide, was put on, followed by the upper gate section of the same size, the two top sections being 6-ft. rings. Concrete was placed between the shield and the cast iron cylinder up to the bottom of the lower gate section. Below this point the shield was left in place and the portions of the shield above were raised by jacking up, the jacks supported by the cylinder. Below the lower gate section the shaft down to the tunnel was reduced to a diameter of 12 ft. 3 ins. by a concrete lining, the total thickness of this lining being 20½ ins. Below the bottom of the cast iron cylinders excavation was carried on in the usual method in the clay, the Jackson sheet steel forms being put in place section by section to form a lining to the shaft until it was completed and ready for the concrete lining, the steel lining being left in place. This method was used down to the rock, where connection was made with the uprise from the tunnel.

The work was done under the supervision of Mr. George F. Samuels, present acting city engineer, and the following data on number of men and time consumed on the work are from the daily reports of the city inspectors, the reports being public records. A day's work was 9½ hours, from 7 a. m. to 5:30 p. m., and a double shift was 24 hours, from 7 a. m. to 7 a. m. of the day following. A tug and a launch were used daily. An assistant foreman was on the job all the time and occasionaly a foreman was there also. In putting down the time the item of foreman has been lumped. No wages are given in the reports, but union wages were paid.

Timber trusses were first put across the well to carry a working platform on which to place the drilling machinery and carry material. After everything was cleared the following force placed the trusses and platform and rigged up the drilling machinery for the west shaft:

	Days time charged.
Superintendent	2
Foreman	8
Laborers (3 to 7 each day)	40
Fireman	10
Engineer	6
Blacksmith	3
Diver	3
Machinist	1
Tug and crew	3
Launch and crew	3

Fig. 5—Aerial Tramway Construction with Steel Towers 1100 ft. Apart and 65 ft. in Height, Setting on Rock Foundations, 28 ft. in Diameter at the Top and Increasing in Size Towards the Bottom.

After drilling 66 holes, each about 40 ins. deep, in the bottom for the west shaft a second drill was set up and a centrifugal pump put in to pump out the shaft. From 8 to 14 holes were drilled per day with one

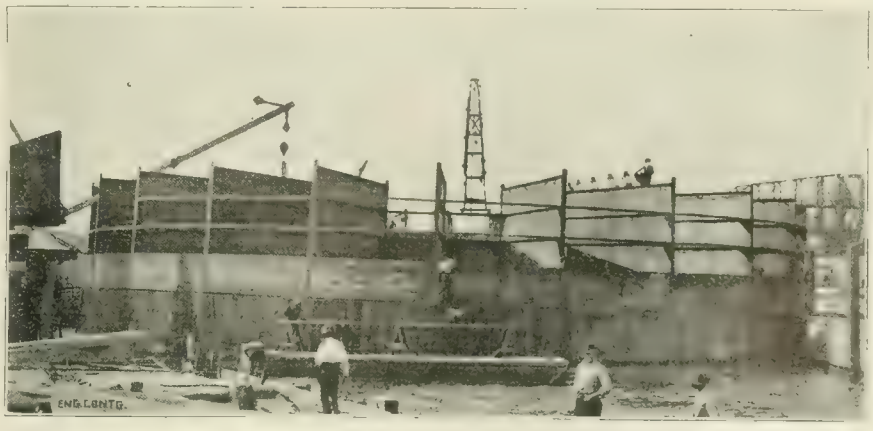

Fig. 6—Intake Crib in Course of Construction.

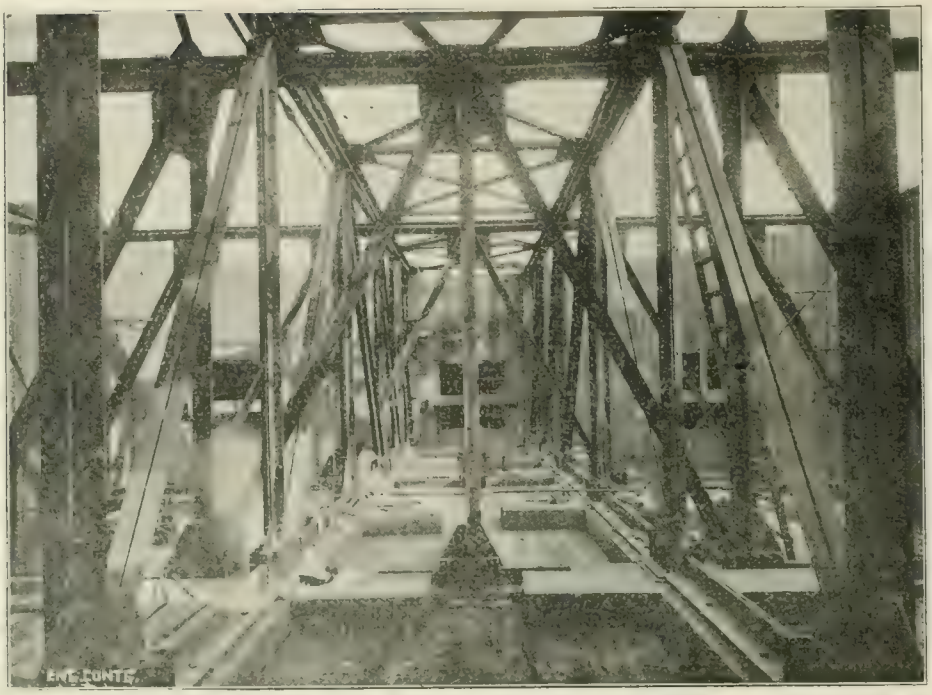

Fig. 7—Interior View of Intake Crib Showing Stiffening Trusses.

machine and when the two drills were working each one drilled from 8 to 9 holes daily; 154 holes were drilled partly through and 111 holes drilled through. In the following table drillers, helpers and laborers are lumped under one heading of laborers:

	Days time charged.
Superintendent	5
Foreman	30
Laborers (2 to 7 daily)	100
Engineer	28
Fireman	30
Blacksmith	8
Diver	8
Machinist	12

Two ⅞-in. wire ropes were stretched across the crib from which to suspend the shields and castings, and the drills and pump were set temporarily over the east shaft while the shooting was done in the west shaft. Work was stopped several days on account of stormy weather, this work being done in March and April. The time as recorded is not well segregated as between shooting in the west shaft and drilling in the east shaft, but as nearly as a segregation may be made from the records, time chargeable to the shooting is about as follows:

	Days.
Foreman	5
Laborers	37½
Engineer	5½
Fireman	6
Diver	13
Machinist	12

Drilling for the east shaft commenced before the shooting in the west shaft was finished, two drills being used. The following time covers the drilling in east shaft, shooting timbers in east shaft and lowering shield in west shaft, the operations not being segregated in the daily reports. A derrick and a pile driver were also set up. In lowering the shield some tight barrels were attached to relieve the weight until bottom was reached, 30 being used on the west shield. When the shield reached clay it was jetted down and ballast piled on top to help force it down, a diver and helper working at the bottom. A pump was placed in the west shield after it had entered the clay 2½ ft., but after the water had been lowered 1 ft. it suddenly filled again. An orange peel bucket was tried in the shaft, but not proving a success was taken out. A platform was placed across the shield and weighted with gravel. A diver located a leak in the second section of the shield, a number of bolts having sheared, evidently because of the shooting. This was stopped, but another leak opened when the cutting edge passed through a sand pocket. The orange peel bucket was again put into service and a diver was almost constantly at work mucking around the cutting edge inside, with some trips on the outside to locate and stop leaks. When the shield was down 8 ft. into the clay the pumps were taken out and everything cleared. The bolts connecting the second and third rings from the bottom were removed and drift bolts substituted so the upper sections could be lifted readily when required. Several times the pumps had been started and once succeeded in lowering the water as much as 8 ft. The shield did not go down plumb, but had to be pulled over with hoist and tackle and shifting of weights, extra shield sections being used with the gravel, and at one time 18 bbls. filled with water were added. The last time the pumps were used the water was lowered to within 10 ft. of the bottom, when another leak occurred and the shaft filled at the rate of 1 ft. per minute with both pumps (No. 3 Nye diaphragm pumps) working. About 700 bags of sand were brought from shore and cylinder sections for the west shaft. One was dropped and broke. Guide rails, 8 in number, were placed in the west shield to guide the cylinder sections, for the clearance was small. The following is the force account reported for the foregoing work:

	Days.
Foreman	60
Laborers, helpers, etc.	400
Miners	6
Engineer	58
Fireman	60
Diver	42
Machinist	10
Pile driver (crew 6 men)	4
Launch (crew 1 man)	2

No doubt some of the labor would be saved on a similar job. The pumping was a

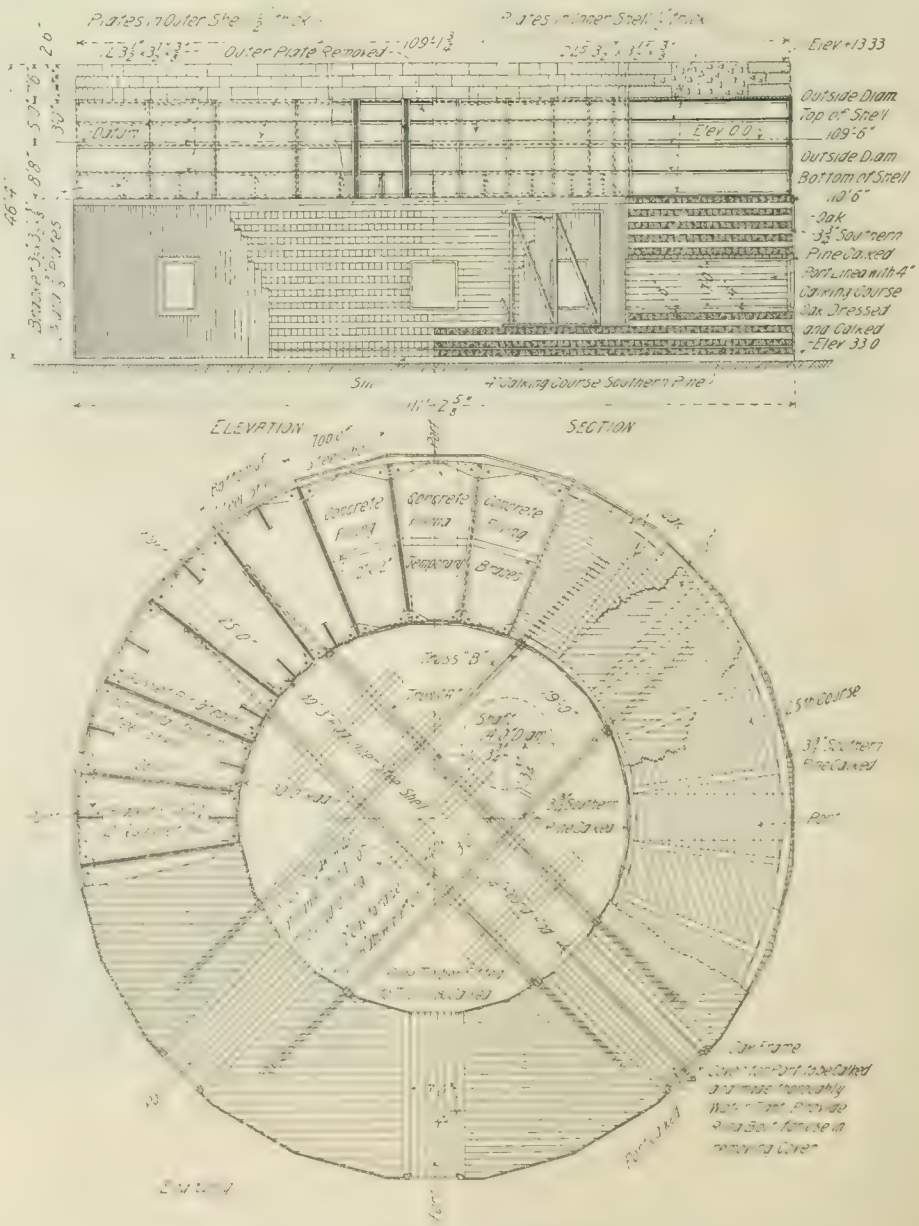

Fig. 8—Details of Intake Crib.

costly item and did not seem to be very successful. The shield was not heavy enough of itself to penetrate readily even with the orange peel bucket excavating and the diver mucking. The lightening effect of submergence was apparently not taken fully into consideration, and trouble resulted in maintaining verticality. The gravel and extra shield sections placed on top had to be shifted and a projecting platform put on to carry 18 barrels filled with water. These weights had to help carry the shield down and also overcome the buoying due to submergence. This no doubt had a little to do with the leaks. Had weights been attached in some way lower inside the shield, less trouble might have been experienced. No doubt the contractor has a full account of all losses of time for each man, but the public records merely record each day's work and give the number of men employed and their rating.

When the work of putting in sand commenced the water was 31 ft. deep in the shield. Ten working days were required to put the sand in bags, carry it to the crib and fill the shield until the sand stood 1 ft. above water level. Some cylinder sections were also handled. Two foremen were employed and the force account was as follows:

	Days.
Foremen	15
Laborers	116
Engineer	10
Fireman	10
Diver	3
Blacksmith	2
Carpenter	1

After filling the shield with sand it took 11 working days to sink the bottom of the cylinder to a depth of 29 ft. below the water surface. The upper sections of the shield were then removed by jacking and placed on a scow. When about ready to place the first gate section the stiff legs gave way and it dropped into the lake. For this work the force account stood as follows:

	Days.
Civil engineer	6
Rodman	5
Foreman	13
Laborers	84
Engineer	12
Fireman	12
Diver	3
Machinist	5
Carpenter	8

The old shield was placed on a scow, a new derrick was built, the old derrick repaired and the lost gate section recovered in good order. A diver with laborers was employed inside the cylinders and a Nye pump kept at work. While going through the sand the cylinder dropped 3.7 ft. one day and 5.1 ft. the next day. At a depth of 38.4 ft. below the water surface hard clay was struck, after which it was found necessary to pile sand bags on top of the cylinder to weight it. A leak started and the diver found 4 ft. of torpedo sand in the bottom, which had come in from between the shield and cylinder. The space was refilled with sand and as the cylinder went down bags of sand were piled on top until at the last the total number of bags was 6,236. As the cylinder went into the clay the diver was apparently principally employed in packing clay around the cylinder and stopping leaks, while the No. 5 Nye pump kept the water down during the mining. The force account was as follows:

	Days.
Foreman	69
Laborers	300
Engineer	56
Fireman	46
Divers	35
Civil engineer	14
Rodman	14
Carpenters	21
Machinists	12
Electricians	7

The number of working days was about 50, but some of the days charged to foremen were due to night shifts and also to the fact that a number of foremen on work temporarily stopped were used here as superior workmen.

To blast and remove floor timber in the east well preparatory to sinking the shield took 10 working days with the following force:

	Days.
Foremen	10
Laborers	47
Engineer	11
Firemen	13
Diver	10
Carpenters	6

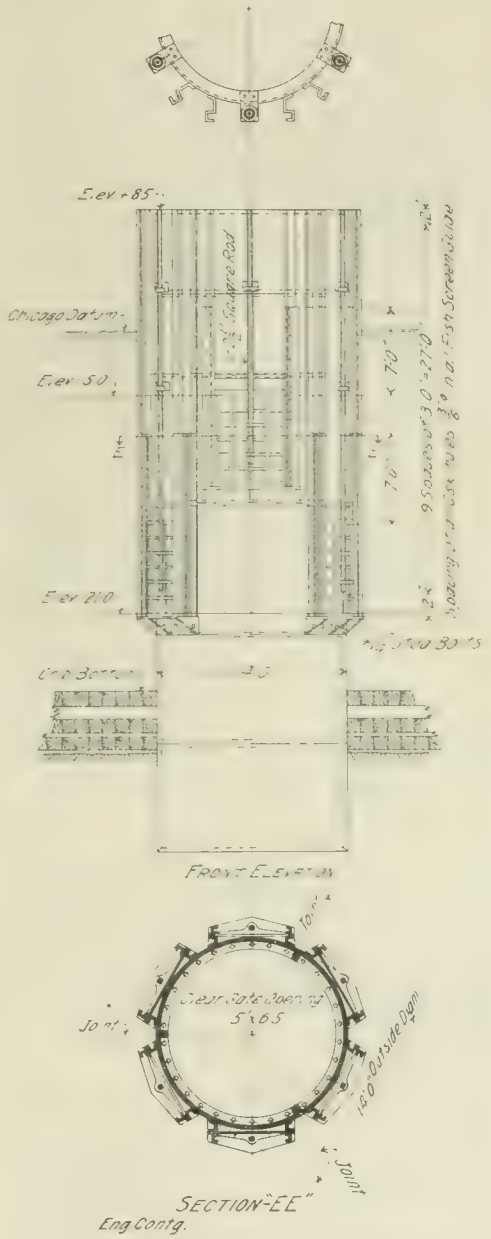

Fig. 9—Details of Intake Shafts.

It took 12 working days to get the cutting edge of the shield for the east shaft down into the clay 5 ft. and 34.2 ft. below the water surface. The shaft was dry and there had been no trouble with leaks. To weight the shield there had been used 1,950 bags of sand, reported as weighing a total of 102.37 tons.

Fig 10.—Auger Bit for Boring Holes in Wood Bottom of Crib.

The filling of the shield with sand was commenced and at the same time the bags were removed. When 5 ft. of sand had been put in and only 400 bags remained on top, the shield suddenly collapsed. To get to this point the force account showed:

	Days.
Foremen	11
Laborers	66
Engineer	12
Firemen	17
Diver	12

To remove the wrecked shield, clean up and get ready for lowering a new shield required the following men:

	Days.
Foreman	6
Laborers	44
Engineer	7
Fireman	9
Diver	7
Carpenters	11

It required 28 sticks of dynamite in 5 shots to loosen the shield after a number of bolts had been cut.

In 19 working days after cleaning out the shield the new shield was placed, sunk to depth, and filled with sand to the level of the lake surface. A total of 1,380 bags of sand was used to weight it. The shield was 14 ins. out of plumb at the top, but was pulled over and guide rails for the cylinder placed before the sand was put in. The lower edge of the cast iron cylinder was trimmed to form a cutting edge. Up to this point the force account was as follows:

	Days.
Foreman	10
Laborers	119
Engineer	20
Fireman	19
Diver	18

No particular trouble was experienced in placing and sinking the cylinder for the east shaft. The notes state that on Nov. 24 "had excavated 28 cu. yds. sand when 4 rings of cylinder in place sunk exactly in place down 29.4 ft." The work here described commenced on March 12, 1909, and on Nov. 16, 1909, the first ring of the cylinder for the east shaft was connected and sinking commenced. On Dec. 17 the cutting edge was down 35 ft. and the shield had been removed. Work was closed down for the winter, but has been again resumed and the task will be shortly completed.

To get the cylinder down 35 ft. and well into the clay so no trouble would be feared in resuming work the following force account was reported:

	Days.
Foremen	18
Laborers	110
Engineer	25
Firemen	28
Divers	18
Riggers	24

Up to the time work was stopped for the winter the cylinder had not been weighted, but the gate sections had been placed.

Charges for Water for Building Purposes.—The following schedule of charges for water for building purposes has been adopted by the water works department of South Bend, Ind.:

Per 1,000 brick laid	$0.06
Per cord stone laid	0.15
Per 1,000 cement blocks laid	0.50
Per 100 sq. yds. plastering	0.20
Per 100 sq. ft. cement walk	0.20
Per 100 lin. ft. cement curb	0.20
Per 100 sq. ft. cement floor (3 ins. or less)	0.10
Per 100 sq. ft. cement floor (over 3 ins.)	0.20
Sprinkling or dipping brick per 1,000	0.05
Per 100 cu. ft. of concrete	0.30
Meter rates for building purposes per 1,000 gals.	1.00

Reconstructed Tunnel Lining.—The report of the Committee on Roadway of the American Railway Engineering and Maintenance of Way Association contains the following recommended practice in lining railway tunnels: "We recommend the use of concrete for the permanent lining of tunnels requiring support. We recognize, however, that in certain conditions, e. g., when the movement of the material through which the tunnel is excavated is so rapid that concrete will not have time to reach a permanent set, a brick lining must be constructed. When brick are used for tunnel lining, that portion of the arch for a horizontal distance of five feet each side of the center line of track should be of vitrified brick laid in Portland cement mortar."

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

Construction of a 135-Mile Wood, Stone and Cast Iron Pressure Pipe Line for Railway Water Supply with Some Costs.*

The works described here were developed to supply water for locomotives and other railway purposes for some 128 miles of the El Paso & Southwestern Ry. in New Mexico. They comprise a 422,000,000-gal. storage reservoir, three 2,500,000-gal. service reservoir and 135 miles of 16-in. to 3½-in. pipe line. Only the pipe line work is described here.

Starting at the storage reservoir at the elevation of 7,728 ft. the pipe line has the profile shown by Fig. 1. The line first strikes the railway from inland at Coyote, thence it follows the line. To Coyote the line is a gravity line; thence to Corona the water has to be pumped; from Corona to Santa Rosa the flow is again by gravity. A study of the profile developed a system of hydraulic grades, pipe diameters, and open stand-pipes limiting the pressure to 130 lbs. per sq. in., except on 19 miles of the pump main between Coyote and Corona where the estimated maximum pressure is 310 lbs. Investigation justified the assumption that wood pipe under a pressure of 130 lbs. would give satisfactory service for 25 years, on which basis it would be less expensive than cast iron, and therefore it was used. Cast iron was considered preferable to steel for pressures not exceeding 310 lbs. on account of its greater durability.

Wood Pipe.—Machine made, spirally wound, wood stave pipe, made in sections from 8 to 12 ft. long, with the exterior surface covered with a heavy coat of asphalt, was selected in preference to unprotected, continuous stave pipe. The diameters were not so great as to require the latter. The first 40 miles of wood pipe was furnished by the Wykoff Wood Pipe Co. of Elmira, N. Y., and the Michigan Pipe Co. of Bay City, Mich., delivered the remaining 76 miles.

The pipe is wound with flat steel bands of from 14 to 18 gage and from 1 to 2 ins. wide. The machine winds at any desired pitch and tension. At each end the spiral wind is doubled two turns, the second lying over the first and developing a frictional resistance similar to that of a double hitch of a rope around a post. The ends of the band are held by screw nails or a forged clip, the latter being the better. It has two or three spikes on the under side which seat into the stave, and two side lugs on top which turn down over the band. The latter passes twice over the seat on the clip, the first turn holding the clip to the stave, while the second turn is held by the lugs, which are hammered down over it. The end of the band is then turned back over the clip and held down by a staple. The staves are double tongued and grooved and from 1⅜ to 2 ins. thick. The smaller thickness is sufficient. The exterior face of the staves should be turned concentric with the axis of the pipe and form a circle, so that the band will have perfect contact with the wood. The joints are formed by turning a chamber in one end of the pipe and a tenon on the other, or both ends are turned to a true exterior circle and driven into a wood or steel sleeve. The chamber and tennon were used in this work. Finally each piece of pipe is covered with as much hot asphalt as it will carry.

The specifications required bands of mild steel, of 60,000 lbs. strength, with an elastic limit half as great. The winding was spaced to limit the tension to 15,000 lbs. per sq. in. If severe water hammer is present, the ordinary working stress should be materially less than the latter, otherwise the spiral bands will stretch enough to permit the water to spurt out between the staves. This was determined to be true on 4,500 ft. of 12-in. pipe connecting the Carrizozo Reservoir with a water column at the roundhouse there. In pumping tests at the mills, attempts were made, at various times, to burst the pipe, but they never succeeded. Before the elastic limit was exceeded, the water was running out between the staves as fast as the pump forced it in. On the following day, pipe thus tested would carry the pressure for which it was designed without leaking. Except for defects in the band, pipe of this kind will not burst in the service for which it is properly designed. This is true, without exception, of the 100,000 pieces of pipe in this service.

There has been some trouble with a number of the riveted splices on the banding. Such a splice occurs for every spool of banding used. In every case where one of these splices has pulled apart, the break was the result of defective riveting, permitting the rivets to pull out. In no case has a rivet been found sheared off, and even one good rivet appears to be sufficient to prevent rupture. The explanation is found in the high frictional resistance between the band and the pipe, which distributes the weakness of a bad splice over several adjacent turns of the band around the pipe. The band loosens a few turns only on either side of a parted splice, generally not more than three. In no case has any pipe been removed from the trench, repairs being made without interruption to the flow of water. It is desirable to substitute welding for the riveting of these splices. The trouble is not present with the round band, the wrapped splice of the latter giving practically 100 per cent efficiency.

The flat band was chosen for this work because it is the more effectively buried in and protected by the asphalt, and will not crush the soft wood staves under high pressure. The longevity of either the flat or the round steel band is dependent primarily on effective protection against contact with corrosive elements. Wrought iron should be used for this kind of service, and, for the same reason, for many other purposes.

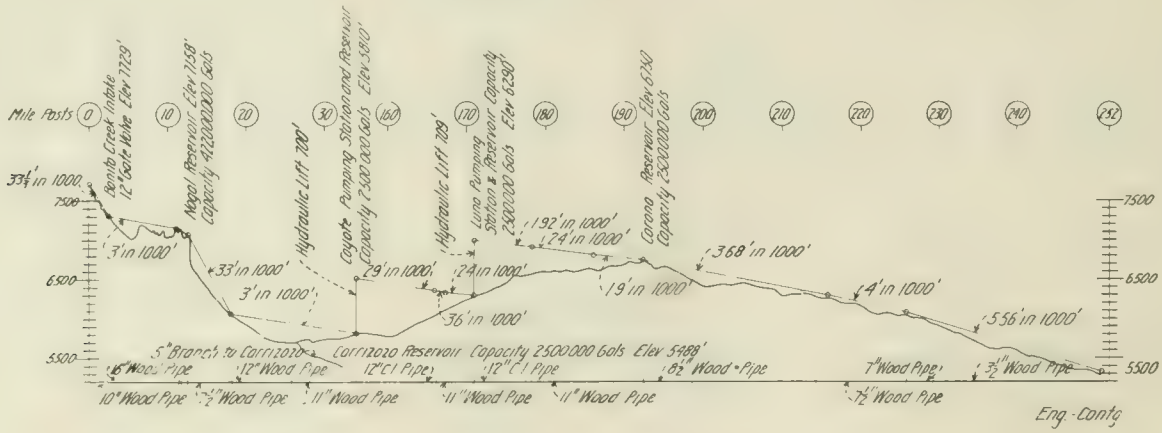
The staves of this pipe are of Michigan and Canadian white pine. This pine cannot now be had of clear stuff or in long lengths in large quantities, otherwise it is unexcelled. Douglas fir and yellow pine, coarser and harder woods, have the advantages of clear lumber and long length. Cypress is not as plentiful, and redwood is costly. The mill tests did not determine definitely the minimum degree of seasoning necessary, and press of time compelled the acceptance of some rather green lumber. Service tests do not show that there is any abnormal leakage from pipe made of such lumber, and it could not now be distinguished in the trench by such tests. Undoubtedly, however, thorough air seasoning should be required.

Owing to its small size, a part of the 3½-in. pipe was bored from the log. This was a mistake, for bored pipe has a rough interior and a reduced capacity. The inspection and culling are difficult and unsatisfactory, and imperfections readily apparent in a stave frequently escape detection in bored pipe.

The chamber and tenon of this pipe is an all wood joint, 4 ins. deep. An iron sleeve makes a better and stronger joint. It compensates for any lack of initial tension in the banding over the chamber of the wood joint, and secures full advantage of the swelling of the wood. Cast iron is better than steel; it is more rigid, and its granulated surface breaks up the smoothness of the wood surface swelling against it. One objection to the cast iron sleeve is that of cost, but it adds 4 ins. to the effective length of every section of pipe, as compared with the wood joints. On the Pacific Coast a banded wood stave sleeve is used with success.

To preserve the banding from corrosion and the wood from exterior decay, the pipe is thoroughly enveloped in refined asphalt having a flow point adjusted to the prevailing temperature during shipment and laying. One grade can be used through a considerable range of temperature. This coating endured a 2,000-mile shipment successfully. Each piece was carefully inspected along the trench and any break in the coating was thoroughly painted with hot asphalt. Enough of the latter came in barrels, with the pipe, from the factory.

The first 37 miles of this pipe has been in service for two years. Recent inspections show the coating to be in excellent condition and the steel underneath to be bright and clean. In some cases, where the initial pres-



Profile of 135 Mile Pipe Line for Railway Water Supply.

*Abstracted from a paper by J. L. Campbell in the Proceedings American Society of Civil Engineers, Vol. XXXVI, p. 531.

sure and leaking between the staves of the dry pipe were great, the escaping air and water lifted the coating into bubbles. At some points where this lifting was great enough to rupture the asphalt, and the soil is heavily charged with alkali, some corrosion has begun.

The integrity and impermeability of this asphalt coat are quite as vital as constant saturation. This coating protects the entire pipe from exterior contact with destructive agencies. With such effective exterior protection of the wood, this coated pipe has quite an advantage over continuous stave pipe.

Each piece of pipe goes directly from the winder to the asphalt rolls, then to an adjacent sawdust table, then back to the rolls, then to the table again, and then to the dry finishing rolls at the opposite end of the table. The coating thus consists of two layers of asphalt and two of sawdust. When the pipe leaves the finishing rolls, the coat is hard and smooth and about 3/16 in. thick. This describes the coating as done at Bay City, Mich.

At Elmira, N. Y., one application of asphalt through a bath of hot asphalt as it was wound, thus coating its under side also. This initial and sawdust only, without a finishing dry roll, completed the work; but the band was run treatment of the band on the Wykoff pipe is necessary because the exterior of the stave is neither planed nor turned to a circle. The exterior of the pipe forms a polygon and the band is in perfect contact only at the angles. The theory in regard to the Michigan pipe is that the perfect contact of the band and the wood on the true exterior circle excludes air from the under surface of the metal and prevents corrosion. Experience appears to justify this theory.

Cast Iron Pipe.—Beginning at the first pumping plant at Coyote, at Mile 156, and running up to Mile 166, and again commencing at the Luna pumps, at Mile 171, and extending up to Mile 179, the minimum pressure on those portions of the pump main is more than the 130 lbs. per sq. in. allowed for wood pipe, and the final estimated maximum pressures run up to 310 lbs. The selection of iron pipe for these pressures was, first, as between steel and cast iron, and, second, as between the lead joint of the standard bell and spigot pipe and the machined iron joint of the universal joint pipe. Again, the choice was as between lead and leadite for the bell and spigot pipe. Cast iron was selected because of the certainty of its long life and the bell and spigot pipe was selected on the basis of comparative costs for pipe laid. The standard lead joint was chosen on the result of tests. This cast iron pumping main has a diameter of 12 ins. throughout.

Makers of standard bell and spigot pipe urged the usual heavy weights selected for municipal service and heavy water hammer. Three pressures—viz.: 217, 260, and 304 lbs.—were used for the division of pipe weights, on which the standard pipe makers specified shell thicknesses of 0.82, 0.89, and 0.97 in. Eliminating water hammer and adopting a working stress of 2,400 lbs. the thicknesses are reduced to 0.54, 0.65, and 0.76 in. To make the latter conform to the specifications of the New England Water Works Association, the pipe was cast to 0.57, 0.65, and 0.77 in. The reduction in cost amounts to $52,811. By the provision of air cushions the writer's anticipation of no water hammer on the pumping main has been fully realized.

There was a question about the reliability of the lead joint at 300 lbs. The writer had a section of 12-in. pipe, with standard joints containing 22 lbs. of lead, laid and tested to 500 lbs. without sign of failure or leakage. The joints were calked down 3/16 in. below the face of the bell. Of 8,700 joints thus made in the field, not one has blown out or failed. A few weeped slightly on top, and they were made permanently tight by additional calking. The present maximum pressure is 278 lbs. These joints are the standard joints specified by the New England Water Works Association. It should be borne in mind that there is no water hammer on this line. In 8,700 joints, 198,000 lbs. of lead and 3,200 lbs. of oakum were used, or 22.76 and 0.37 lb. per joint.

Leadite was tested in competition with lead, but it leaked at 100 lbs. and failed under a sustained pressure of 300 lbs. It is a friable material, and cannot be calked successfully. Its principal ingredient appears to be sulphur. The failure was by slow creeping out of the joints. It is melted and poured, but not calked. It has attractive features for low pressures and for lines not subject to movement or heavy jarring.

Air Cushions.—To prevent water hammer on the pumping main, all pumps are provided with large air chambers. In addition and as the special feature for absorbing the shock of pumping under high pressure through a pipe 21 miles long, a large air chamber in the form of a closed steel cylinder, 5 ft. in diameter and 15 ft. long, is mounted on the pumping main outside of the pump house. This cylinder is set on its side, in concrete collars, directly over the pipe beneath, to which it is connected by a 12-in. tee, in which a 12-in. gate valve is set. The cylinder is provided with a glass gage, cocks, etc. It was designed for a working pressure of 300 lbs. and at each pumping plant it has proved to be entirely air and water tight. As indicated by sensitive gages on the pump main, just beyond these large air chambers, the latter absorb all the water hammer which gets beyond the air chamber on the pumps.

Pipe Line Leakage.—There is no measurable leakage from the iron pipe. By thorough inspection and measurement at the end of two years, leakage on the wood pipe, between Coyote and Bonito Creek, from the 11 and 12 in. pipe, was found to be as follows:

On 8.6 miles, 11-in. pipe, 146,600 gal. per day = 17,046 gal. per mile.
On 4 miles, 12-in. pipe, 14,829 gal. per day = 3,702 gal. per mile.

The 7½-in. pipe on this section appears to be leaking less than the 12-in. pipe. Inspection and measurement of it are to be made in a short time.

There is no material leakage from the 10 and 16-in. pipe between Bonito Creek and Nogal Reservoir, as determined by velocity and volumetric measurements. The greatest probable error in the velocity measurements would not exceed ½ per cent. If such error existed, and was all charged to leakage, it would amount to but 17,204 gals. per day, or 1,582 gals. per mile, out of a daily delivery of 3,784,000 gals.; but the measured discharge of the pipe, as determined by the velocity, was 5.84 sec. ft., while the mean maximum volume of this water over the weir at the end of the pipe is recorded by the weir as 5.88 sec. ft.

From Coyote east along the railway the wood pipe is remarkably tight. The rate of leakage from it, as determined by 600 observations uniformly distributed, was as follows:

11-in. pipe = 120 gal. per mile per day.
8½- and 7½-in. pipe = 268 gal. per mile per day.

The maximum rate on 1 mile was 1,613 gals. The minimum found was zero.

The observations were made by uncovering a joint and measuring the leakage therefrom for 10 mins. A graduated glass measuring to drams was used. The rate of leakage varied from 5 drops to 45 ozs. in 10 mins. Of the joints uncovered 57 per cent was found to be leaking. It is rather remarkable that, in the large leakage of the 11 and 12 in. pipe between Coyote and Bonito, only one out of every eight joints was leaking. This indicates a physical defect in such joints. The largest leak found on one joint was at the rate of 17,280 gals. per day. Leakage between or through the staves is not measurable, as it is not fast enough to come away in drops unless there is some imperfection in the wood.

The insignificant leakage of 120 gals. stated above is from the 11-in. pipe in the pumping main between Coyote and Corona. The present maximum working pressure on it is 100 lbs. per sq. in. All the figures given above include visible and invisible leakage, the latter being such as does not appear on the surface. The visible leakage is but a small part of the total.

Generally, any ordinary leak is readily stopped by pine wedges. Sometimes a loose joint requires individual bands bolted around it. Bran or saw-dust is effective in stopping the small leaks which cannot be reached by the wedges. The good effect of the latter is likely to be destroyed by a rapid emptying of the pipe. If the water is drawn out faster than the air can enter through the air-valves, heavy vacuums are formed down long slopes, and the air forces its way in through the joints and between the staves. The result is that the pipe will frequently leak badly for some time after it is refilled, although it may have been tight previously.

Pipe Breakage.—The breakage or damage to the wood pipe in shipment occurred on the ends, the tenons being most exposed to injury from shifting in the cars. The damage due to the shipment and handling of the Elmira pipe was 1 per cent and one-half as much for the Bay City pipe. Less than 6 pieces out of 100,000 laid, have had to be removed from the trench.

The iron pipe came from Chattanooga, and was badly handled in transit. Much of it was transferred en route, and 6 per cent was broken when received. The breaks were generally cracks of the spigot end. Of this broken pipe, practically all was cut and laid. The average cut was about 16 ins. from the spigot end of 533 pieces. This cut has caused no trouble in the trench.

At least 27 pieces of cracked pipe got past the field inspectors and into the trench. This cracked pipe began blowing out at a pressure of 50 lbs., and continued until the full normal pumping pressure was reached, when the breaks suddenly ceased. These pipes were broken out at the rate of 1 or 2 per day, with an occasional day between breaks. A 24-hour work-train service was maintained. The pipe gang soon became skilled, and could put in a new section of pipe in from 4 to 6 hours. Each break generally caused an interruption of about 6 hours to the pumps on the section where it occurred. The best record was 3 hrs. and 50 mins. from the stopping to the starting of the pumps. This strenuous life lasted 30 days. Most of these breaks were in or near the middle of the pipe. Evidently, the field inspectors were not expecting cracks in that locality. An inspection usually indicated that the pipe had been struck by the bell of another one in the vicinity of the break. All pipes were lifted from the car carefully and laid down at the trench along the track in a single movement by a logging crane, and were not broken in such handling. Three breaks only have been reported as due to defective metal or casting. No break of a sound shell of full thickness has been found.

Trenching.—Deep frosts are unknown in this section. The pipe was laid so that the top was about 1 ft. below the surface of the ground. The trenching was a simple matter. Part of the work between Bonito and the railway on the Carrizozo plain was done by Buckeye ditchers. All other ditching was done by a railroad plow followed by pick and shovel, or by the last two tools only. The ditcher could open 2,000 ft. of trench per day, but averaged about 500. The plow and 35 men could open 3,500 ft. A chain about 6 ft. long separated the end of the plow beam and the double tree. In this way the trench was plowed to the bottom. Two mules, two men and a scraper could back-fill 3,500 ft. per day.

Pipe Laying.—Between Bonito and the railway, one gang of ten men could lay 4,000 ft. of 12-inch pipe per day. The average was much less, owing to a variety of causes. At the end, the railway company added to the contractor's force, and laid the last 10 miles of pipe in 7 days, there being a half dozen separate gangs at work. Along the railway, the day's record on wood pipe was 4,000 ft. of 11-in., 6,200 ft. of 7½-in. and 8,345 ft. of 3½-in. pipe laid by a gang of eight men after the pipe was distributed along the trench. These eight men, of whom five were Americans, laid 76 miles of pipe, and became expert. Their operation was like the working of a clock.

On the 12-in. iron pipe, the regular day's work was 96 joints, or 1,152 ft. of pipe laid and caulked. The record was 1,644 ft. Two gangs laid 101,300 lin. ft. in 60 days. Such

a gang consisted of 1 foreman, 1 inspector, 8 caulkers, 4 yarners, 1 melter, 1 pourer, 1 helper and 10 men putting pipe into the trench.

Cost Data.—The pipe from Bonito to the railway was laid by contract. The price was 18 cts. per lin. ft. laid and back-filled from the railway to the Nogal Reservoir, and 28 cts. from Nogal to Bonito. In addition, 50 cts. per ton per mile was paid for hauling pipe, and extra compensation for setting valves. From Coyote, east along the railway, the work was done by the railway company under the writer's direction.

The total cost of laying 384,300 ft. of wood pipe, from 11 to 3½ in. in diameter, was $18,156.77, or 4.72 cts. per ft., divided as follows:

Ditching	$0.0249
Laying	0.0113
Back-filling	0.0110
Total	$0.0472

This includes unloading from the cars. Train service cost ⅓ ct. per ft. additional. The pipe gang, including back-filling, consisted of 1 foreman, at $100 per month, one assistant foreman at $75, and about 30 Mexicans at $1 per day. The rates were the same in the ditching gang. The plow team cost $6 per day. Including all general expense, the cost does not exceed 6 cts. per lin. ft.

The cost of laying 101,300 ft. of 12-in. cast-iron pipe was $23,826.67, or 23.5 cts. per ft., divided as follows:

Ditching	$0.0249
Laying	0.1180
Back-filling	0.0110
Lead	0.0790
Oakum	0.0014
Total	$0.2343

This includes train service and unloading pipe, but nothing for tools. The foreman and inspector received $100 per month, the caulkers, $3; pourer, $3; melter, $2.50; 2 pipe-men, $2, and laborers, $1 per day. Professional caulkers wanted $5 per day. Carpenters, blacksmiths, and boiler-makers made good caulkers; their work is standing perfectly under a 275-lb. service.

The cost of the pumping plants complete per horsepower is as follows:

	Per hp.
Pumps	$ 79.00
Boilers	18.70
Building	41.70
Total	$139.40

The approximate cost per million gallons of storage capacity is as follows:

Nogal Storage Reservoir	$ 103.00
Carrizozo Service Reservoir	3,040.00
Coyote Service Reservoir	2,880.00
Luna Service Reservoir	3,480.00
Corona Service Reservoir	2,720.00

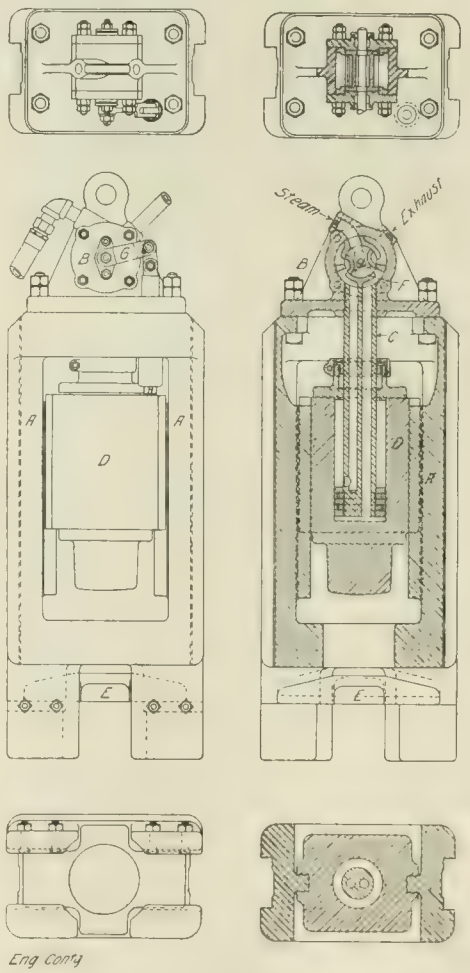
To cover general expense, 3 per cent should be added to all the costs above given. The costs per foot of pipe-laying include the setting of all specials, valves, and stand-pipes. The difference of cost in laying 11-in. and 3½-in. wood pipe is not nearly as great as the difference in diameter or the total quantity laid on record days. While the record is 4,000 ft. and 8,345 ft., the 76 miles of pipe of all diameters were laid in a total time, including all delays, of 223 days, or an average of only 1,723 ft. per day. The cost of the 11-in. pipe is covered by 7 cts. per ft. The pipe was laid by a single gang as fast as it was received from the factory.

A New Design of Steam Pile Driver.

The steam pile driver and the drop hammer pile driver have somewhat distinct fields of utility. For rapid driving of many piles close together the steam driver has, perhaps, superior advantages. Broadly, there are two types of steam pile drivers. In machines of the first type the steam acting under a piston raises a weight which is allowed to drop by gravity. In the second type of steam driver a double acting steam cylinder is employed; the steam after lifting the weight is turned and applied on top to propel the hammer downward at greater velocity than would result if it dropped by gravity alone. The steam driver illustrated by the accompanying drawings belongs to the second type described. It is the invention of A. A. Goubert of New York, N. Y., to whom we are indebted for the information which follows:

In the steam driver illustrated the novelty is introduced of making the piston and rod stationary and the cylinder movable. The cylinder forms the hammer. The reason given for this arrangement is that the percussion effects are taken by the heavy mass of the cylinder-hammer and do not affect the piston rod, pistons or other lighter parts. Referring to the illustrations: The driver consists of a heavy cast frame *A*, made to work in guides, which carries on its top a valve chest *B* from which is suspended rigidly the piston rod *C* and piston. The cylinder *D* is a heavy casting which slides on the piston rod and has on its bottom a nose or pene which strikes on a loose anvil *E* resting on the pile top. The bottom of the frame *A* sits over the head of the pile and at its top is an eye-ring to permit hoisting or lowering.

Referring to the construction in detail it will be seen that the piston rod *C* has two



Details of Goubert Steam Pile Driver.

bored channels which admit the steam alternately beneath and above the piston. This admission of the steam is controlled by a double D-valve *F* operated by a crank arm *G*, to the end of which is hung a weighted plunger *H*. When the cylinder nears the end of its up-stroke it hits and raises the plunger *H* which turns the valve so as to admit steam under the piston. The cylinder is forced down and strikes the blow and the percussion of this blow causes the plunger *H* to drop and reverse the steam to above the piston which forces the cylinder up again. Suitable springs in the plunger *H* prevent injurious shocks and regulate its movement.

As will be seen from the drawings this driver is notably free from fastenings likely to be loosened by concussion and the valve and valve actuating mechanism are comparatively simple and sturdy. The driver is made in three sizes, suitable for sheet piling 4 ins. thick up to round piles 18 ins. in diameter. The anvil block is cruciform so that it can be used for driving sheeting or round piles. Size No. 2 for 9 to 12-in. bearing piles has an 800-lb. ram and weighs altogether 2,000 lbs. The hammer strikes from 150 to 200 blows per minute. The height from top of pile to center of the lifting eye is 5 ft. 2 ins.

Cost of the New York Subway and of Operating It.

The underground railway in New York City, known as the Subway, is operated by the Interborough Rapid Transit Co., although the Subway is owned by the city. We shall consider the first cost of the Subway as it exists today, the cost of equipment and the cost of operation.

Contract No. 1, for construction and operation, was executed Feb. 21, 1900, with John B. McDonald, and provided for the construction of the present Subway (and its elevated portions) extending from the Postoffice to Kings bridge on the Broadway division and to 180th St. on the Lenox division. The contractor had to furnish the power plant and equipment (rolling stock) at his own expense. On Oct. 27, 1904, the first train was run from the Postoffice to 145th St.

As originally built under this contract (No. 1), there were 58 miles of single track in subway and tunnels and 11 miles of single track in the elevated portions, a total of 69 miles of single track, distributed as follows:

	Miles of Road-bed.	Miles of Tracking.
Single track line, arched tunnel	0.14	0.14
Double track line, standard	4.17	8.34
Double track line, arched tunnel	3.95	7.90
Double track line, in single tubes	1.36	2.72
Three track line, standard	2.20	6.60
Three track line, arched	0.17	0.51
Four track line, standard	5.64	22.56
Four track line, in double track arches	0.38	1.52
Five track line, standard	0.74	3.70
Eight track line, standard	0.25	4.00
Total subway	19.00	57.99

This is equivalent to an average three-track road.

In addition there were 2½ miles of elevated road on the West side and 3 miles on the East, or a total of 5½ miles of double track, or 11 miles single track elevated.

This includes all the lines from Chambers St. (Postoffice) to 230th St. on the Broadway (or West) side and to Bronx Park, 180th St., on the Lenox (or East) side.

The original bidding sheet contained the following items:

1,700,00 cu. yds. earth excavation.
921,000 cu. yds, rock excavation.
368,600 cu. yds. tunnel excavation.

2,989,600 cu. yds. total.
773,000 cu. yds. back fill.
65,000 tons steel.
7,900 tons cast iron.
489,000 cu. yds. concrete.
18,500 cu. yds. brick.
775,800 sq. yds. waterproofing.
6,640 sq. yds. vault lights.
305,380 lin. ft. of track.
48 railway stations (5 express).

Assuming that there were only 3,000 tons of steel and 2,000 cu. yds. of concrete per mile of double-track elevated, and charging all the rest to the subway, the following would be the quantities per mile of single track of subway for the 58 miles:

	Per mile single track.
Earth excavation, cu. yds.	30,300
Rock excavation, cu. yds.	15,900
Tunnel excavation, cu. yds.	6,360
Total excavation, cu. yds.	52,560
Backfill, earth	13,330
Steel, tons	835
Cast iron, tons	135
Concrete, cu. yds.	8,630
Brick, cu. yds.	220
Waterproofing, sq. yds.	13,380
Vault lights	114
Track (rails, ties, ballast, etc.), miles	1
Stations, number	0.7

NOTE.—Of the 58 miles of single track in subway, 12.6 miles were in arched tunnels or tubes, thus greatly reducing the total yardage of excavation, also reducing the steel.

There were only two bids on this entire work, and the contract was awarded (Jan. 16, 1890,) to John B. McDonald, for the lump sum of $35,000,000. The other bid was $39,300,000, by Andrew Ouderdouk. Since there were no unit prices bid, it is not possible to

give the exact cost of the subway as distinguished from the elevated part of this railway. Assuming, however, that the elevated portion (5½ miles double track) cost as little as $2,000,000, we have $33,000,000 left for the 58 miles of single track in the subway portion, or nearly $570,000 per mile of single track subway. Note, however, that exceedingly high prices would have to be applied to every item to give any such total. Unquestionably such high prices were used by the contractor, and that he was able to bid high was largely due to the nature of the contract, whose great size eliminated competition of smaller contractors. Moreover, the contractor bound himself to operate the Subway for 50 years after its completion, to install an electric power plant and to furnish adequate equipment, none of which was embraced in his $35,000,000 price. Since this was the first project of its kind in America, the problematical nature of the financial success affected the bidding price.

Under Contract No. 1, the following has been the cost to the city up to June 30, 1908:

Original contract	$34,483,000
Extra work	5,544,428
Total paid to contractor	$40,027,428
Terminals	1,750,000
Real estate	2,368,527
Interest on corporate stock	3,695,166
Total	$47,841,121

Contract No. 2, the Brooklyn extension of the Subway, was awarded July 21, 1902, to the Rapid Transit Subway Construction Co., with which Mr. McDonald was allied. The price was $2,000,000 for the construction plus $1,000,000 for real estate. The contract price was far less than the actual cost, for the Rapid Transit Co. desired to control the situation. It is claimed by the company that they expended $10,000,000 in excess of the amount received from the city. This Brooklyn extension (Contract No. 2) involved building a double track line from the Postoffice to the Battery, a tunnel under the East River and a subway to the intersection of Flatbush and Atlantic avenues, Brooklyn, a total distance of about three miles.

The cost to the city, under Contract No. 2, has been as follows up to June 30, 1908:

Original contract	$1,803,530
Extra work	1,281,611
Total paid contractor	$3,085,141
Real estate	$1,805
Interest on corporate stock	282,400
Total	$3,449,346

This makes the grand total of Contracts Nos. 1 and 2 amount to $51,290,467.

The cost has been exceedingly high, and is not a safe criterion by which to judge the probable cost of similar work in the future, even in New York City. The only published data of actual cost to the contractor are to be found in ENGINEERING-CONTRACTING, Feb., 1906, reprinted in the second edition (1910) of Gillette's "Handbook of Cost Data." These units costs show that the subway work, expensive as it has been, has cost far less than the city has paid.

As for the equipment, the contracts provided that 3-car trains should be run on the local lines at 2-min. intervals, and 4-car trains on the express lines at 5-min. intervals, that each car should seat at least 48 people, that express trains should be able to maintain a schedule speed of 35 miles per hour, including 10 secs. stops every 1½ miles. Local trains were to have a schedule speed of 15 miles per hour.

The motor cars first installed were provided with two 200 HP. motors, or 400 HP. each, and a loaded motor car weighed 43½ tons. A trailer car weighed 33 tons loaded.

The power house was 211x693 ft. x 123 ft. high, total nearly 18,000,000 cu. ft. The cost has not been made public.

The power originally provided was 11 generators of 5,000 K. W. each, or a total of 55,000 K. W.

The first order placed for power plant machinery (in 1901) was as follows:

6—5,000 KW. alternators.
3—250 KW. exciters.
26—1,500 KW. converters.
78—558 KW. transformers.
8—motor-generator starting sets.

It was stated that the price of this electric equipment was $1,500,000, which is equivalent to $50 per K. W. of generator power.

The equipment (rolling stock) consists of 850 cars, of which 500 are wooden and 350 steel. The cost of the wooden bodies was $3,350 each, and the cost of the steel bodies was $5,500 each. About 60 per cent of the cars are motor cars, the rest being trailers. The total cost of these cars, including their electrical equipment, is reported at $8,650,058, which is a little more than $10,000 per car.

The Interborough Rapid Transit Co. reports to the Public Service Commission, June 30, 1908, that the electrical plant, land and equipment had cost them as follows:

1.	Engineering and superintendence	$ 487,030
2.	Electric line construction	4,552,796
3.	Buildings and fixtures used in operation of road	4,571,822
4.	Power plant equipment	6,140,776
5.	Shop tools and machinery	70,182
6.	Cars	8,650,059
7.	Miscellaneous	709,655
	Total "equipment"	$25,182,320
8.	Real estate used in operation	1,417,728
	Total "equipment" and real estate	$26,600,048

If we add to this the $51,290,468 paid for construction by the city, we have a total of $77,890,516, not including the $10,000,000 said to have been lost by the contractors on Contract No. 2, above mentioned.

On the basis of a 55,000 K. W. power plant, we see that the plant cost as follows:

	Per KW.
Electric line construction	$ 83
Buildings and fixtures	83
Power plant equipment	112
Real estate	25
Total	$303

The mileage operated in 1908 was as follows:

	Miles.
First track	24.63
Second track	24.00
Third track	13.77
Fourth track	7.50
Total trackway	69.90
Sidings and turnouts	9.35
Total track	79.25

In round numbers, therefore, it would appear that the Subway system has cost more than $1,000,000 per mile of single track, including power plant and rolling stock. However, the enormous traffic accounts in large measure for this cost, since 33 per cent of the total first cost is charged to power plant, rolling stock, electric line, construction, etc. Since the $26,600,000 expended for this purpose provides for power plant and equipment that delivered 44,000,000 car miles in 1908, we have an investment in power plant and equipment amounting to about 60 cts. per annual million car miles. Statistics given in Gillette's "Handbook of Cost Data" (1910 edition) show that the rolling stock alone of the street railways of Massachusetts cost 26 cts. per annual million car miles. If we consider merely the $8,650,000 worth of rolling stock on the New York Subway, we see that it amounts to less than 20 cts. per annual million car miles. Therefore, what seems at first to be an almost incredibly high first cost of equipment, proves to be reasonable when measured in terms of the service it performs.

The Subway began operation in 1905. The operating expense for 1908 was as follows:

	Maintenance of Way and Structures:	
1.	Track and roadway	$ 361,476
2.	Electric line	79,587
3.	Buildings and fixtures	74,230
4.	Undistributed expense	27,620
	Total maintenance of way	$ 542,913
	Maintenance of Equipment:	
5.	Steam plant	$ 100,379
6.	Electric plant	21,054
7.	Cars	365,004
8.	Electric equipment of cars	378,231
9.	Shop expenses	62,023
10.	Undistributed expense	16,487
	Total maintenance of equipment	$ 943,178
	Operation of Power Plant:	
11.	Wages	$ 210,501
12.	Fuel	683,915
13.	Water	67,703
14.	Lubricants and waste	20,846
15.	Miscel. supplies and expenses	29,891
16.	Undistributed expense	42,366
	Total operation of power plant	$1,055,222
	Operation of Cars:	
17.	Superintendence of transportation	$ 20,498
18.	Wages of conductors	571,379
19.	Wages of motormen	215,690
20.	Wages of miscel. car service men	146,322
21.	Wages of car house employes	50,007
22.	Car service supplies	45,587
23.	Miscel. car service expense	40,815
24.	Hired equipment	425,366
	Total operation of cars	$1,515,664
	General expenses:	
25.	Salaries, gen. officers and clerks	$ 133,287
26.	Printing and stationery	7,927
27.	Miscel. office expense	18,531
28.	Miscel. general expense	27,505
29.	Damages	61,437
30.	Legal expense due to damages	29,503
31.	Miscel. legal expense	58,743
32.	Insurance	19,354
	Total general expense	$ 366,337
	Grand total	$4,423,313

The total car miles was 44,005,213. The cost of operation per car mile was 10.05 cts., and can be estimated in cents per car mile with sufficient accuracy by multiplying any of the above 32 items (expressed in millions) by 2.25.

The following is a summary of the cost:

	Per car mile, etc.
Maintenance of way and structures	1.18
Maintenance of equipment and power plant	2.22
Operation of power plant	2.38
Operation of cars	3.58
General expense	0.69
Grand total	10.05

The following statistics of the year's operation are of interest:

555,271 car miles per mile of all track.
30,538 car hours per mile of all track.
2,529,209 passengers per mile of all track.
199,740,688 passengers at 5 cts. each.
699,000 passengers at 4 cts. each.

The motor cars have two 200 HP. motors, and weigh 43½ tons loaded. A trailer weighs 33 tons loaded.

There were 850 cars (60 per cent of which were motor cars). The cost of maintenance of this equipment was $821,744 ÷ 850 = $967 per car for the year 1908. The cars averaged a first cost of $10,000 each; this cost of maintenance was nearly 9.7 per cent for cars that were almost new.

Since 44,005,213 car miles were traveled by these 850 cars, the average was nearly 51,800 miles per car per year, or 143 miles per day.

Since maintenance of power plant cost $121,433, we have a maintenance cost of only about 2 per cent, but it must be remembered that this is a new plant, and that the maintenance costs are steadily rising, being twice as great in 1908 as they were in 1906.

In 1908, some 50 steel cars were built and electrically equipped at a cost of $13,930 per car. A recent report of the Philadelphia Rapid Transit Co. states that the steel motor cars used on their elevated roads have cost $12,500 complete.

In a subsequent issue we shall give the cost, per K. W. hr., of electric power developed for operating the Subway.

LETTERS TO THE EDITOR.

A Criticism of the Engineering Management of the U. S. Reclamation Service.

Sirs: I note that Senator Heyburn has introduced a resolution calling for a statement of the estimated amount of money which will be required to complete all the irrigation projects begun by the Federal Government. It will probably devolve upon the present heads of the U. S. Reclamation Service to furnish that information. I desire to call your attention to the fact that the present engineers are the same who made the original estimates for the service. It is estimated that the administration of Mr. F. H. Newell has been inefficient, which I believe is well founded.

The article from which I gleaned the following information states that Mr. Newell should have known the amount of money available for the Reclamation Service, and governed himself accordingly. The excuse offered for the deficiency, by his supporters, is "the increase in the cost of labor and materials," which I claim does not apply. My assertion is based upon the

fact that much of the work let under contract was done when the low prices prevailed; this being the case, the cost to the Federal Government would not be increased, but would fall upon the contractor.

I assert as a constructing engineer and contractor that I believe the real cause for the cost of the reclamation projects so exceeding the estimates is chargeable to the ineompetency of the Reclamation Service engineers, and can be summed up under the following subjects: (1.) The employment of inexperienced engineers. (2) Commercializing the profession. (3) Insufficient pay for competent engineers. (4) Inability of the head of the department of the Reclamation Service to see and correct these conditions.

At previous times and now the U. S. Reclamation Service has employed many competent engineers, but they are not retained long, for the reasons above stated.

In general, therefore, the basis of estimates has been wrong. Contractors upon these projects have been greatly abused and dealt with by sharp practices in order to keep down costs. Many have become bankrupt, and many have not yet received fair and just estimates, and therefore settlements are pending. Now the well informed contractors of the country realize these conditions and will not bid a reasonable price upon government work under the Reclamation Service.

I do not believe the present personnel of the Service can any more estimate the costs of work under their management today than they could at the beginning.

For your further information I will cite the following: draw your own conclusions: On Feb. 1, 1906, bids were submitted by numerous contractors upon the construction of the Payette-Boise Project, Idaho. Messrs. Conway & Willhite were the successful bidders on Schedule 3 Main Canal from Indian Creek to Deer Flat Reservoir. The contract was granted and upon the basis of the engineer's estimate amounted to a liability of $95,400.00; owing to change of plans and erroneous classification in the original estimate, these contractors were paid a total of $224,588.85, or over 135 per cent more than was originally estimated. The records of the Reclamation Service will show the truth of this statement. Many similar cases are available.

Yours respectfully,

H. D. PAGE.

Boise, Idaho, March 30, 1910.

Automatic Regulating Dams.

Sirs. In reply to Subscriber's query in your issue of March 23, regarding any form of automatic sluice or flood gate, will say: A gate designed by the writer for use in the Peri-Yar District in India may fulfill his requirements. The gate which was 6 ft. square was swung on a horizontal axis consisting of an iron rod 2 ins. in diameter and firmly fastened to the gate 18 ins. from the bottom. It worked in oiled grooves on the side, and was so weighted at the bottom that when the water started to flow over the top, the gate overbalanced and assumed a horizontal position down stream with the water. When the pressure was relieved, the overweighted bottom pulled the gate into position. This gate could be adapted if necessary, so that the top portion would swing up stream as Subscriber mentions but would not allow the passage of driftwood and other debris, which would be caught between the gate and the floor.

A novel type of automatic regulating gates for dams was used in the Bhatgur dam in India, designed by Mr. J. E. Whiting, M. Inst. C. E. The gates are balanced by counter-weights in pockets in the masonry similar to the usual window weights, and as the water raises it flows into those pockets by means of little holes. This water reduces the weight of the counterpoises and the gate sinks into a slot. As the water recedes, the pockets are emptied and the counter-weights pull the gate back into position again.

A type of gate designed to allow flood waters to pass over it and very commonly used in Australia, is shown at page 238 of Wilson's "Irrigation Engineering." The advantages of this gate are first, that it allows flood water and drift wood to flow over the top; second, the amount of water released can be easily regulated, and third, in opening the gate the clear water is drawn off leaving the silt at the bottom. By means of a rocker nut on the wheel shaft, many adaptations of this gate can be made.

While not automatic, a series of 31 quick opening gates was used in the Lake Avalon dam, Pecos Valley, New Mex. The gates were hinged at the side like a door, and could be opened by the stroke of a hammer on a latch bar at each gate and the water flows through them immediately. To close them, flash boards were placed on the inner side to take off the pressure. Details of this gate can be seen in the "Engineering News," Sept. 17, 1896.

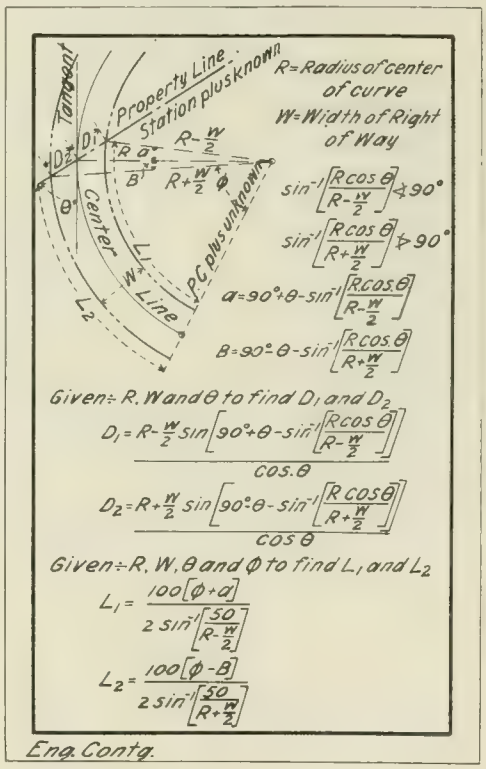
None of these gates mentioned are absolutely water tight.

W. D. ROHAN.

634 22nd Street.
Denver, Colo., April 4, 1910.

How Should a Draftsman Read These Notes?

Sirs: Concerning the letter under the above title from Sutphen, W. Va. (Eng.-Contg., March 2, 1910) showing a difference of opinion between a transitman and a draftsman, I would say that it was an error on the draftsman's part not to notice that the sum of the angles did not equal 180°. I think, however, that the transitman should have shown in his notes the angle to the



Tangent
Property Line
Station plus unknown
R=Radius of center of curve
W=Width of Right of Way
Center Line
P.C. plus unknown
Given:- R, W and θ to find D1 and D2
Given:- R, W, θ and Φ to find L1 and L2
Eng. Contg.

tangent to the curve at the point of intersection. I disagree with him when he says he would have to turn two angles, one depending on the other. The station plus of the point of intersection fixes the deflection of sta. 44 from the P.C. or the P.T. of the curve. Had he turned the angle from the P.C. or the P.T. to the intersecting tangent and subtracted the deflection angle, it would have given him the required angle, and that with one reading of the vernier. To avoid such disputes as he mentions, the general rule should be to always turn the tangent angle. Remembering, of course, that every rule has its exceptions.

I enclose a small blue print (made to fit in a field book) of some formulas which may be useful to your readers. In making right-of-way sketches to be attached to deeds where the description follows the boundary, it is necessary to calculate the distance shown on the blue print. The values of D_1 and D_2 are correct whether Theta is forward angle to the right or left. The values of L_1 and L_2 are based on the general

curve formula, $L = \frac{100 \text{ delta}}{\text{degree of curve}}$

I would like to have the opinion of others as to whether the length as I use it, or the actual length of arc, should be used. I base my opinion on the fact that in all other cases curve lengths shown are calculated from the formula above given.

Unimportant as these matters are, they are the subject of more or less discussion in the office.

M. C. HUTCHINS,
Chief Draftsman Waynesburg & Blacksville St. Ry. Co.
Waynesburg, Pa., March 3, 1910.

Personals.

Mr. W. W. Wallace, advertising manager of the Berger Manufacturing Co., Canton, O., died on March 29, 1910.

Mr. L. H. Conklin, recently general manager of the Scranton Electric Co., Scranton, Pa., has been engaged by J. G. White & Co., New York City, as engineer in its operating department. Mr. Conklin was educated at Pratt Institute, Brooklyn, N. Y., and has had a wide experience in electric operating and construction work. He is a member of the American Institute of Electrical Engineers.

Caleb Wheeler Durham, Civil Engineer, died Monday, March 28, 1910, at Peekskill, N. Y., in the 63d year of his age. He was born Feb. 6, 1848 at Tunkhannock, Pa. As a young man he served in the Civil War as a private, first in the 42d Regt. Pennsylvania Volunteer Militia in 1863, and in the 195th Regt. of the same state in 1864. He subsequently studied at the University of Michigan, in the class of '69 and commenced work as an assistant engineer in the employ of the New York Central Railroad. In 1872 he was principal Assistant Engineer on the location of the Texas and Pacific Railroad in Arizona and New Mexico. The previous year he was engineer in charge of construction of a section of the Chicago and Northwestern Railroad and subsequently in general practice in Chicago as engineer and surveyor. He invented an improved hot air furnace embodying the principles now recognized as essential in the best types of furnace, and a system of hot air heating and ventilation, and in 1880 invented and afterward carried on business of installation of the Durham System of house drainage, consisting of wrought iron or steel pipe with special threaded fittings, now almost universally employed in large buildings. On the recommendation of Col. Waring he installed the entire drainage system in the Capitol at Washington. He married May 28, 1873, Clarissa Safford Welles of Ann Arbor, Michigan, who died in 1907. They are survived by four sons. Mr. Durham was a member of the Chi Psi fraternity, one of the early members of the Civil Engineers' Club of the Northwest and a charter member of the Engineers' Club of New York. For 19 years he was a member of the American Society of Civil Engineers.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

Engineers' Office and Field Instruments and Supplies.—Paper folder, 3½x6 ins., 9 pp. The Engineering Agency Supply Dept., Monadnock Block, Chicago.

Concrete Separator.—Paper, 3½x6 ins., 12 pp. Concrete Separator Co., 1123 Broadway, New York City.

Illustrates and describes a simple device for separating wall forms in concrete work.

"Industrial" Railway.—Paper, 3½x6 ins., 80 pp. C. W. Hunt & Co., 45 Broadway, New York City.

This pamphlet deals briefly with the mechanical principals and interesting details of narrow-gauge track and rolling stock.

Glyco Metal.—Paper, 4½x7¼ ins., 80 pp. Joseph T. Ryerson & Son, 16th and Rockwell Streets, Chicago, Ill.

A description of this metal with useful information and rules for users of bearing metal.

Tool Steel.—Paper, 4½x7½ ins., 64 pp. Joseph T. Ryerson & Son, 16th and Rockwell Streets, Chicago, Ill.

A description of the various lines of high-grade tools handled by this company, together with directions for treating to insure best results.

Ore Grinding Machinery. The Evans-Waddell Chilean Mill. Paper, 6x9 ins., 14 pp. Bulletin No. 29 of the Power & Mining Machinery Co., Milwaukee, Wis.

Rock Crushing Machinery.—Paper, 6x9 ins., 70 pp. Catalog No. 4. Power & Mining Machinery Co., Milwaukee, Wis.

A description of the McCully Gyratory Crusher, with design for small, medium and large sized crushing plants.

Engineering-Contracting Monthly Review Index of Civil Engineering Literature.

A classified index and review of the civil engineering papers, articles, reports, pamphlets and books published during the month just passed is given in the succeeding pages. The literature indexed and reviewed—with the exception of books—relates solely to civil engineering. In the section devoted to Book Reviews all books in all branches of engineering are listed as received and such of them as seem worthy are reviewed as fully as due regard for conciseness will permit. In choosing books for review rigid selection is exercised. Next to careful choice of books for review timeliness of review is sought. All books are reviewed within a month of their receipt. The same statement is true of the articles and papers that are indexed. Also, as in choosing books for review, the choice of articles and papers for indexing is based on merit. Numerical strength in "titles indexed" is not sought; excellence of selection is sought.

The purposes of the Monthly Review Index are: First, to inform civil engineers and contractors of the articles and papers of merit that are published each month, in such a way as will give a clear idea of their character and scope; second, to supply the user with the date and place of publication, the length of each article and the cost at which it can be secured. The name, adopted abbreviations, place of publication and price per number of each periodical examined for civil engineering articles are given in the list immediately following. The other information is given in the index proper for each article separately.

Books reviewed will be sent post paid on receipt of price by the Book Department of ENGINEERING CONTRACTING; periodicals, etc., containing articles indexed should be ordered direct from the publishers.

LIST OF PERIODICALS INDEXED.

American Architect (Am. Arch.), New York, N. Y.; w; 7x10 in.; 15 cts.
American Builders' Review (Am. Bldrs. Rev.), San Francisco, Cal.; m; 7x10 in.; 50 cts.
American Carpenter and Builder (Am. Car. & Bldr.), Chicago, Ill.; New York, N. Y.; m; 7x10 in., 20 cts.
American Engineer and R. R. Journal (Am. Engr. & R. R. Jl.), York, N. Y.; m; 7x10 in.; 20 cts.
American Gas Light Journal (Am. G. L. Jl.), New York; N. Y.; w; 10x13 in.; 10 cts.
American Institute of Electrical Engineers Proceedings (Am. I. of E. E. Proc.), New York, N. Y.; m; 4x7 in.; 50 cts.
American Machinist (Am. Mchst.), New York; w; 7x10 in.; 15 cts.
American Society of Civil Engineers Proceedings (Am. Soc. C. E. Proc.), New York, N. Y.; m; 4x7 in.; 75 cts.
American Society of Mechanical Engineers Journal (Am. Soc. M. E. Jl.), New York, N. Y.; m; 4x7 in.; $1.
Annales des Ponts et Chaussees (An. P. & C.), Paris, France; m.
Applied Science, Toronto, Ont.; m; 6x9 in.; 30 cts.
Architects and Builders Journal (Arch. & Bldrs. Jl.), Baltimore, Md.; m; 9x13 in.; 20 cts.
Architects and Builders Magazine (Arch. & Bldrs. Mag.), New York, N. Y.; m; 5x8 in.; 20 cts.
Architect and Engineer of California (Arch. & Engr.), San Francisco, Cal.; m; 5x7 in.; 15 cts.
International Railway Congress Bulletin (Int. Ry. Cong. Bul.), Brussels; m; 50 cts.
California Journal of Technology (Cal. Jl. of Tech.), Berkeley, Cal.; m; 4x7 in.; 35 cts.
Canadian Architect (Can. Arch.), Toronto, Ont.; m; 7x19 in.; 20 cts.
Canadian Cement and Concrete Review (Can. Cem. & Conc. Rev.), Toronto, Ont.
Canadian Engineer (Can. Engr.), Toronto, Ont.; w; 7x11 in.; 20 cts.
Canadian Machinery and Manufacturing News (Can. Mach. & Mfg. News), Toronto, Ont.; m; 7x10 in.; 15 cts.
Canadian Mining Journal (Can. Min. Jl.), Toronto, Ont.; bi-w; 7x10 in., 20 cts.
Canadian Municipal Journal (Can. Mun. Jl.), Montreal, Que.; m; 6¾x10 in.; 10 cts.
Canadian Society of Civil Engineers Proceedings (Can. Soc. C. E. Proc.), Montreal; m; 4x7 in.; 50 cts.
Carpentry and Building (Carp. & Bldg.), New York, N. Y.; m; 11x8 in.; 10 cts.
Cassier's Magazine (Cas. Mag.), New York; m; 5x8 in.; 35 cts.
Cement, New York, N. Y.; bi-m; 5x8 in.; 35 cts.
Cement Age (Cem. Age), New York, N. Y.; m; 4¾x8 in.; 15 cts.

ROAD AND STREETS.

Method and Cost of Road Surfacing with 2-in. Concrete Cubes.—Eng.-Contg., March 2, 1910, ½ p.; Eng. News, March 3, 1910, ⅔ p.

Describes an interesting method of road construction using 2-in. concrete cubes. Methods of construction and costs are given.

Concrete Pavement Construction at Richmond, Ind.—Eng.-Contg., March 2, 1910, ½ p.

A brief description of the several constructions of concrete pavement that have been used in Richmond, Ind., since 1896. Methods of construction are stated and notes given on durability.

Work of the Municipal Asphalt Repair Plant of Brooklyn, N. Y., in 1909, with Detailed Costs of the Repair and Maintenance of Asphalt Pavements.—Eng.-Contg., March 16, 1910, 2 pp.

This article gives a complete statistical report of the work of the Municipal Asphalt Plant at Brooklyn, N. Y., for the year 1909. Tables are given summarizing the cost of maintenance work, cost of restoring pavement openings and cost of general maintenance of asphalt pavements. These costs are itemized and given in detail. The article is a valuable one for city engineers.

Suggested Standard Specifications for Macadam, Brick, and Granite Block Pavement, Creosoted Wooden Block Pavement and Concrete Pavement.—Eng.-Contg., March 9, 1910. 2¾ pp.; Eng. News, March 17, 1910. 2½ pp.

This is a reprint of the specifications decided upon at the convention of City Officials held in Chicago to draw up standard paving specifications. The specifications given cover all the different forms of pavement mentioned in the title.

Data on Steam Road Roller Practice in English County Councils.—Eng.-Contg., March 9, 1910, 1¼ pp.

This article gives actual records of steam road roller performance as determined by various county councils of England. These records will be found of value to American road builders.

Data on Street Cleaning in St. Louis, Mo.—Eng.-Contg., March 9, 1910, ⅔ p.

Gives statistics of the amount of street cleaning work in St. Louis, Mo., describes the organization and presents average unit costs.

Suggested Standard Practice for Pavement Bonds and Guarantees and Suggested Specifications for Asphalt and Bituminous Pavements.—Eng.-Contg., March 23, 1910, 3 pp.; Eng. News, March 10, 1910, 1 p.

This is a reprint of the report produced at the Chicago Meeting of City Officials for Standardizing Paving Specifications on the subject named in the title.

Some Methods and Costs of Oiling Roads in St. Louis with a Description of a New Construction Employing Molded Slabs of Bitumen and Aggregate.—Eng.-Contg., March 23, 1910, 2⅔ pp.

This is an exceedingly interesting article giving blank forms for keeping records and costs of oiling roads. A special method of asphalt macadam road construction using thin molded slabs of asphalt is described.

Cost Data on Macadam and Gravel Roads Construction in Peel County, Ontario.—Eng.-Contg., March 30, 1910. ½ p.

Describes briefly methods of constructing a number of crushed stone and gravel roads and gives itemized cost of this construction.

Method and Cost of Snow Removal in St. Louis, Mo., by Flushing it Through the City Sewers.—Eng.-Contg., March 30, 1910, 1⅓ pp.

Describes method followed in disposing snow by flushing it through the city sewers at St. Louis, Mo. A map is given showing the location of the snow traps and details of the snow trap construction are also illustrated.

Experimental Work of the New York State Highway Commission.—Eng. Rec., March 12, 1910.

Summarizes data obtained in experiments made to determine the cost and effectiveness of certain materials and methods for building and resurfacing roads. Glutrin, bituminous macadam, concrete cubes, asphalt macadam, and concrete constructions were experimented with and also various kinds of surface dressings.

Municipal Asphalt Plant, Kansas City, Mo.—Eng. Rec., March 5, 1910, 1½ pp.

Describes construction of a plant having a capacity of 7,000 sq. yds. of 2-in. topping per 8-hour day. A lay-out plan of the plant is given. The plant has several novelties in labor saving devices for storing and handling raw materials.

State Road Work in New York in 1909.—Eng. Rec., March 5, 1910, 2¼ pp.

Summarizes the report of the State Commission of Highways of its first year's work. The organization is outlined, and the adopted lines of improvement are explained for each class of highways. Under maintenance many data and some costs are given of work of oiling roads.

Standard Paving Specifications.—Mun. Jl. & Eng., Mch. 9, 1910. 3 pp.

Contains a report of the convention recently held in Chicago to standardize paving specifications and presents the specifications adopted for brick pavement; stone blocks; concrete work; concrete sidewalks; concrete curb and guter; pavement foundations; concrete pavements.

Bituminous Highway Construction.—By C. A. Kenyon. Cont., Mch. 1, 1910. 1½ pp.

Condensed from a paper read before the 1910 Annual Convention of the Indiana Engineering Society. Gives methods and costs.

Specifications for Sheet Asphalt Pavement, Bituminous Concrete Pavement, Concrete Sidewalks, Curbs, Gutters and Pavement and Creosoted Wood Block Pavement.—Mun. Eng. Mag., April, 1910. 10 pp.

The above are the specifications drawn up by the various committees of the "Organization of City Officials for Standardizing Paving Specifications," which held its first convention at Chicago, Feb. 21 to 26, 1910.

Some Curb Details.—Mun. Jl. & Eng., March 23, 1910. 1 p.

Contains descriptive matter and illustrations regarding high curbs in business and residence streets, steps in curbs, curb corner guards, and gives details of concrete curb and gutter with vitrified brick edge.

Pollution of New York Harbor.—By Kenneth Allen, Mun. Jl. & Eng., March 23 and 30, 1910. 6 pp.

The author describes in a general way the investigations that have been conducted by various state commissions to investigate the conditions attending the disposal of sewage in the metropolitan district. A considerable amount of data collected by the various commissions is given in the article.

Amount of Pavement in the United States.—Mun. Jl. & Eng., March 2, 1910. 10 pp.

Tables containing statistics concerning paving in all the cities of the country of over 30,000 population and in many cities of less size. The first table shows the amount of the several kinds of pavement in the United States in miles, up to the end of 1907. These figures were compiled by the U. S. Census Bureau. Another table compiled by the Municipal Journal and Engineer brings the figures up to Jan. 1, 1910. And still another table shows the amount in square yards and miles of the several kinds of pavement laid in 1910.

Wood Block Paving Specifications.—Mun. Jl. & Eng., March 2, 1910. 1 p.

The specifications adopted by the Board of Estimate and Apportionment of New York City for use in that city.

Asphalt Block Paving in Toledo.—By F. O. Consaul. Mun. Jl. & Eng., March 2, 1910.

The article describes the composition of the asphalt blocks and gives the specifications of the city of Toledo, O., for the blocks and their laying.

Redressing Granite Paving Blocks.—By S. C. Thompson. Mun. Jl. & Eng., March 2, 1910. 1½ pp.

Describes the method of repaving a portion of Webster Ave., New York City, with old granite blocks taken up and redressed with new heads. The manner of recutting the old blocks is illustrated.

Economics of Street Pavements.—Mun. Jl. & Eng., March 2, 1910. 2½ pp.

A valuable article discussing the comparative value of different kinds of pavement and showing how this value can be determined. Estimates on the costs of granite block pavements, sheet asphalt pavements and macadam pavements, and their comparative value and economy are given. The matter is taken from the reports of Samuel Whinnery to the Boston Finance Commission.

Street Paving.—Mun. Jl. & Eng., March 2, 1910. 39 pp., ill.

This is the annual "Paving Number" and the articles are on "Brick Pavements in Ohio," "Smooth Granite Block Pavements," "Economics of Street Pavements," "Wood Blocks," "Asphalt Pavements," "Amount of Paving in American Cities."

London Paving Materials.—Surveyor, March 18, 1910. 4 pp.

Notes taken from the 7th Annual Report of the Metropolitan Paving Committee of London, England. The notes treat of the kinds of pavement laid in the various districts of the city, and give some details regarding them. Tables are given showing the average initial cost of laying the several kinds of pavements, and the engineer's opinion as to the wearing qualities. Wood block appears to be the principal type of pavement laid.

Dustless Roads.—Surveyor, March 28, 1910. 2 pp.

The article, which is taken from the last issued report of the Dust and Dustless Roads Committee of the Royal Automobile Club, contains an interesting summary of the causes of dust. Figures are also given as to the amount of tar-mac and tar treated macadam in the several road districts.

A Comparison of Cost and Efficiency of Methods of Street Lighting.—By N. R. Birge. Mun. Eng. Mag., April, 1910. 5 pp.

The author gives comparative costs of operating an open arc system and series luminous arc rectifier system. Comparisons are also made between carbon, filament and tungsten incandescent lamps.

Detroit Municipal Asphalt Plant.—By Len G. Shaw. Mun. Jl. & Eng., March 2, 1910. 1 p.

Contains cost figures on the operation of the municipal asphalt plant of Detroit, Mich., for 1909.

Brick Pavements in Ohio.—Mun. Jl. & Eng., March 2, 1910. 12½ pp.

General descriptive articles dealing principally of the brick pavements constructed in the city of Cleveland, Cuyahoga County and Columbus. A description of the method of constructing the brick paved roads in Cuyahoga County is also given. Some data on the cost of operating the municipal asphalt operated repair plant at Columbus, O., is likewise included.

Smooth Granite Block Pavements.—By W. A. Howell. Mun. Jl. & Eng., March 2, 1910. 2½ pp.

Includes specifications for new form of granite block pavement, being close joints grouted with cement, laid in Newark, N. J., last year. In addition a considerable amount of interesting information is given regarding the construction of this type of pavement in Newark.

Asphalt Repairing in St. Augustine.—Mun. Jl. & Eng., March 2, 1910.

Describes the repairing of asphalt pavement at St. Augustine, Fla., with a portable plant and gives data on the cost of the work.

SEWERS.

Sewage Disposal Ideals.—By W. C. Easdale. Surveyor, March 11, 1910. 4 pp.

In this article the author points out the usefulness of all ordinarily accepted methods of sewage disposal, and makes many useful comments upon the various systems. He also brings out many practical points regarding general designs, details of construction and management. The discussion of the paper is given in the March 18 and 25 issues of The Surveyor.

Sewage Distribution Tests at Mount Vernon, N. Y.—By C. A. Hammond. Eng. News, March 24, 1910. 2½ pp.

Distribution accomplished by letting sewage fall in solid cylindrical streams from overhead nozzles and strike splash cups set 2 ft. above filter surface. Tests made to determine discharge of various sized nozzles and relative efficiency of spray distribution produced by splash cups of different form under various conditions. Results are given in tables and diagrams.

Sewage Treating Station of the Sanitary District of Chicago.—By Langdon Pearse. Eng. News, March 31, 1910, 5¼ pp.

Gives plans of sewage testing outfit of the station and details and views of special features of apparatus. The object of the investigations is explained, the testing plant and methods of conducting the test work are described and some results of the investigations are given.

Reinforced Concrete Sewer Bridge.—Eng. Rec., March 26, 1910. ¾ pp.

Bridge consists of two parallel reinforced concrete girders carried on piers 33 ft. apart and having joined between them and supported by them a 24-in. circular reinforced concrete conduit. Structural details are shown and described, method of construction outlined and itemized costs are given.

Necessary Elements for Water Works Valuation.—Eng. Rec., March 12, 1910. 1⅔ pp.; Eng. News, March 10, 1910. 1 p.

Outlines four common methods of valuation, discusses each and then outlines the elements to be considered in the method of valuation by reproduction. Describes first making of inventory and then outlines the requirements for close and just estimating from the inventory.

Large Storm Sewer Supported on Piers.—Eng. Rec., March 19, 1910. 1⅓ pp.

Shows section and views of rectangular reinforced concrete sewer supported by piers under the side walls. The structural portions are described with some account of the method of construction and a statement of bidding prices. The use of collapsible bents for the inside forms will interest contractors.

WATERWORKS AND HYDRAULICS.

Feather River Hydro-Electric Plant, Great Western Power Co.—Ry. & Eng. Rev., March 5, 1910, 3 pp., ill.

A description of the rebuilding and enlargement of a 60,000-hp. plant in California. The original tunnel was built nearly 30 years ago for gold mining purposes.

Laying 12 Miles of Pipe in Colorado.—Cont., March 1, 1910. 3 pp., ill.

An interesting description of the laying of 12 miles of 36-in. reinforced concrete pipe under exceptional difficulties in a mountainous country.

Structural Features of a 24-Mile Steel Pipe Line for the Portland, Ore., Water Works.—Eng.-Contrg., March 2, 1910, 1¾ pp.

Illustrates details of the 24-mile steel pipe line to be built for the Portland, Ore., water works. Gives abstracts of the specifications relating to various features of the pipe line work.

Plans and Specifications for Early Timber, Earth and Masonry Dams Built in Connecticut.—Eng.-Contg., March 9, 1910. 4¾ pp.

This article is interesting as presenting plans and sections of a large number of dams built in Connecticut previous to 1891. The several dams are briefly described and many extracts are given from the specifications controlling their construction.

Method and Cost of Constructing a Concrete Water Tower at Victoria, B. C.—Eng.-Contg., March 9, 1910. 2½ pp.

Describes a water works tower of reinforced concrete, 109 ft. high and 22 ft. in diameter. The methods of construction are described in detail and the forms for the concrete work are illustrated. Complete itemized unit costs of the work are given.

Method and Cost of Reforesting the Marginal Lands of the Wachisett Reservoir Metropolitan Water Works, Boston, Mass.—Eng.-Contg., March 23, 1910. 2 pp.

An interesting and somewhat unique article describing the methods employed in planting trees along the margin of a large water works reservoir. The methods of growing trees in nurseries and of replanting them are given in detail. Itemized costs of the work are also given.

Some Costs of Construction of the Cincinnati, Ohio, Filtration Plant.—Eng.-Contg.. March 30, 1910. ⅓ p.

Summarizes the costs of the main features of the Cincinnati Filtration Plant and compares these costs with the cost of the filter plant at Columbus, Ohio.

Construction of the Barker Dam.—Contractor, March 15, 1910. 4 pp.

Describes structural features and general methods of constructing a rubble concrete dam of 140,000 cu. yds. The contractors plant is described in some detail.

Partial Failure of Concrete Dam at Austin, Pa.—Eng. News, March 17, 1910, 2 pp.

Describes construction of and illustrates details of concrete dam 320 ft. long and 42 ft. high. Account of cracking and partial failure is given. Failure charged to unset concrete and to water getting under dam.

Action of St. Louis Water on Metals and Alloys.—Eng. Rec., March 19, 1910. 1⅓ pp.

The St. Louis water is treated with lime and sulphate of iron and this article presents test results of the action of this water on iron, zinc, alloys, copper and aluminum.

Construction of the Rainbow Falls Hydroelectric Development.—Eng. Rec., March 12, 1910. 4⅓ pp.

A description of the dam and hindworks construction of a water power plant operating under a head of 180 ft. The dam is a rock filled timber crib structure, 1,145 ft. long, and required some 5,000 M ft. of lumber, 5,500 cu. yds. of concrete and 50,000 cu. yds. of stone filling in its construction. The contractor's plant and general method of construction are described.

Ground Arch in Filler and Reservoir Construction.—Eng. Rec., March 12 and 19, 1910. 4⅓ pp.

A mathematical and economic investigation of the ground arch under the headings of volumes of elliptical ground arch units, effect of steel in groin unit, shrinkage and temperature changes, aid given by earth covering, construction stresses, floors, side and division walls, stub and beam construction. A very reliable paper on filter design.

RIVERS, HARBORS AND CANALS.

Structural Features of New Concrete Recreation Pier at Albany, N. Y.—Eng.-Contg. March 23, 1910. 2 pp.

Describes briefly and illustrates very completely the plans for a recreation pier having concrete bulkhead walls and boat-landings.

Relation of Forests to Stream Flow.—By Wm. W. Hurts. Eng. News, March 3, 1910, ¾ p.

Summarizes results of a detailed study of the records of the Tennessee and Cumberland rivers to determine effect of deforestation on floods. Records refute completely for these rivers the notion that there is any connection between deforestation and floods.

Influence of Floods on Climate and on Floods.—By W. L. Moore. Eng. News, March 3, 1910, 3⅓ pp.

Report of an investigation to determine the matter stated by the chief of the U. S. Weather Bureau. A very full discussion of the subject, leading to the conclusion that the run-off of rivers is not materially affected by any other factor than precipitation and that floods are neither of greater frequency nor magnitude since deforestation than before.

Movable Dam Across the Red River at St. Andrew's Rapids.—By H. P. Borden. Eng. Rec., March 26, 1910, 4¾ pp.

Notable as describing the first dam of the Camere curtain type to be constructed on this side of the ocean. The structural features are very fully described, some of the more important details are illustrated and the theory and method of operation is explained.

Distribution of Sea Water in the Charles River Basin After excluding Tidal Waters.—By M. F. Sanborn. Eng. News, March 10, 1910, 2 pp.

Presents diagrams, tables and descriptive matter showing rate of freshening of the water in the Charles River Basin after excluding tidal waters. Studies were also made to determine the vertical circulation caused by wind and rains and the interchange of fresh and salt water brought about by the operation of the lock.

Special Type of Head Gate for Irrigation Canals.—Eng. Rec., March 12, 1910, ⅔ pp.

Illustrates and describes briefly a reinforced concrete head gate structure, designed to do away with scour in soft channels. A suggestive article for irrigation engineers.

RAILWAYS.

Construction of the Western Pacific Ry.—Ry. & Eng. Rev., March 12, 1910, 2 pp., ill.

An excellent description of the building of a western railway. Maps and profiles are presented together with 77 reproductions of photographs and working drawings of structures.

Forestry Work of the A., T. & S. F. Ry.—Ry. & Eng. Rev., March 12, 1910, 4 pp., ill.

A very good article on the cultivation of the eucalyptus, a fast growing timber tree of great value.

Reinforcement of Conduit Rails at Washington, D. C.—By Philander Betts. El. Ry. Jl., March 12, 1910, 2½ pp., ill.

In Washington the electric roads have an un-

Railroad Construction

Theory and Practice. A Text-book for the Use of Students in Colleges and Technical Schools.

By WALTER LORING WEBB, C. E.

Fourth Edition, Revised and Enlarged. 16mo, xvii + 777 pages. 217 figures, 10 plates. Morocco, $5.00.

Buildings and Structures of American Railroads

A Reference Book for Railroad Managers, Superintendents, Master Mechanics, Engineers, Architects and Students.

By the Late WALTER G. BERG, C. E.

4to, xxxiv + 500 pages and over 700 illustrations. Cloth $5.00.

Tables of Quantities for Preliminary Estimates

By E. F. HAUCH and P. D. RICE

16mo, iii + 92 pages. Cloth, $1.25 net.

Field Manual for Railroad Engineers

By J. C. NAGLE

Second Edition, Revised. 16mo, xv + 403 pages, 99 figures. Morocco, $3.00.

Railroad Engineering

By WILLIAM G. RAYMOND

Vol. 2. Elements of Railroad Engineering

8vo, xvi + 405 pages. 107 figures, 18 plates. Cloth, $3.50.

JOHN WILEY & SONS

43 and 45 East 19th Street
NEW YORK CITY

London: CHAPMAN & HALL, Ltd. Montreal, Can.: RENOUF PUB. CO.

Tables for Calculating Sizes of Steam Pipes

By ISAAC CHAIMOVITSCH, M. E.

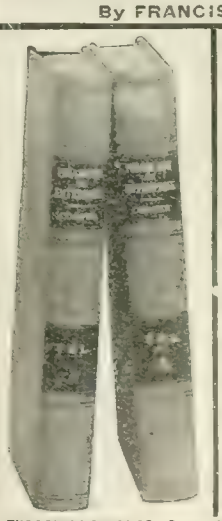
These tables furnish a method of determining sizes of steam pipes for low pressure heating without laborious mathematical calculations.

Bound in Cloth; 4½x6¾ in.; 47 pp. Postpaid, $2.00.

2134 Haddon Avenue CHICAGO

FINANCING AN ENTERPRISE

By FRANCIS COOPER



TWO volumes that have helped hundreds of men win fortunes by showing them how to successfully finance and promote their business or their discoveries. Highly endorsed. Only successful work on promotion.

VOL. 1 describes conditions necessary for successful financing; how to investigate, protect and capitalize an enterprise; experimental work and model issues.

VOL. 2 tells best methods for securing money, privately, or publicly, by advertising; how to advertise; how to write a winning prospectus. Important clauses in stock, bonds, incorporation, etc., etc. Invaluable knowledge gathered from fifteen years' experience. Save you hundred times its cost. Full descriptive circular if you want it.

Two vols., $5.00. Buckram binding, 2 vols., $7.00 prepaid. Either vol. separately, $3.00 prepaid.

THE RONALD PRESS CO., Rooms 30-36, 229 Broadway, New York

derground power conduit, thus eliminating overhead trolley wires and poles to carry them. Yokes to carry the rails are placed 5 ft. apart, but the track sagged. This article describes methods and costs of placing reinforced concrete longitudinal girders under each rail bearing on the yokes, thus giving a rigid track.

Cost Iron and Steel Car Wheels.—El. Ry. Jl., March 12, 1910. 3 pp., ill.

A number of questions had been asked in Hartford shops of the Connecticut Company about car wheels. Mr. Beebe of the Griffen Wheel Co. went down on invitation and answered all the questions, this article containing the questions and answers.

The Hudson Bay Railway.—Eng. Rec., March 12, 1910, 1⅔ pp.; Eng. News, March 2, 1910, 1⅓ pp.

Summarizes the results of the surveys made for the proposed railway line to Hudson Bay at Ft. Churchill. Gives outline of character of country passed through and its natural resources, and describes physical characteristics of possible line with estimates of cost and other data. The report shows that the average open season of Hudson Bay at Ft. Churchill is 5 months.

Empaline Shops, Southern Pacific Railroad of Mexico.—Eng. Rec., March 12, 1910, 2 pp.

Shows lay-out plan of shop plant and gives a general description of the main structural features. Of value chiefly as showing plant lay-outs.

Oak Point Flout Bridges on the East River.—Eng. Rec., March 12, 1910, 3⅔ pp.

General description with essential plans of bridges for transferring railway cars from land to car flounts. The plant is notable for its size and for its mechanical completeness.

Unit Movements at Terminal Stations.—By H. Niel Harding. Eng. Rec., March 12, 1910, 2⅓ pp.

Presents as a basis for figuring the expense of handling freight at railway terminals, the product of the number of unit movements and the average load moved. Presents duties from actual records as to number of unit movements per hour and minute and average loads. Illustrates the use of these data in reducing expenses and increasing capacity. An unusually suggestive article.

Cost of Electric Operation of Steam Railways.—Eng. News, March 31, 1910, 2⅓ pp.

Discusses design of electriclocomotion, first cost of electrification, cost of operation, cost compared with steam, etc. A notably interesting paper.

New Subway Line for New York City; Its History.—Eng. News, March 10, 1910, 2 pp.

Gives map of original rapid transit subway, including extension to Brooklyn, of later Fourth Ave. subway line in Brooklyn, and of new triborough subway line now planned for construction. A historical outline of the development of these lines is given and the legal and other conditions affecting the construction, financing and operation of the new lines are described.

Economical Freight Transference at Railway Terminals and Shipping Docks.—By H. Neil. Harding. Eng. News, March 3, 1910, 5¾ pp.

Gives a number of costs of handling freight at terminals, points excessive proportions of terminal costs, describes present methods of freight handling and gives principles that must govern any mechanical arrangement for freight handling. Describes a "transpherage" on "space covering" system of overhead telpher lines, with diagrams showing range of application, etc. A notably suggestive article.

Protection of Cross-Ties From Mechanical Wear by Means of Plugs, Screw Spikes and Tie Plates, with Estimates of Costs and Savings.—Eng.-Contg., March 30, 1910, 1¾ pp.

This article endeavors to demonstrate by means of estimates and actual cost figures the saving which can be made by protecting cross-ties from mechanical wear by using plugs, screw spikes and tie plates. It is an unusually suggestive article to railway maintenance of way engineers.

Some Notes on Cost of Treating Ties with Preservatives.—Eng.-Contg., March 16, 1910, ¾ p.

A valuable article on the costs and economics of treating railway ties. A comparison is made between the cost of treating seasoned and unseasoned ties. Costs of treatment and returns on investment are discussed.

NEARLY READY

Second Edition

of

Gillette's "COST DATA"

(1,900 Pages)

THE second edition of Gillette's "Handbook of Cost Data" is now being printed, and should be ready for distribution about the middle of April. *It contains more than 4 1-2 times as much matter as the first edition.*

Each page of the second edition is equivalent to 1 1-2 pages of the first edition, so that the 1,900 pages of this edition would make 2,700 pages of the same size of type as the first edition. In spite of the great size of the book its price is only

$5.00 net, postpaid.

The book is bound in leather, and in other respects resembles the first edition.

BRIDGES, BUILDINGS AND FOUNDATIONS.

New Formulas for Base and Bearing Plates.—Eng.-Contg., March 16, 1910, 1¼ pp.

This article summarizes the formulas developed as a result of a series of experiments made at the University of Illinois. The article is a valuable one to structural and bridge engineers.

Specifications for Erection of Railroad Bridges.—Eng.-Contg., March 30, 1910, 2¼ pp.

A paper discussing the consideration which should be taken into account in preparing specifications for the erection of steel railroad bridges. A sample specification is included in the article.

Inside Glazed Greenhouses in the Berlin Botanical Gardens.—Eng. News, March 17, 1910, 2 pp.

Shows general plans of framework, including arched roof of 100 ft. span and 77 ft. rise for tropical building, describes general construction and illustrates and describes construction of inside glazing adopted to keep the steelwork from the moist inside air and render it more accessible for painting and repair.

Steelwork of the Bryant Building, New York.—Eng. Rec., March 26, 1910, 2⅔ pp.

Shows foundation plan, grillages and typical roof, columns and wall girders, details of structural steel frames for a 30-story building. The description is of the structural features alone.

Cantilever Construction and Wind Bracing Details in the People's Gas, Light & Coke Co. Building, Chicago.—Eng. News, March 10, 1910, 1½ pp.

This 21-story office building has its walls in two points supported above the third story carried on cantilever of 4 ft. 5 ins. projection; the supporting wall columns of the three lower stories are set back this distance to permit placing along the fronts a row of monolithic granite columns. Drawings and description of the cantilever construction are given and also details and description of the system of wind bracing adopted.

Steelwork in the New York Municipal Building.—Eng. Rec., March 19, 1910, 4⅓ pp.

Describes the general structural features of the steel framework for this 25-story building and for the 15 additional stories of tower. Plans are shown of typical column and beam lay-outs at various heights and details are shown of wall supports, column pedestals and footings and similar details. The treatment is purely descriptive.

Shepardstown Viaduct, Norfolk & Western Railway.—Eng. Rec., March 19, 1910, 2 pp.

The bridge is a combined steel tower viaduct and riveted truss bridge on masonry piers, having a total length of 1,438 ft. and a greatest height of 120 ft. General details are shown of the tower buts, plate girders for viaduct and the truss spans. The description is of the structural features alone.

New Plant of the Carters Ink Co.—Eng. Rec., March 19, 1910, 2 pp.

Shows block plan and floor plans of four-story L-shaped factory building, with a general description of the reinforced concrete structural features.

Reinforced Concrete Machinery Warehouse.—By H. M. Boyajohn. Eng. Rec., March 12, 1910, 1⅔ pp.

The warehouse is 100x400 ft., with a contral bay 50 ft. wide open to the roof and two side bays with galleries. The interesting details are the reinforced concrete columns, crane girders and gallery floors. Detail drawings of these are given.

Reconstruction of the Boyleston Street Bridge at Boston.—Eng. Rec., March 5, 1910, 4½ pp.

Describes in detail the structural features of the reconstruction work required to strengthen a 216-ft., pin connected skew span to carry heavy street railway traffic. Drawings of the various structural features are given.

CONCRETE AND REINFORCED CONCRETE.

Some Methods and Costs of Building Reinforced Concrete Cisterns.—Eng.-Contg., March 30, 1910, 1¾ pp.

This is an unusual article because of the cost data which is given on reinforced concrete tank construction. Five different tanks are described and the complete itemized cost of each is given.

Construction and Cost of an Inexpensive Steam Curing Oven for Concrete Block Plants, with Some Notes on Operation.—Eng.-Contg., March 30, 1910, 1⅓ pp.

This article describes the construction of a small curing oven, discusses the best methods to be followed in curing concrete blocks, and gives many figures of costs of oven construction and of operation.

A Method of Depositing Concrete by Chutes in Building Construction, with Costs of Actual Work.—Eng.-Contg., March 30, 1910, 1¾ pp.

Describes and illustrates a method of depositing concrete through chutes for building construction. The practice adopted in constructing a number of buildings is described and general figures of costs are given. An article of much interest to concrete building contractors.

Cost of Constructing a Reinforced Concrete Fence Around a Shaft Top.—Eng.-Contg., March 30, 1910, 1⅓ pp.

This is a very interesting article describing the method of constructing a reinforced concrete fence around the edge of a shaft top. The method of handling the forms is of particular interest. Unit costs of the work are given.

A Simple Method of Computing the Strength of Flat Reinforced Concrete Plates.—Eng.-Contg., March 23, 1910, 4¾ pp.; Eng. News, March 31, 1910, 3¼ pp.

This is a comprehensive investigation of the subject of methods of computation of flat reinforced concrete plates. The discussion is largely mathematical and chiefly of interest to designing engineers.

Method of Constructing Concrete Lining for Bergen Hill Tunnels; Pennsylvania R. R. Tunnel Extension to New York City.—Eng.-Contg., March 16, 1910, 8⅓ pp.

This is a very complete description of the methods employed and plan used in lining a twin tube railway tunnel with concrete. The work called for the laying of electrical conduits and for complete water-proofing. These features are described in detail. A table is also given showing the labor force employed, the rates of wages paid and the total daily labor expense.

Results of Tests of Model Concrete Arches Made in Connection with the Design of the Medina Aqueduct, New York Barge Canal.—Eng.-Contg., March 16, 1910, 3¾ pp.; Eng. News, March 10, 1910, 3¼ pp.

The tests were made on a series of model arches. The testing apparatus is described, tables are given of the loads which the arches supported and diagrams and figures are presented showing the methods of failure.

A Comparison of the Efficiency and Economy of Different Designs of Reinforced Concrete Columns.—Eng.-Contg., March 9, 1910, 3½ pp.; Cement, March, 1910, 13 pp.

An unusually valuable article on concrete columns. It gives the results of a series of tests tending to show the comparative economy of concrete, reinforced concrete and structural columns. The data given will be found of special value to the designing engineers.

Methods and Costs of Sinking the Brier Hill Concrete-Lined Shaft, Michigan.—Eng.-Contg., March 2, 1910, 1¾ pp.

Describes the method of sinking and lining a circular shaft with concrete. Drawings are shown of the concrete plant and the forms used and the itemized cost of the lining is given.

A Method of Heating Broken Stone in Wagons for Concrete Work.—Eng.-Contg., March 2, 1910, ⅓ p.

This article describes a simple method adopted for heating broken stone in wagons. A grid of steam pipes was lowered on top of the load and live steam turned on.

A Method of Long Span, Light Floor, Reinforced Concrete Construction, with Comparative Costs.—Eng.-Contg., March 2, 1910, 1 p.

This article shows drawings for a 53-ft. reinforced concrete girder. It also makes some comparisons of cost between this girder construction and fireproof steel construction.

Method and Cost of Constructing a Concrete Block Warehouse.—Eng.-Contg., March 2, 1910, 1¼ pp.; Eng. News, March 10, 1910, ½ p.

This article describes the methods employed in constructing a one-story warehouse of concrete blocks and gives itemized cost of manu-

A Book of Instructions For Reinforced Concrete Inspectors

INSPECTORS' HANDBOOK OF REINFORCED CONCRETE

BY

W. E. BALLINGER and EMILE G. PERROT

This book was written for the purpose of assisting inspectors in carrying out plans and specifications under which they are working. It points out the essentials governing the construction of reinforced concrete buildings and is divided into three general divisions, each division embracing a study of one of the main elements that enter into the construction of this class of buildings. These are, first, the "Forms or Falsework," second, the "Reinforcement" and third, the "Concrete."

Flexible cloth; 4½x6½ in.; 64 pp.; 6 Folding Plates, and an Appendix of Formulas and Tables. Price, $1.00 net.

CONCRETE-STEEL CONSTRUCTION

(Der Eisenbetonbau)

BY

PROF. EMIL MÖRSCH

of the Zurich Polytechnic

Authorized Translation of the Third (1908) Edition

By E. P. GOODRICH, C. E.

Mörsch's "Eisenbetonbau" is the clearest exposition of European methods of Reinforced Concrete Construction that has yet been published and is a recognized standard in Europe. It also has had an extensive sale in this country, but the comparatively limited usefulness of the German edition has prompted its translation and publication in English. It contains much information not given in any other book in the English language, and we highly recommend it as a necessary work for every engineer dealing with reinforced concrete design and construction.

Cloth; 6½ x 9½ inches; 364 pages and 350 illustrations. Price, $5.00 net.

ORDER NOW.

ENGINEERING NEWS BOOK DEPARTMENT
220 Broadway New York.

facturing the blocks and placing them in the walls of the building.

Comments on Contracting for Concrete Bridges with Description of a Form of Cost Recording.—Eng.-Contg., March 2, 1910, 1⅓ pp.

Describes a cost-keeping system intended for reinforced concrete bridge work. Illustration of blanks used are given and the method of collecting and recording the costs is described.

Method of Laying Concrete Under Water, Using a Tremie; Detroit River Tunnel.—Eng.-Contg., March 2, 1910, 2 pp.; Eng. News, March 17, 1910, 3 pp.; Cement, March 1910, 7 pp.

A general descriptive article relating to the methods adopted for placing concrete under water in constructing the Detroit River Tunnels of the Michigan Central R. R. The concrete was deposited by means of tremies, and a full description of the concreting plant and the methods and results of the work is given.

Representative Concrete Structures on the New York Barge Canal and Methods of Inspecting, Mixing and Handling Concrete.—Eng.-Contg., March 30, 1910, 2⅔ pp.

A general descriptive article relating to the various classes of concrete work being done on the New York Barge Canal. Representative structures are described and the methods of inspecting materials and mixing and placing concrete are outlined. Some of the plants illustrated are of unusual size and are novel in design.

Short Span, Single Track Concrete Arch Bridges.—Eng. Rec., March 19, 1910, 1⅓ pp.

Shows details of two reinforced concrete arches under embankment, describes structural feaures and gives itemized costs.

Twelve-Story Reinforced Concrete Building Without Interior Columns.—Eng. Rec., March 5, 1910, 1¼ pp.

The building described is 110½x48 ft. Details of the reinforced concrete framing are described and illustrated.

Standard Building Regulations for the Use of Reinforced Concrete.—Eng. Rec., March 5, 1910, 2¼ pp.

A reprint of the building regulations submitted by the National Association of Cement Users to little ballot for adoption as a standard of the association.

Further Tests on Effect of Electrolysis on Concrete.—By O. L. Etinge. Eng. News, March 31, 1910, 2 pp.

Describes methods and gives results of tests of effect of electrolysis on concrete blocks and briquettes. Conclusion is that direct damage of electricity is practically nothing.

Reinforced Concrete Arch Highway Bridge in Indiana Wrecked by Erosion of Foundations.—Eng. News, March 17, 1910, 1¾ pp.

Shows details of bridge as built and sketches and photographs of failure and describes construction and conditions found by study of wreck. Failure determined to be due to undermining of one of the piers by flood.

Reinforcing Compression Members of Concrete in a Plain Transverse to the Line of Thrust.—By R. A. Cummings. Eng. News, March 17, 1910, ⅔ p.

Gives results of a series of tests made on short reinforced columns reinforced in transverse plans with flat plates or wires or bands. Some interesting results are obtained.

EARTH AND ROCK EXCAVATION.

Some Records of Work with a Scraper Bucket Excavator on the New York Barge Canal.—Eng.-Contg., March 23, 1910, 1 p.

Describes work in excavating a canal section with a scraper bucket excavator. Complete record of 21 days' operation of the excavator are given, with a statement of the number of men employed in the work. An interesting article to earthwork contractors.

Method of Trenching for a Sewer at Auburn, N. Y., Using a Revolving Steam Shovel.—Eng.-Contg., March 2, 1910, ¾ p.

A brief article describing the method of constructing some 13 miles of sewer trench using a revolving steam shovel. The method of operating the shovel, the force required and the progress of work are stated.

Method of Making a 14,280-Cu. Yd. Blast in Basalt Rock, with Some Data on Costs.—Eng.-Contg., March 2, 1910, ⅔ p.

Illustrates plan of the tunnels and describes

The Whole Field Of

CONCRETE AND REINFORCED CONCRETE

DESIGN—CONSTRUCTION—INSPECTION

is covered by the books briefly described below:

Concrete and Reinforced Concrete Construction

By HOMER A. REID

The best, most complete and comprehensive book covering both the theory of concrete design and the practice of concrete construction.

Cloth, 6½x9 inches—906 pages. **Price, $5.00 net, postpaid.**

Engineers' Pocketbook of Reinforced Concrete

By E. LEE HEIDENREICH

A book written by an experienced designer and specially fitted for the use of engineers engaged in designing concrete structures.

Leather, 4½x6¾ inches—374 pages. **Price, $3.00 net, postpaid.**

Theory and Design of Reinforced Concrete Arches

By ARVID REUTERDAHL

Presenting the theory in perfectly complete form, requiring no reference to other books in so far as arch design is concerned.

Cloth, 6x9 inches—132 pages. **Price, $2.00 net, postpaid.**

Diagrams for Designing Reinforced Concrete Structures

By G. F. DODGE

The diagrams, plotted on logarithmic paper, are so devised that results may be read direct for all conditions occurring in ordinary practice.

Half cloth, 12x15 inches—112 pages. **Price, $4.00 net, postpaid.**

Reinforced Concrete—A Manual of Practice

By ERNEST McCULLOUGH

Presents the subject of design in the simplest possible manner and sets forth lucidly the principles of safe and good construction.

Cloth, 5x8 inches—128 pages. **Price, $1.50 net, postpaid.**

Concrete Bridges and Culverts

By H. G. TYRRELL

A useful book for the engineer, presenting formulas without taking up their mathematical derivation and giving tables of dimensions and quantities and estimates of cost.

Flexible leather—272 pages. **Price, $3.00 net, postpaid.**

Concrete Construction—Methods and Cost

By H. P. GILLETTE and C. S. HILL

Devoted exclusively to the methods and cost of concrete and reinforced concrete construction and intended for engineers and contractors engaged in such construction and for designers who are seeking for the data upon which to insure economy in their designs.

Cloth, 6x9 inches—700 pages. **Price, $5.00 net, postpaid.**

Concrete Inspection

By C. S. HILL

A manual of information and instructions for inspectors of concrete work.

Cloth, 3½x6 inches—186 pages. **Price, $1.00 net, postpaid.**

Practical Cement Testing

By W. PURVES TAYLOR

Written by a practical cement tester and the first exhaustive treatise on this important subject.

Cloth, 6x9 inches—330 pages. **Price, $3.00 net, postpaid.**

Cements, Mortars and Concretes

By MYRON S. FALK

A complete report of the results of tests made during the past fifteen years

Cloth, 6x9 inches—184 pages. **Price, $2.50 net, postpaid.**

Send for 32-page booklet—listing the above books in detail.

You can secure one year's domestic subscription to ENGINEERING-CONTRACTING for $1.50 when this amount is added to the price of any one of the above books.

The Myron C. Clark Publishing Co.

Publication Office,
355 Dearborn St., Chicago

Eastern Office:
13-21 Park Row, New York

the method of loading a blasting charge of some 3,500 lbs. of powder.

Method of Making a Steam Shovel Cut of Two Lifts in One Lift.—Eng.-Contg., March 2, 1910, ½ p.

Describes briefly the arrangement of tracks and shovels for excavating a cut in one lift which would normally have been excavated in two lifts.

Methods of Open Cut Rock Excavation at the Pennsylvania R. R. Terminal Station at New York, with Some Data on Drill Reformance.—Eng.-Contg., March 16, 1910, 2⅓ pp.

Describes in a general way the methods adopted in excavating some 521,000 cu. yds. of rock and earth for the foundations of the Pennsylvania R. R. Terminal Station at New York City. A special feature of the work was excavating under the structure of an elevated railway without disturbing traffic. diagrams are given showing the sequence of operations by which this task was performed.

Methods and Cost of Excavating Twin Tunnels Through Trap Rock for the Pennsylvania R. R. Tunnel Entrance to New York City.—Eng.-Contg., March 9, 1910, 6½ pp.

This is one of the most valuable articles on tunnel excavation that has been published for a long time. It gives very complete records of drilling and mucking work and also gives costs which will be found unusually valuable to tunnel men.

Shapes of Drill Bits in Use, with Comments on Efficiency and on Sharpening and Tempering.—Eng.-Contg., March 23, 1910, 1½ pp.

This article is interesting as showing by diagrams the various shapes of drill bits used in rock excavation and mining work in America and Europe. The characteristics of the several shapes of bits are discussed and the advantages and disadvantages of each shape are stated. The article concludes with some instructive suggestions on the best methods of sharpening and tempering drill bits.

Heavy Regrading by Means of Hydraulic Sliming, at Seattle, Wash.—By G. H. Moore. Eng. News, March 31, 1910, 3¼ pp.

Describes plant and methods of operation employed in reducing the grade of Denny Hill, comprising 46 city blocks by hydraulic sliming. Maps and profiles of the work and views of plant are given. The methods of operation are described. A general descriptive article.

Dredging Nome Beach Sands.—Min. & Min., March, 1910, 2 pp., ill.

Describes a form of dredge used in Alaska to mine the gold found in the sand and gravel on the beaches near Nome. Dipper and bucket dredges have been found to be unsatisfactory in mining under water where there is tidal action, so caissons are employed.

A Self-Dumping Barge.—By A. F. Wiking. Eng. News, March 10, 1910, 1 p.

Describes a barge the weight distribution of which can be so changed by means of air and water tanks that it can be tilted, dumped and righted by mechanical means.

Instrument for measuring and Recording Tunnel Sections.—Eng. News, March 3, 1910, ¾ p.

Illustrates and describes an instrument for recording graphically exact cross-sectional outline of a tunnel excavation. This outline is recorded to scale over a scale drawing of the planned tunnel section.

MISCELLANEOUS.

Strength of Treated Timber.—Eng. News, March 24, 1910, ½ p.

Conclusions from various tests of treated timber showing generally that treated timber is weakened by high steam preservers and heavy impregnation and is little affected by light impregnation.

Methods of Filing and Indexing Drawings and Photographs, Board of Water Supply, New York City.—Eng.-Contg., March 2, 1910, 1½ pp.

Describes in detail a filing system which has been used with success for a large organization.

History of the Ordnance Survey.—By J. J. Amos. Surveyor, March 25, 1910, 4½ pp.

An interesting article containing much information on the history of the English ordnance survey and on the methods of making it. A specially valuable part of the article is the description of the preparation of the ordnance maps.

Do You Want To Know?

"SCAMPING TRICKS"

By John Newman

A well-known civil engineer, describes, in an amusing way, some of the methods that are frequently employed to execute work cheaply and quickly. This book is an **eye=opener** in more ways than one.

A new edition is now ready and we have secured a limited number that we offer at **$1.00 per copy, postpaid.**

Send your dollar NOW while we can fill your order.

SPON & CHAMBERLAIN

123 E. C. Liberty Street **NEW YORK**

Housing of Town Planning.—By C. J. Yorath. Surveyor, March 4 and 11, 1910, 4 pp.

In this article the author considers the question of the better housing of the working classes, under three heads: (1) How to deal with unhealthy and conjested areas; (2) how to improve dilapidated property, and (3) how to provide proper accommodation for the working classes. The fundamental points to be taken into consideration in making a town plan are also given.

Reasonable Rates for Gas and Electricity as Determined by the Wisconsin Railroad Commission for the City of Madison.—Eng. News, March 31, 1910, 2⅓ pp.

Subject discussed under the headings of method of valuation, reasonable return, depreciation and rates and service. A valuable article.

Town Scavenging and Refuse Disposal.—By Hugh S. Watson. Mun. Eng. Mag., April, 1910, 4 pp.

General description of English methods of disposing of house refuse by filling low lands, by discharging into the sea, by separating crude refuse by hand or machinery, by pulverizing the crude refuse by machinery, and by burning at a refuse destructor.

Subaqueous Tunnels.—By R. B. Woodworth. Ry. Age. Gaz., March 11, 1910, 3¾ pp., ill. Part I.

This is an installment article of a paper read before the Railway Club of Pittsburg. It is a very good paper on the subject.

Fundamental Principles of Efficiency.—Ry. & Eng. Rev., March 5, 1910, 1½ pp.

Extracts from a paper by Mr. Harrington Emerson before the Railway Club of Pittsburg, Feb. 25, 1910. Efficiency is reduced to eight principles: 1, common sense; 2, discipline; 3, fair deal; 4, adequate and reliable records; 5, standardized conditions; 6, standardized operation; 7, compensation on the basis of efficiency; 8, staff men in charge of efficiency work.

High Temperature Garbage and Refuse Destructors.—By W. F. Morse. Mun. Eng. Mag., April, 1910, 4 pp.

A reprint of a paper read before an American Society of Municipal Superintendents. In it the author draws a comparison of the crematory system and the destructor system and points out the advantages of the latter. Some figures are given on the cost of installing and operating a destructor plant in a city of 100,000 population.

The Journal OF Western Society OF Engineers

is a high grade bi-monthly illustrated magazine of about one hundred pages in each number, and contains the original papers of engineering interest that have been presented to the society, with the discussion of the same. These papers treat of subjects in all lines of engineering, are well illustrated and should be of value to engineers, chemists, scientific and business men everywhere.

The Subscription Price is $3.00 a Year

The circulation is about 1,600 copies of each issue, six times a year.

The JOURNAL is a valuable advertising medium, as it goes all over the world and to a high class of technical readers. Advertisements, if of interest to engineers, may be published in the JOURNAL.

For rates or other information concerning the JOURNAL of the Western Society of Engineers address or call upon the Secretary, **1735 Monadnock Block, Chicago.**

The Relation of the Steam Turbine to the Modern Central Station Practice—With Discussion.
By G R. PARKER, Engineers' Club of St. Louis.

Asphaltic Oil Treatment of Macadam Roads
By CHARLES H. BARTLETT, Engineers' Society of Milwaukee.

Sun River Project, Montana, U. S. Reclamation Service.
By S. B. ROBBINS, Montana Society of Engineers.

Annual Address
J. T. EASTWOOD, Louisiana Engineering Society.

Journal of the Association of Engineering Societies, February, 1910

facturing the blocks and placing them in the walls of the building.

Comments on Contracting for Concrete Bridges with Description of a Form of Cost Recording.—Eng.-Contg., March 2, 1910, 1⅓ pp.

Describes a cost-keeping system intended for reinforced concrete bridge work. Illustration of blanks used are given and the method of collecting and recording the costs is described.

Method of Laying Concrete Under Water, Using a Tremie; Detroit River Tunnel.—Eng.-Contg., March 2, 1910, 2 pp.; Eng. News, March 17, 1910, 3 pp.; Cement, March 1910, 7 pp.

A general descriptive article relating to the methods adopted for placing concrete under water in constructing the Detroit River Tunnels of the Michigan Central R. R. The concrete was deposited by means of tremies, and a full description of the concreting plant and the methods and results of the work is given.

Representative Concrete Structures on the New York Barge Canal and Methods of Inspecting, Mixing and Handling Concrete.—Eng.-Contg., March 30, 1910, 2⅔ pp.

A general descriptive article relating to the various classes of concrete work being done on the New York Barge Canal. Representative structures are described and the methods of inspecting materials and mixing and placing concrete are outlined. Some of the plants illustrated are of unusual size and are novel in design.

Short Span, Single Track Concrete Arch Bridges.—Eng. Rec., March 19, 1910, 1⅓ pp.

Shows details of two reinforced concrete arches under embankment, describes structural feaures and gives itemized costs.

Twelve-Story Reinforced Concrete Building Without Interior Columns.—Eng. Rec., March 5, 1910, 1¼ pp.

The building described is 110½x48 ft. Details of the reinforced concrete framing are described and illustrated.

Standard Building Regulations for the Use of Reinforced Concrete.—Eng. Rec., March 5, 1910, 2¼ pp.

A reprint of the building regulations submitted by the National Association of Cement Users to little ballot for adoption as a standard of the association.

Further Tests on Effect of Electrolysis on Concrete.—By O. L. Etinge. Eng. News, March 31, 1910, 2 pp.

Describes methods and gives results of tests of effect of electrolysis on concrete blocks and briquettes. Conclusion is that direct damage of electricity is practically nothing.

Reinforced Concrete Arch Highway Bridge in Indiana Wrecked by Erosion of Foundations.—Eng. News, March 17, 1910, 1¾ pp.

Shows details of bridge as built and sketches and photographs of failure and describes construction and conditions found by study of wreck. Failure determined to be due to undermining of one of the piers by flood.

Reinforcing Compression Members of Concrete In a Plain Transverse to the Line of Thrust.—By R. A. Cummings. Eng. News, March 17, 1910, ⅔ p.

Gives results of a series of tests made on short reinforced columns reinforced in transverse plans with flat plates or wires or bands. Some interesting results are obtained.

EARTH AND ROCK EXCAVATION.

Some Records of Work with a Scraper Bucket Excavator on the New York Barge Canal.—Eng.-Contg., March 23, 1910, 1 p.

Describes work in excavating a canal section with a scraper bucket excavator. Complete record of 21 days' operation of the excavator are given, with a statement of the number of men employed in the work. An interesting article to earthwork contractors.

Method of Trenching for a Sewer at Auburn, N. Y., Using a Revolving Steam Shovel.—Eng.-Contg., March 2, 1910, ⅔ p.

A brief article describing the method of constructing some 13 miles of sewer trench using a revolving steam shovel. The method of operating the shovel, the force required and the progress of work are stated.

Method of Making a 14,280-Cu. Yd. Blast in Basalt Rock, with Some Data on Costs.—Eng.-Contg., March 2, 1910, ⅔ p.

Illustrates plan of the tunnels and describes

The Whole Field Of

CONCRETE AND REINFORCED CONCRETE

DESIGN—CONSTRUCTION—INSPECTION

is covered by the books briefly described below:

Concrete and Reinforced Concrete Construction

By HOMER A. REID

The best, most complete and comprehensive book covering both the theory of concrete design and the practice of concrete construction.

Cloth, 6½x9 inches—906 pages. **Price, $5.00 net, postpaid.**

Engineers' Pocketbook of Reinforced Concrete

By E. LEE HEIDENREICH

A book written by an experienced designer and specially fitted for the use of engineers engaged in designing concrete structures.

Leather, 4½x6¾ inches—374 pages. **Price, $3.00 net, postpaid.**

Theory and Design of Reinforced Concrete Arches

By ARVID REUTERDAHL

Presenting the theory in perfectly complete form, requiring no reference to other books in so far as arch design is concerned.

Cloth, 6x9 inches—132 pages. **Price, $2.00 net, postpaid.**

Diagrams for Designing Reinforced Concrete Structures

By G. F. DODGE

The diagrams, plotted on logarithmic paper, are so devised that results may be read direct for all conditions occurring in ordinary practice.

Half cloth, 12x15 inches—112 pages. **Price, $4.00 net, postpaid.**

Reinforced Concrete—A Manual of Practice

By ERNEST McCULLOUGH

Presents the subject of design in the simplest possible manner and sets forth lucidly the principles of safe and good construction.

Cloth, 5x8 inches—128 pages. **Price, $1.50 net, postpaid.**

Concrete Bridges and Culverts

By H. G. TYRRELL

A useful book for the engineer, presenting formulas without taking up their mathematical derivation and giving tables of dimensions and quantities and estimates of cost.

Flexible leather—272 pages. **Price, $3.00 net, postpaid.**

Concrete Construction—Methods and Cost

By H. P. GILLETTE and C. S. HILL

Devoted exclusively to the methods and cost of concrete and reinforced concrete construction and intended for engineers and contractors engaged in such construction and for designers who are seeking for the data upon which to insure economy in their designs.

Cloth, 6x9 inches—700 pages. **Price, $5.00 net, postpaid.**

Concrete Inspection

By C. S. HILL

A manual of information and instructions for inspectors of concrete work.

Cloth, 3½x6 inches—186 pages. **Price, $1.00 net, postpaid.**

Practical Cement Testing

By W. PURVES TAYLOR

Written by a practical cement tester and the first exhaustive treatise on this important subject.

Cloth, 6x9 inches—330 pages. **Price, $3.00 net, postpaid.**

Cements, Mortars and Concretes

By MYRON S. FALK

A complete report of the results of tests made during the past fifteen years

Cloth, 6x9 inches—184 pages. **Price, $2.50 net, postpaid.**

Send for 32-page booklet—listing the above books in detail.

You can secure one year's domestic subscription to ENGINEERING-CONTRACTING for $1.50 when this amount is added to the price of any one of the above books.

The Myron C. Clark Publishing Co.

Eastern Office: 13-21 Park Row, New York

the method of loading a blasting charge of some 3,500 lbs. of powder.

Method of Making a Steam Shovel Cut of Two Lifts in One Lift.—Eng.-Contg., March 2, 1910, ½ p.

Describes briefly the arrangement of tracks and shovels for excavating a cut in one lift which would normally have been excavated in two lifts.

Methods of Open Cut Rock Excavation at the Pennsylvania R. R. Terminal Station at New York, with Some Data on Drill Reformance.—Eng.-Contg.. March 16, 1910, 2⅓ pp.

Describes in a general way the methods adopted in excavating some 521,000 cu. yds. of rock and earth for the foundations of the Pennsylvania R. R. Terminal Station at New York City. A special feature of the work was excavating under the structure of an elevated railway without disturbing traffic. diagrams are given showing the sequence of operations by which this task was performed.

Methods and Cost of Excavating Twin Tunnels Through Trap Rock for the Pennsylvania R. R. Tunnel Entrance to New York City.—Eng.-Contg., March 9, 1910, 6½ pp.

This is one of the most valuable articles on tunnel excavation that has been published for a long time. It gives very complete records of drilling and mucking work and also gives costs which will be found unusually valuable to tunnel men.

Shapes of Drill Bits in Use, with Comments on Efficiency and on Sharpening and Tempering.—Eng.-Contg., March 23, 1910, 1½ pp.

This article is interesting as showing by diagrams the various shapes of drill bits used in rock excavation and mining work in America and Europe. The characteristics of the several shapes of bits are discussed and the advantages and disadvantages of each shape are stated. The article concludes with some instructive suggestions on the best methods of sharpening and tempering drill bits.

Heavy Regrading by Means of Hydraulic Sliming, at Seattle, Wash.—By G. H. Moore. Eng. News, March 31, 1910, 3¼ pp.

Describes plant and methods of operation employed in reducing the grade of Denny Hill, comprising 46 city blocks by hydraulic sliming. Maps and profiles of the work and views of plant are given. The methods of operation are described. A general descriptive article.

Dredging Nome Beach Sands.—Min. & Min., March, 1910, 2 pp., ill.

Describes a form of dredge used in Alaska to mine the gold found in the sand and gravel on the beaches near Nome. Dipper and bucket dredges have been found to be unsatisfactory in mining under water where there is tidal action, so caissons are employed.

A Self-Dumping Barge.—By A. F. Wiking. Eng. News, March 10, 1910, 1 p.

Describes a barge the weight distribution of which can be so changed by means of air and water tanks that it can be tilted, dumped and righted by mechanical means.

Instrument for measuring and Recording Tunnel Sections.—Eng. News, March 3, 1910, ¾ p.

Illustrates and describes an instrument for recording graphically exact cross-sectional outline of a tunnel excavation. This outline is recorded to scale over a scale drawing of the planned tunnel section.

MISCELLANEOUS.

Strength of Treated Timber.—Eng. News, March 24, 1910, ½ p.

Conclusions from various tests of treated timber showing generally that treated timber is weakened by high steam preservers and heavy impregnation and is little affected by light impregnation.

Methods of Filing and Indexing Drawings and Photographs, Board of Water Supply, New York City.—Eng.-Contg., March 2, 1910, 1½ pp.

Describes in detail a filing system which has been used with success for a large organization.

History of the Ordnance Survey.—By J. J. Amos. Surveyor, March 25, 1910, 4½ pp.

An interesting article containing much information on the history of the English ordnance survey and on the methods of making it. A specially valuable part of the article is the description of the preparation of the ordnance maps.

PUBLICATIONS RECEIVED.

The Waterproofing of Structures with Special Reference to Sub-level Construction, the Envelope Method and the use of "Tunaloid."—Boston, Mass. J. A. & W. Bird & Co., 34-35 India St. Paper 6x9 ins. 45 pp. illustrated.

This trade publication is an excellent discussion of waterproofing, one of the important items in modern construction work. Half the pages contain matter that would not be out of place in a first class text book. The portion given over to a description of the materials manufactured by the company issuing the book is distinct from the technical discussion so the reader is not deceived or confused. It is an excellent example of good advertising.

The Fire Tax and Waste of Structural Materials in the United States.—By Herbert M. Wilson and John L. Cochrane. U. S. Geological Survey, Washington, D. C. Paper 6x9 ins.; 30 pp.

Gives data on fire waste, analysis of fire losses, causes of fire waste and cost of fire restriction. Comparisons are made with European figures.

Facts About the South.—By Richard H. Edmonds. Manufacturers Record Publishing Co., Baltimore, Md. Paper 6x9 ins.; 72 pp.

A statistical review of the industrial and commercial growth of the southern states.

Proceedings American Water-Works Association.—Published by the Association, Secy. J. M. Diven, Charleston, S. C. Cloth 6x9 ins.; 796 pp.; illustrated; $5.

Contains the proceedings, progress and discussions at the 1909 convention of the Association. A valuable collection of papers for any water-works engineer or superintendent.

Proceedings American Railway Bridge and Building Association.—Published by the Association, Secy. C. A. Lichty, 215 Jackson boulevard, Chicago, Ill.

Contains the committee reports and discussions and the business proceedings of the Association at its 1909 annual convention.

Report Ohio State Board of Health.—Published by the Board, Secy. C. O. Probst, Columbus, O. Cloth 6x9 ins.; 352 pp.

To engineers the parts of this report of most interest will be the vital statistics, and the reports of individual studies of water-supply and sewerage conditions at the various towns and cities of the state.

BOOK REVIEWS.

Practical Talks on Contracting.—Chicago, Ill. The Contractor Publishing Co. Cloth, 5½x8½ ins.; 128 pp.; illustrated, $1.50.

This book contains a collection of articles of practical interest reprinted from the "Contractor." Mr. Frank B. Gilbreth writes on "Systematizing a Contractor's Office." Mr. A. O. Davison has four articles: "Organization—How to Effect and Maintain It;" "Office System for Construction Work;" "Important Things to Consider in Estimating;" "The Operation of Camps and Commissaries." Mr. C. Arthur Warden writes on "Liability Insurance for Contractors," "Purchasing Records," "Tool and Equipment Records," "Daily Reporting System," "Earthwork Records." Mr. E. S. Hanson has an article entitled "Between Profit and Loss," and one on "How Contractors Use Photography." Reading matter like this is very good and the book can be recommended.

Oil Engines.—By A. H. Goldingham. Spon & Chamberlain, New York, N. Y. Cloth 4¾x7¾ ins.; 260 pp.; illustrated; $2.50.

This is a treatise on the oil engine as distinguished from the gas engine, that is it considers only engines burning kerosene, crude oil, coal oil, distillate, parafin, etc. It discusses first the design and construction of oil engines and second their erection, testing, installing, running and repairing. These second portions are, naturally, those which will most interest the construction engineer and contractor. The chapter on testing is particularly good, methods of conducting tests and apparatus used for testing being fully described. This chapter and chapters VII to IX, inclusive, on instructions for running oil engines, repairs and oil engine troubles are of practical value to the user. The remaining chapters take up oil engine design and construction facts, portable engines, etc. The present is the third edition of this book and it shows considerable revision of previous editions.

The October Number Contains

"Clay Products"

By A. V. BLEININGER,
Ceramic Chemist with the Clay Products Section of the U. S. Geological Survey.

An extensive paper on the work of the Section, giving results of tests on clay products used in construction work.

"Contracts for Structural Steel Work"

An extensive discussion by Attorneys, Architects, Engineers and Contract Managers, covering "Liabilities;" "Penalties," "Damages," "Arbitration," "Relations of Parties in a Contract," and "Payments." Forms of Contracts of unusual merit are given.

"Possibilities of Commercial Automobiles"

By W. W. MACFARREN,
Mechanical Engineer.

An illustrated paper with discussion covering commercial problems of transportation with data on costs per ton-mile, mechanical considerations, etc.

Proceedings
The Engineers' Society of Western Pennsylvania

50 cents per copy. $5 per year.

ELMER K. HILES, Secretary,
803 Fulton Building, PITTSBURGH

THE FIRST BOOK EVER PUBLISHED

On the Subject of "Cost Keeping and Management Engineering"

By HALBERT P. GILLETTE and RICHARD T. DANA

The Authors are pioneers in the field; and, although they have written much that has appeared in the form of articles—particularly in the pages of Engineering-Contracting—this book is the first presentation on the subject in a complete and logical sequence.

In this age of keen competition it is very essential that the business of contracting be conducted upon a systematic basis. This can be accomplished only by keeping a tabulated detail record of each job. You cannot afford to be without the **only** book published that gives these methods.

You Should Keep an Accurate Cost of Your Work and Understand How to Handle Men Economically

The Following Chapters Indicate the True Value of This Book

CHAPTER I—The Ten Laws of Management.

CHAPTER II—Rules for Securing Minimum Cost.

CHAPTER III—Piece Rate.

CHAPTER IV—Bonus and other Systems of Payment.

CHAPTER V—Measuring the Output of Workmen.

CHAPTER VI—Cost Keeping.

CHAPTER VII—Office Appliances and Methods.

CHAPTER VIII—Bookkeeping for Small Contractors.

CHAPTER IX—Miscellaneous Cost Report Blanks and Systems of Cost Keeping.

Cloth, 6x9 inches, 360 pages, 184 figures.
Price $3.50, net postpaid.

This Book and one Domestic Subscription to Engineering-Contracting for One Year $5.00

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The Transandean railway tunnel in Chile was formally opened on April 5. The tunnel, 12,000 ft. above sea level, is five miles long, and furnishes direct communication between Valparaiso and Buenos Aires.—A special committee of the Board of Estimate of New York city on April 6 decided to set aside $60,000,000 for new subway construction. This money will be used for the construction of the Broadway-Lexington Ave. subway and the Broadway-Lafayette Ave. subway in Brooklyn. Work on both routes will probably be started this year.—The stockholders of the Southern Pacific Co. on April 6 authorized the $50,000,000 increase in bonds on the company's property in San Francisco and San Mateo county, California. The proceeds of the bonds will be used to cover the original cost of the properties and to provide for their further improvement.—Two large contracts for work on the New York State Barge Canal were let last week. James Stewart & Co., 30 Church St., New York city, secured Contract No. 39 for dredging in the Oswego River between Three Rivers and Fulton, N. Y., and Lane Bros. Co., Altavista, Va., secured Contract No. 21 for work located near Rochester, N. Y.—Among the railroad construction contracts let recently are the following: Rinehart & Dennis Co., Washington, D. C., for six miles of work on the Carolina, Clinchfield & Ohio Ry. in Russell county, Va.; the Western Engineering Co., Emmett, Idaho, for grading the 19 mile extension of the Payette Valley Ry. in Idaho; the Alan Construction Co. for constructing the six mile traction line of the Beech Grove Traction Co. from Indianapolis, Ind.; W. P. Tierney & Co., Nelson, B. C., for constructing a 10-mile extension of the Kettle Valley lines; J. Hargrave & Co., Winnipeg, Man., for constructing the second line of double track for the Canadian Pacific from Winnipeg to Portage La Prairie, 56 miles; H. A. Whittier, Norwich, N. Dak., subcontract for 100 miles of team work on Great Northern Ry. from Surrey, N. Dak.; Dalton & Whyman, Amarillo, Tex., for two miles of street railway at Albuquerque, N. M.; the Utah Construction Co., Ogden, Utah, for constructing the Bingham & Garfield Ry., extending from Bingham Canyon, Utah, to Garfield, a distance of 17 miles; and George Webster, Winnipeg, Man., for the remaining 140 miles of the Tofield-Calgary branch of the Grand Trunk Pacific.—Bids for the first piece of work in connection with extensive levee and drainage improvements at East St. Louis, Ill., are being asked by the East Side Levee and Sanitary District, of that city. The contract, bids for which will be opened May 16, calls for the construction of a drainage channel for Cahokia Creek and includes 1,427,900 cu. yds. of excavation.—The Senate Committee on Commerce concluded its work on the river and harbor bill on April 8. The total amount of appropriations carried by the bill is $52,566,419, an increase of nearly $10,000,000 over the House bill. The more important additions which assisted in increasing the appropriations $10,000,000 were: The Ohio river, $1,000,000; the Hudson river, $1,000,000; North Carolina projects, $7,869,525; James river and other Virginia projects, $664,700; Texas rivers and channels, $350,000; Kentucky, $249,000; upper Mississippi river, all in Minnesota, $83,755; upper Missouri, $125,000.

Increased Cost of Railroad Building.

The greatly increased cost of materials and labor is held by many to be responsible for the fact that the railroads of the country are not undertaking greater amounts of new construction work at the present time. Some interesting figures on this increased cost of labor and materials were recently given by W. O. Winston of Winston Bros., railroad contractors, in an interview in a western paper. Mr. Winston stated that the increased cost was most apparent in the wages paid to labor. He stated that ten years ago the cost of building roads was 50 per cent less than it is today. At that time labor received from $1.50 to $1.75 per day and now receives from $2.25 to $2.50. Not only that, but with the increase in wages the efficiency of the men employed has decreased at an almost inverse ratio. At least the ratio of efficiency is 40 per cent less than it was 10 years ago. This is easily accounted for. When wages are high jobs are correspondingly plentiful and the men, knowing that they can hold their places with a minimum of effort, act accordingly.

Material of all kinds used in the construction of railroads has increased about 50 per cent, Mr. Winston stated. A team of heavy horses such as are used in grading is now valued at $600, where the team used to sell at $300. Their maintenance has proportionately increased, hay and grain of all kinds has nearly doubled in cost, as have many of the miscellaneous supplies. These things taken together have operated to advance the price of grading in level or prairie country from 12 to 18 cents per yard. In mountainous or hilly country, where steam shovels and other big machinery is used, the increase in ultimate cost has not been so large owing to the higher efficiency of the machines now in use over those of the last decade.

When's A Land Surveyor.

There has always been more or less ambiguity in the use of the term surveyor. Webster defines a surveyor as "one who measures land, or practices the art of surveying"; and he defines surveying as "that branch of applied mathematics which teaches the art of determining the area of any portion of the earth's surface, the lengths and directions of the bounding lines, the contours of the surfaces, etc., with an accurate delineation of the whole on paper." However, if there is any difficulty in defining the general term "surveyor," there should be none as regards the specific term "land surveyor," if the definition of the latter, which was formally adopted by the English Land Surveyors' Club in 1845, still holds good. The definition was as follows: "One who has learned the art of admeasuring and Delineating the Surface of a Country, is capable of Dividing, Allotting and Arranging for Inclosures, Commons or Waste Lands; or of Dividing or Allotting the Interest of those holding as Joint Tenants, Coparceners, or Tenants in Common, versed in the knowledge of the various products of Agriculture, their Values and Comparative Advantages, either as between Landlord and Tenant, Lord and Copyholder, Rector and Tithe paper, and in the relative Uses, Values and Mensuration of Standing or Fallen Timber, having at the same time a perfect knowledge of all that appertains to the Value, Contracts and Arrangement of Property in the character of Land Agent." If only as an example of anxious inclusiveness and a prodigal use of capital letters this definition is worthy of remembrance.

Big Doings in New York.

In New York city, where money talks louder than a megaphoned shrew fishwife, they are planning extensive construction work for the next few years. According to present plans, some of which are already under way, improvements involving the expenditure of $1,000,000,000 are to be made within the next 15 years. These plans include betterments and enlargements in nearly every field of municipal endeavor. Included in these plans is the construction of an adequate harbor at a cost of something like $100,000,000. This will be obtained by the conversion of the shallow and marsh lands of Jamaica Bay into a sheltered harbor having an area of 25 miles and affording hundreds of miles of wharfage. This new harbor, according to present plans, will also be made the terminal of the barge canal now being dug across the state to connect the Hudson River with the great lakes. New subways to cost about $200,000,000 are also proposed and the Board of Estimate has already authorized $60,000,000 to be spent at once on this work. Another improvement planned in connection with the city's means of transportation is the elevation or depression of intersecting streets at some of the busier points. Traffic on certain of the streets has now become so great that at certain busier points it will not be feasible much longer to have the streets cross each other at grade.

Blasting Damages.

Contractors engaged in construction in cities on which blasting is required are familiar with the many claims for damages to property along the work resulting from the use of the explosives. But it is seldom that they receive a more heartfelt appeal than the following, which Harper's Weekly asserts is an exact copy of a letter sent the claim agent of the Pennsylvania Railroad after the blasting for the tunnels leading to the new New York terminal had been finished. The writer was a Slav, who lived in one of the tenements on Thirty-first street:

"Dere Mr. P:—The panick is over. I want them sellar steps fixt rite off. My wife nere fell down last nite and like to broke her dam nec. Please send plumb and fix our bath tub. It soon be time for us to use him again."

The Western Pacific Ry. will probably build a branch to Reno, Nev., if present plans are carried out. A company has been formed to build a line from Reno to Verdi, where a connection will be made with the Verdi Lumber Co.'s road. It is then proposed to extend this road a distance of five miles to connect with the Boco & Loyalton R. R., which is controlled by the Western Pacific. The organizing company will in course of time, it is said, be taken over by the Western Pacific. Rights of way along the south side of the Truckee River have already been secured.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

CALIFORNIA.

The San Diego, El Cajon & Escondido Ry. Co., which projects a 60-mile line from San Diego through El Cajon to Escondido, has completed surveys and has partly secured the capital for the construction of its line. The time for awarding the contract has not been determined but it may possibly be let within the next 60 days. A. C. Riordan, San Diego, Cal., is President and G. W. Pursell, San Diego, is General Manager and Chief Engineer.

IDAHO.

The Western Engineering Co., Emmett, Idaho, has been awarded the contract for grading for the 19 mile extension of the Payette Valley Extension R. R. Co., of which H. E. Dunn, Payette, Idaho, is general manager.

MONTANA.

Albert Walker, Missoula, Mont., has about 4½ miles of North Pacific double track work between Missoula and DeSmet. This is light work and involves about 29,000 cu. yds. of earth excavation.

NEW MEXICO.

Dalton & Whyman, Amarillo, Tex., have been awarded the contract for constructing two miles of street railway in the Highland section of Albuquerque, N. Mex., for the Citizens Traction & Power Co., of which A. W. Hayden, Albuquerque, is President.

NORTH DAKOTA.

A. Guthrie & Co., St. Paul, Minn., have the contract for grading the Great Northern Ry. line from Fargo to Surrey, S. Dak., a distance of about 225 miles.

H. A. Whittier, Norwich, N. Dak., has taken 100 miles of Great Northern Ry. team work for A. Guthrie & Co., St. Paul, Minn. This work begins at Surrey, N. Dak., and runs southeast to a point 12 miles southeast of New Rockford. There is a lot of first class machine work and Mr. Whittier can use a few good machine outfits. The work runs about 25,000 cu. yds. to the mile. Contractors wishing to figure on the work can get transportation of A. Guthrie & Co., St. Paul, Minn.

OHIO.

The Cincinnati, Portsmouth, Pomeroy & Pittsburg Traction Co., which purposes the construction of a 466 mile electric railway along the Ohio River Valley from Cincinnati, O., to Pittsburg, Pa., will not take up the matter of letting contracts for at least 90 days. Surveys are well under way as noted in previous issues of this paper. C. P. Sanborn, Huntington, W. Va., is Chief Engineer.

TEXAS.

The Nueces River Valley R. R. has completed preliminary surveys and has partially received the capital for the construction of its proposed line. The company is projecting a line 175 miles long by way of Oatville, Tilden, Cotula and Eagle Pass. Construction contracts are to be let within 60 or 90 days. John Andrawatha, Austin, Tex., is Chief Engineer. Wm. A. Frisby, Beeville, Tex., is President.

The Pecos Valley Southern Ry. has completed surveys from Pecos, Tex., to a point on the Southern Pacific Ry., and construction capital has been secured for 45 miles of line. Contracts were let on March 1, 1910, to T. N. Brigance, Pecos, Tex. About ten miles of line have been graded and five miles of steel laid. The total projected length of this road is 95 miles and it is to extend from Pecos southwest passing through Saragosa and Balmorhea. W. L. Cawile, Pecos, Tex., is President, and L. W. Anderson, Pecos, Tex., is Chief Engineer.

VIRGINIA.

Rinehart & Dennis Co., Evans Bldg., Washington, D. C., has just been awarded six miles of work on the Carolina, Clinchfield & Ohio Ry. in Russell county, Va., the contract amounting to about $100,000.

WASHINGTON.

The J. H. Flick Construction Co., Chicago, Ill., is beginning work on its contract filling in bridges on the line of the Chicago, Milwaukee & Puget Sound Ry. The work involves about 1,000,000 cu. yds. of filling, as previously noted in these columns. The equipment used on the work consists of a new 70-ton Bucyrus shovel and a 65-ton Bucyrus shovel, 50 new 12-yd. Western air dump cars and four consolidation locomotives, 60 ton on drivers. The company is getting its camps up and already has one shovel installed and the other on the road. Conditions are good for construction work, but labor is somewhat scarce, although $2.25 per 10 hours is being paid. Wm. B. Michel, Kittitas, Wash., is superintendent of construction for the contractors.

WYOMING.

John Burke, Shoshoni, Wyo., has nine miles of especially good Fresno wheeler and machine work to let; free transportation for men and outfits over the Burlington lines. Mr. Burke also wants "three up" teams and will pay $8 per day for them.

Power Developments, Levees, Drainage and Irragition Works.

ILLINOIS.

Plans are being made for the construction of 12 miles of ditches for the Kishwaukee Drainage District in McHenry County. The estimated cost of the work is $40,000. Hugh M. Price, 1207 Hartford Bldg., Chicago, Ill., is the engineer.

Bids are asked by the Board of Trustees of the East Side Levee and Sanitary District, H. D. Sexton, President, Sexton Bldg., East St. Louis, Ill., until noon, May 16, for the construction of a diversion channel for Cahokia Creek and necessary levees and embankments and other auxiliary or incidental improvements, the work including 1,427,900 cu. yds. of channel excavation, 60 ft. of 30 in. cast iron pipe, 96 lin. ft. of 24 in. cast iron pipe, 70 cu. yds. of reinforced concrete, 22 cu. yds. of concrete at pipe ends, and 2 acres of grubbing. The diversion channel will have a bottom width of 100 feet, with side slopes of 1 on 2 on the land portion of the channel. Below this, will be excavated a low water channel 30 ft. wide on bottom and 2 ft. below the grade of the channel proper. The material excavated from the channel will be deposited in the levees on each side thereof, leaving a berm of not less than 50 ft between the toe of slope of the levees and the channel. The levees on each side of the channel will have a top width of 10 ft., slopes on the channel side of 1 on 2 and on the land sides 1 on 3. The proposed work is located in Edwardsville and Chouteau Townships, near Poag Station, Madison County, Illinois, on the Wabash Railroad and Edwardsville line of the Alton, Granite and St. Louis Traction Company, and Klinke Station on the Alton line of the Alton, Granite and St. Louis Traction Company, and is convenient to switch tracks of the Wabash C. & A., C. C. C. & St. L., C. & E. I. and C. P. & St. L. Railroads. The official advertisement will be found elsewhere in this issue.

INDIANA.

Gust. Strom, Miller, Ind., has been awarded the contract at $11,849 for constructing a drainage system for the town of Miller, the work consisting of 15,000 cu. yds. excavation, open ditch work, and 2,100 lin. ft. 36-in. reinforced concrete pipe.

LOUISIANA.

The Upper Terrebonne Drainage District is dredging a canal between Houma, La., and Schriever, La., some 12 miles. This will be a very important canal and will open up a large and fertile cane area. Bonds were issued and placed locally. It will take some 8 to 10 months to complete the work. The adjoining Parish of Lafourche is considering continuing this canal into Bayou Lafourche at Thibodaux, La. Charles V. Moore, Schriever, La., is Secretary of the Upper Terrebonne Drainage District Commission.

MASSACHUSETTS.

As previously stated in this paper bids are being asked by Lt. Col. J. C. Sandford, U. S. Engineer, Newport, R. I., for dredging in New Bedford at Fairhaven Harbors, Mass. The work to be done consists of dredging a channel between the wharf fronts of New Bedford and Fish Island for a distance of about 550 ft. below and 300 ft. above the New Bedford and Fairhaven Bridge, also the removal of any shoal spots that may be found in the waterway for an additional distance of 450 ft. above the area described. The work includes the dredging of about 36,000 sq. yds. of material.

MICHIGAN.

Bids are asked by Major C. S. Riche, U. S. Engineer, Grand Rapids, Mich., until 3 p. m., April 29, for repair of south revetment at Grand Haven, as previously mentioned in this paper. The work includes the removal of the old superstructure, the cutting down of the front row of old piles to the level of 1.0 ft. below zero of gage, the strengthening of the front wall by a new row of piles, the driving of a new row of rear piles, the connecting the front and rear walls by means of wales and tie rods and the building of a new superstructure. The following materials will be required: Oak piles, 73,518 lin. ft.; oak timber, 32,639 ft. B. M.; pine or Douglas fir timber 389,645 ft. B. M.; pine or Douglas fir plants for sheet piles, 4,460 ft., B. M.; pine or Douglas fir planks for walks, 26,514 ft., B. M.; drift bolts, 59,608 lbs.; screw bolts, 55,232 lbs.; angle irons, 51,610 lbs.; tie rods, 33,521 lbs.; spikes 1,178 lbs.; carriage bolts, 127 lbs.; pile shoes, 1,350 lbs.

NEBRASKA.

Contracts for the drainage work in District No. 2, Humboldt, Neb., mentioned in our issue of March 16, have been let to Callahan Bros., Munn & Reise, Canon City, Colo., and Omaha Neb., at $73,966. The contract includes the construction of 11 miles of new channel for the Nemaha River, requiring 810,000 cu. yds. excavation, 14,000 cu. yds. excavations in Long Branch Creek, 6,327 cu. yds. of levee and 2,640 squares of river cleaning. The contract for the three steel bridges was let to the Standard Bridge Co., Omaha, Neb., for $4,932. Bids for the work were opened April 4, and all work is to be completed by April 1, 1911.

NEW YORK.

James Stewart & Co., 30 Church St., New York city, have been awarded Contract No. 39 for dredging work on the New York State Barge Canal. The work is located on the

Oswego River between Three Rivers and Fulton, N. Y., and includes 1,226,000 cu. yds. of excavation, 11,072 cu. yds. of stone masonry and 6,000 lbs. of iron castings.

Lane Bros. Co., Altavista, Va., have been awarded Barge Canal Contract No. 21, which is located west of the Genessee River near Rochester, N. Y. The contract includes about 1,490,000 cu. yds. of earth excavation, 860,000 cu. ft. rock excavation and 6,500 cu. yds. of concrete masonry. It has not been decided as to whether any of the work is to be sub-let.

OHIO.

The Great Lakes Dredge & Dock Co., Cleveland and Chicago, Ill., was the low bidder April 2, for the dredging in the Cuyahoga River in the city of Cleveland. As mentioned in our March 30 issue this work is divided into two contracts, known as Section No. 1 and Section No. 2. No. 1 includes the lower portion of the river and No. 2 the upper portion. Bids were received based upon the approximate quantities of 225,000 cu. yds. in Section No. 1 and 300,000 cu. yds. in Section No. 2. The dredged material is to be dumped upon a dump established by the government in Lake Erie, a distance of five miles from the mouth of the river. The portion of the river to be dredged is about five miles in length.

WASHINGTON.

Geo. Cooke & Sons, Spokane, Wash., were on March 31, awarded the contract for constructing the Cowiche-Yakima laterals for the Tieton project of the U. S. Reclamation Service. The work includes 36 miles of laterals and involves 385,000 cu. yds. of excavation. Bids were opened March 15 at North Yakima.

WYOMING.

Bids will close April 20 for constructing the Covey Canal near Cokeville, Wyo., for S. M. Covey, of Cokeville. The work includes approximately 100,000 cu. yds. of earth excavation, 2,000 cu. yds. rock excavation and 4,000 cu. yds. embankment. The canal parallels the Oregon Short Line R. R., and is about two miles distant. It is to be 25 miles long, 15 ft. wide, and 2 ft. deep. Labor conditions in the vicinity are fair. This work was noted in our March 23 issue, the date for closing bids being given as April 15.

The West Jersey & Seashore R. R. Co., a Pennsylvania line, is planning to build a freight yard covering at least half a block at Atlantic City, N. J.

The South Carolina Western Ry. Co., of Hartsville, S. C., has been chartered and proposes to construct a 40 mile line connecting Florence and McBee. W. R. Bonsal, Hamlet, N. C., President of the North & South Carolina Ry., is also President of the new company.

About $600,000 of bonds are reported to have been sold by the Paradise Valley R. R., which proposes to contract a standard gage line from Winnemuca, Nev., to Paradise Valley, a distance of 42 miles. J. G. Jacobs, President of the American Safety Railroad Switch Co., of Salt Lake City, Utah, is interested.

The Bonnie Clare & Gold Mountains R. R. Co., has been incorporated with a capital stock of $150,000 and propose to build a line, some 14 miles in length, from Bonnie Clare, Nev., to Gold Mountain in Esmeralda County, Nevada.

Surveys have been completed and maps made for the projected line of the Aroyelles, Palmetto & Gulf R. R., which proposes the construction of a line from Marksville to Opelousas, La. Hollier & Neff, Opelousas, La., are the engineers.

The Board of Aldermen of Worcester, Mass., has granted the Providence & Worcester Street Ry Co. the right to use certain streets of the city. The company was denied the right to lay rails in other streets and will have to arrange with the company now operating in that city to use its rails. The company is reported as ready to begin construction this year and will pass through Milbury, Sutton, Manchaug, Douglas, Burrillville to Mohegan, and will then follow the Douglas pike to Providence, R. I. The line will be 45 miles in length.

The Pennsylvania R. R. has made a proposition to the city of Trenton, N. J., to abolish the present grade crossings at State and Perry Sts. One plan proposes to elevate the railroad tracks from a point near Greenwood Avenue to a point some distance north of Perry Street. It is proposed that the tracks be laid on a base of masonry about 12 feet above the level of the street. The company also proposes, as a part of this plan to remove the present canal lock at State Street to a point also north of Perry Street, materially reducing the time of present traffic interference.

The Buckhannon & Clarksburg Electric Ry. Co., of Buckhannon, W. Va., has been chartered with a capital stock of $250,000 and proposes to build an electric line from Buckhannon, through the counties of Upshur, Barbour and Harrison to the city of Clarksburg; over the streets of Buckhannon and South Buckhannon and through the counties of Upshur and Lewis to the town of Weston. The incorporators are E. W. Martin, G. O. Young, R. I. Perine, W. H. Fisher and U. G. Young, all of Buckhannon, W. Va.

The Public Service Corporation of New Jersey, Jersey City, N. J., has secured control of the Camden & Trenton Ry. Co., which went into receivers' hands about two years ago. The management is said to have devised a plan whereby it will be possible to make the run from Camden to the heart of New York City in five hours and fifteen minutes, against nearly ten hours, the present schedule. The plan calls for connection being made through the Newark terminal of the McAdoo Tunnel system.

The Chamber of Commerce of Pensacola, Fla., is considering building a line of road from the proposed line of the Pensacola, Mobile & New Orleans Ry. at Millview across into Baldwin County, thus giving rail connection with that section. The road would be about eight miles in length. It would be leased to the Pensacola, Mobile & New Orleans, which has already been constructed to a point a few miles north of Millview.

Committees have been appointed at Superior, Neb., and Deshler, Neb., to secure the construction of a railroad between the two places. Negotiations have been opened with the Rock Island. John Rodenberg, Deshler, is a member of the committee.

J. Hugh Walker has been awarded the contract for constructing the 15 mile line of the Kinder & Northwestern Ry., which is to extend from Kinder, La., across the Calcasieu River.

Berwick, La., has voted a 5-mill tax for the proposed Iberia, St. Mary and Eastern R. R. Berwick is to be the terminal of the road.

The Chicago & Northwestern Ry. will have active construction work started May 1 on a number of extensions, contracts for which are reported to have already been let. These include the extension from Belle Fourche, S. D., north to the Moreau River, which will mean about 40 miles of new road; from Pierre, S. Dak., to Gettysburg, about 40 miles, and also on the longer branch that is to run from Iroquois across to the Pierre-Gettysburg branch, a distance of about 112 miles.

The International Elevated Railroad Co. of Washington, a monorail concern, has been chartered at Dover, Del., with capital of $50,000,000. At the same time the Universal Motor Co. of Washington was incorporated with a capital of $5,000,000. It will build equipment for the proposed single rail systems. The incorporators named in both companies are George G. Schroeder, of Washington, and Charles G. Guyer and S. E. Becker, of Wilmington. The real interests in the two concerns have not been announced. It is stated that the company will build its first line in Brooklyn, N. Y.

The Pecos Development Co., of Estancia, N. Mex., recently organized, proposes to develop 6,000 H. P. from the falls of the Pecos River. A conduit will carry the total flow of the river nine miles and drop it though a penstock for a fall of 766 ft. This power will be transmitted to the Estancia Valley and Albuquerque. The company proposes to utilize this power for operating pumping plants for irrigating lands. The incorporators of the Pecos Development Co. are M. H. Fisher, Alamogordo, an electrical engineer; C. L. Cory, dean of engineering, University of California; H. F. Cory, general manager of the Southern California Development Co., and F. H. Fisher, a civil and hydraulic engineer, who has been connected with several large irrigation schemes in New Mexico, and has large power fillings in New Mexico.

The City Council of New Orleans, La., has adopted both the ordinances providing for the sale of a franchise for an extension of the West End Railroad to Spanish Fort and Milneburg and for a new franchise in Algiers, from the head of Morgan and Patterson Streets to a point below town on the river. The latter will probably be a start on the new Grand Isle line.

The Mexican Government has granted a concession to the Southern Pacific Ry. Co. to build a branch to the main line from Quila to Dorado. Ten kilometers of the branch must be built in one year and the remainder in the year following. The company has made a deposit of $3,000, in bonds of the Public Debt, guaranteeing the fulfillment of the contract.

The Mayoch Drainage Commissioners of Mayoch, N. C., have awarded a contract to the American Steel Dredge Co., Fort Wayne, Ind., for constructing drainage canals, requiring 733,000 cu. yds. of dredge work.

The Missouri Valley Engineering Co., of Vermillion, S. Dak., is preparing plans for a hydro-electric development to be constructed in the Black Hills near Rapid City, S. Dak., for the Dakota Power Co. The estimated cost is about $250,000.

A bill is before the Massachusetts Legislature to allow the New York, New Haven & Hartford R. R. to take over the Berkshire street railway system and to improve trolley facilities in the Berkshire District.

The Minneapolis & St. Louis R. R. is reported to have acquired the South Dakota Central R. R. and is said to be planning to remove the shops of the latter road from Sioux Falls to Watertown, S. Dak. This is said to be part of the plan for important extensions which will be carried out by the Minneapolis & St. Louis as the controlling interest in the South Dakota Central.

A. Guthrie & Co., St. Paul, Minn., who have the contract for grading the Great Northern line from Fargo to Surrey, N. Dak., have sublet 25 miles of the work to Edward Swerington of New Salem and James Tobin. Mr. Tobin has been working on Great Northern contracts near Culbertson, Mont. Contractor Swerington has a force of 65 teams which have been wintering at New Salem and was engaged in grading on the N. P. extension west of the river last year.

The taxpayers in the Eighth ward of St. Mary Parish, in which is the town of Berwick, for the purpose of voting a 5-mill tax for a period of ten years in favor of the Iberia, St. Mary & Eastern R. R.

Items Concerning Contractors and Their Work

RAILROADS. POWER DEVELOPMENTS. LEVEES. DRAINAGE AND IRRIGATION WORKS

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The construction of an electric railroad from Decatur to Russellville, a distance of about 50 miles, is proposed and it is believed that there is a possibility of the line being built at an early date. It is proposed to have the line start at the union depot in Decatur and run westward to Curtis Wells, a summer watering resort a few miles from Decatur, then on to Neal, Danville, Jesseton, Needmore, Moulton, Landersville, Mt. Hope, Neburg and to Court square in Russellville. W. J. Cottingham, New Decatur, Ala., is interested.

Charles W. Eckert of Lancaster, Pa., President of the Gold Ridge Company of Alabama, and others are reported to have purchased the railroad of the Vanderbilt Timber & Mining Co., between Tallapoosa, Ga., and Hopewell, Ala., and may extend the line to Wedowee and Montgomery.

The Chattahoochee Valley R. R. is reported to have engineers in the field making surveys for an extension of the line down the Chattahoochee River to Phenix City. It is also said that instead of going to Phenix the road will reach Motts on the Central of Georgia.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Prescott, Reader & Fordyce R. R., now operating nine miles of standard gage line between Reader and Lyda, has decided to build from both ends of the line and to connect with the Iron Mountain at Prescott and with the Cotton Belt at Fordyce. W. B. Ferguson, Little Rock, Ark., is president.

The St. Louis, Iron Mountain & Southern Ry. (Missouri Pacific system) is reported to be planning to build an extension from Womble, the present northern terminus of the Gurdon and Fort Smith Northern railroads, to Greenwood, the present southern terminus of the Greenwood branch of the Iron Mountain. E. F. Mitchell, St. Louis, Mo., is engineer of construction, Missouri Pacific Ry.

The McCrory Transportation Co. has been organized at McCrory, Ark., and the company proposes to build a railroad from there 16 miles north into Jackson county. The officers of the company are: President, B. Hailey; vice president, E. A. Hamilton; secretary and treasurer, Bruce Keating.

The Pike County Water Power Co. has engineering work under way for its proposed electric power development at Murfreesboro, Pike county. About 10,000 h. p. will be developed. W. A. Fuller, St. Louis, Mo., is engineer.

The State Board of Railroad Incorporators has granted the Hot Springs, Glenwood & Western R. R. Co. a charter. The road is capitalized at $350,000 and will be 35 miles long extending from Glenwood, Pike County, to Hot Springs. The incorporators are A. L. Clarke, J. A. Bonner, W. E. Mayber, C. T. Crosby, and S. W. Pryor.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Boca & Loyalton R. R., A. H. Otis, manager, Loyalton, Cal., is reported to be securing right of way from Reno to Boca along the Truckee with a view to extending its line to Reno to a connection with the main line of the Western Pacific.

A company has been formed for the construction of an electric railroad from a point near Hemet, through the San Jacinto and a portion of the Perris valleys and to Moreno, a distance of about 20 miles. The line will be the first part of a road that later will connect either with Redlands or Riverside. A. G. Hubbard, Redlands, and E. H. Grigsby, Santa Monica, are interested. The latter has recently filed upon about 300,000 ins. of water on the north slope of the San Jacinto mountains and will build a power house at Florence, a town about seven miles from Hemet, to furnish power for the electric line and other enterprises in that section.

The Oakland Dock & Warehouse Co. has begun work in the reconstruction of nearly a third of a mile of its wharves between Alice and Fallon Sts. at Oakland. Similar work is being done by the Pacific Steel & Wire Co., the Hogan and Sunset lumber companies and other private corporations having frontages on the estuary.

Francis B. Smith, superintendent of the Scofield Construction Co., which has just completed the Mare Island dry dock, left Vallejo for Washington, D. C., where he held a conference with the naval officials relative to the dock at Pearl Harbor, Hawaii, the construction of which he is to superintend for the contractors.

The Santa Monica Harbor & Improvement Co., which is planning extensive lumber improvements at Santa Monica, is said to be ready to receive plans and estimates from engineers and contractors for the initial portion of the work. There is to be constructed a breakwater of some 4,000 ft. long, bulkheads of about 5,000 ft., also wharves, etc.

The Consolidated Reservoir & Power Co. has begun work on its project for the diversion of the Whitewater river in the San Bernardino mountains, northeast of Banning. W. E. Pedley, Riverside, is engineer in charge.

A project is under consideration for the construction of a railroad from Red Bluff to Eureka by way of Camp Wrigley on Tom Head Mountain, in the western part of Tehama County. William Wrigley, Jr., of Chicago, Ill., owner of the copper mines at Camp Wrigley, for which the road would furnish an outlet, is reported to be interested.

Marin County Citizens have begun an active campaign to construct a street railway from Corte Madera, through Ross Valley towns and San Rafael, to McNears point. Frederick Butterfield has been delegated by the San Francisco interests to look over the field. It is estimated that the road would cost $125,000 and an effort is being made to raise $65,000 in order to float bonds for the balance.

The Vallejo & Northern R. R., which proposes the construction of a railroad from Sacramento to Vallejo, has secured all right-of-way and is reported to have placed the bonds for the construction of the road. The road between the terminals Vallejo and Sacramento is to be double tracked and will cost $6,000,000. Construction will be commenced at Suisun. P. H. Haviland, Oakland, Cal., is Chief Engineer.

Klippel & McLain are making excellent progress with the grading work between French Creek and Stanwood for the Truckee Lumber Co's. railroad. Grading is now under way beyond Stanwood and it is understood that ten miles of the road beyond that place will be constructed this year.

Erickson & Peterson are making good progress with their work on the Southern Pacific cutoff near Bowman, and will complete one-half of the job within the next four months.

Bids were opened Apr. 10 at Marysville for the construction of the canal for the Hallwood Irrigation District. The water is to be diverted from the Yuba River at a point just above Daguerre point. The area that is thus benefited will be some 10,000 acres. The canal will be 8 ft. on the top and 6 ft. on the bottom and 3 ft. in depth. L. B. Crook, Room 14, Empire Block, Marysville, is the engineer.

Nearly 16 miles of grade on the Sacramento & Sierra Ry., which is building an electric railway from Sacramento, is completed, and grading work is being rushed in the vicinity of Orangevale. Surveys have been completed and practically all right of way has been secured.

Charles W. Corboley, Los Angeles, has the contract for constructing nine miles of levee along the Santa Maria River from Fulgers Point to the Pacific Ocean. The contract amounts to about $40,000.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The directors of the Kansas-Colorado R. R. Co., Pueblo, have authorized an issue of $3,000,000 of bonds, with a view to at once starting work on the completion of the line from Pueblo to Canon City.

Grading work on the Laramie, Hahn's Peak & Pacific from Fox Park, Wyo., to Walden, Colo., has been resumed, and it is expected that the road will be completed to Walden this year.

The Colorado & Southern Ry., H. W. Cowan, chief engineer, will during the next 12 months reballast and lay heavy steel rails between Greeley and Fort Collins, involving an expenditure of $200,000. Decision will also be reached this month on the question as to whether the Colorado & Southern will build from Fort Collins to Cheyenne. There is little doubt but what this will be done. The road then will be extended to Orin Junction, Wyo.

The Union Pacific started work on April 4 on its branch line which is to connect Lasalle and Dacona. This new branch, which is to be known as the Denver-Lasalle line, when complete, is being started at Lasalle and will be constructed toward Dacona, a distance of 25 miles. The section from Denver to Dacona is already under construction, the work starting at Sand Creek on the Denver end and going toward Dacona. This branch will also be part of the new Denver-Fort Collins line, which is to be constructed in the future. The extension to Fort Collins will start at a point about ten miles from Lasalle.

The Denver & Colorado Springs Electric Ry. Co., R. E. Van Duesan, secretary, has asked the commissioners of El Paso county for permission to cross county roads three times in the vicinity of Table Rock. More than 20 miles of this road will be built within the limits of El Paso county.

J. H. Williamson has been awarded the contract for constructing a dam at the Lone Starr reservoir, about six miles northwest of Delta. The contract amounts to about $22,000 and calls for a dam 150 ft. long by 30 ft. high.

The Boyd Lake Reservoir & Irrigation Co., recently incorporated with a capital stock of $4,000,000, proposes to utilize Boyd Lake for its irrigation scheme. It is planned to form an irrigation district and lift the water 90 ft. by pumps and water a big territory. The water is available by a system of transfer for use on hand on the Platte and wherever used it is probable that irrigation districts will be formed to handle it. It is said that one of the first steps of the company will be to issue $200,000 in bonds. B. D. Sanborn, Greely, is interested.

Advices from Idaho Springs state that John McColl, Superintendent of the Lucania Tunnel & Mining Co., will at once let a contract for driving the mining tunnel. The present plans call for 500 ft., and it is almost a certainty that a larger contract will be let when this is completed. The breast of the tunnel is 4,209 feet into Bellevue mountain, and 47 veins have been intersected. These have been developed by about 1,500 feet of laterals.

The Antero Land & Irrigation Co., of Denver, has commenced work upon the extension of the High Line canal. The company intends to provide water for a large area of farm land north of Denver. The canal, when completed will be almost 20 miles in length

and with laterals aggregating many miles will supply water in all directions north and east of Denver. The company is preparing to survey a line for the canal that will make possible the distribution of water over a vastly larger area than is possible to serve at the present time. The main ditch or canal is being enlarged as far as Plum Creek to permit the transportation of a larger flow of water and laterals will soon be started.

The Desert Ditch & Colt Reservoir Co., A. W. Colt, President, is said to be ready to expend about $2,000,000 on the project of reclamation just as soon as the state will throw the land open to settlers, so that there may be buyers for the water the company proposes to offer. The enterprise includes reservoir near the west end of Otero County and several ditches and laterals covering the great tract of land below. Water to fill the reservoir is to be taken from the Arkansas River in Pueblo County and carried to the reservoir through the Desert ditch.

The U. S. Reclamation will construct by force account the necessary distribution system of canals on the west side of the Uncompahgre River, on the Uncompahgre irrigation project, Colorado. The work in this connection will be scattered over a considerable area and consists principally of the construction of small ditches and structures necessary for the operation thereof. It is estimated that the work will cost about $50,000.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Louisville & Nashville, Atlanta & West Point and the Georgia railroads will build at once an elevated driveway the entire length of the south side of the Louisville & Nashville freight depot at Atlanta, Ga. The roadway will be 800 ft. long and will cost about $50,000. C. A. Wickersham, Atlanta, Ga., is general manager of the Atlanta & West Point R. R.

The Athens Railway & Electric Co., with a capital stock of $1,050,000, has been chartered and proposes to construct an electric plant and operate street cars on the streets of Athens. The incorporators are John R. White of Whitehall, Ga., J. Y. Carithers, W. S. Holman, A. H. Hodgson, C. D. Flanigan, Billups Phinizy, James White, J. M. Hodgson, J. W. Morton and W. T. Bryan, all of Athens.

The Florida Central R. R., J. L. Philips, President, Thomasville, Ga., according to reports, is planning to construct a 10-mile extension.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Work on the Burley-Oakley extension of the Oregon Short Line has been resumed after a layoff by the force of several months during the winter. If the weather continues favorable, it is expected that trains will be running from Burley, Idaho, to Oakley inside of three months.

The Utah Construction Co., of Ogden, Utah, is making good progress with its double-track work on the Oregon Short Line between Pocatello and McCammon. The double track has been completed between Pocatello and Inkom and a large force of men and a great deal of material are on the ground east of Inkom rushing the work between that town and McCammon.

Advices from Lewiston state that the Northern Pacific will have engineers placed on the North Fork early next month to complete the survey into the timber belt. E. L. Dorset, Ahsahka, is in charge of the surveys. Other Northern Pacific engineers are now engaged in making a permanent location into the Weippe section for a distance of 30 miles.

The owners of the Monitor mine at Adair in Shoshone County are to run a long tunnel from Adair about 5,500 ft., giving a working depth of 2,200 ft. N. Samuels, Wallace, Idaho, is interested.

The Oregon Short Line Ry. officials are stated to have announced that they will complete the extension of the Minidoka & Southwestern Ry. from Buhl to Nyssa upon the assurance of the construction of the Owyhee high line project. Similar assurances have been made to the promoters of the Twin Falls-Bruneau project, upon the same conditions.

The Oregon Short Line has purchased considerable land at Glenns Ferry and residents of that place think the railroad is to increase its present facilities at Glenns Ferry by the construction of additional shops.

Surveys for the Gilmore & Pittsburg Ry. extension will be completed to Lewiston, about June 1. The survey follows the Idaho side of the Snake River from the mouth of the Salmon River into Lewiston. Sometime ago it was reported that the railroad had awarded the contract for the construction of 40 miles of line down to Salmon River from the present terminus at Salmon City.

The Payette Valley extension R. R. Co., of Payette, opened bids April 5, for the grading of about 19 miles of roadbed between New Plymouth and Emmett, Idaho.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Peoria & Galesburg Interurban Ry. Co., S. F. Atwood, President, has for the second time applied to the city council of Peoria for a franchise allowing it to enter the city of Peoria. The company asks for rights on Hamilton from Jefferson down to Washington, thence south to Cherry, to Oakland, thence to Starr and to the western city limits.

The Cleveland, Cincinnati, Chicago & St. Louis Ry., has made plans and blue prints for enlarging its yards at Mattoon.

The Rock Island Southern Ry., which has been under construction for about three years is now practically completed and a branch from Aledo Junction to Aledo, about 10 miles, will be completed by July 1. The road which is about 100 miles long, connects Moline, Rock Island and Davenport on the Mississippi river with Monmouth and Galesburg. The line was built by E. C. and M. A. Walsh, bankers of Clinton, Ia., and its headquarters are to be in Chicago where an office has been opened in the Monadnock Building with E. C. Walsh as president and J. A. Hanley, formerly freight traffic manager of the Santa Fe and later of the Kansas City Southern, as vice president in charge of traffic.

The Tri-City & Northeastern Interurban R. Co., is having surveys made of two new routes for its projected line from Albany south. One of the surveys will be from Hampton across to Silvis and into Moline and the other from a point one and a half miles above Hampton to Silvis and into Moline. Wallace Treichler, Rock Island, Ill., is the engineer.

The Cairo & Thebes R. R. has been granted a connection with the Thebes bridge by the Railroad Commission. This company was formed in 1905 by Cairo shippers to build a road connecting Cairo with the railroads centering at the Thebes bridge. It was financed in Louisville, Ky., and it is generally reported that the Louisville & Nashville furnished the money. The sum of $2,000,000 was appropriated to build the road, half of which was for a terminal in Cairo. Grading work is under way, the contract being held by S. R. H. Robinson & Son Contracting Co., of St. Louis, Mo., as stated in our March 23 issue.

A proposition is under consideration for the construction of an electric railway from Freeport to Dixon. It is planned to have $200,000 in stock subscribed before starting work in securing the right of way. Of this sum over one-half is reported to have been subscribed. A. Merrill and J. Wilson, of Chicago, are interested.

Construction work on the Springfield-Jacksonville interurban line is now under way. The contractor for this road is J. H. Farland, Jacksonville, Ill., as previously mentioned in this paper. The company has been recently reorganized and the following officers elected: President, O. J. Lucas, Latham; Vice President, D. T. Torrence, Decatur; Treasurer and Secretary, D. H. Sims, Latham; Chief Engineer, T. S. Davy, Lincoln; General Manager, J. H. Farland, Jacksonville; Attorney, Albert Salzenstein, Springfield; Assistant Engineer, A. C. Brown, Columbia City, Ind.

A court decision has been handed down in the Spring Lake drainage case, sustaining the commissioners who seek to drain the lake and the widely known tract will be eventually converted into farming land.

The Freeport Railway, Light & Power Co., of Freeport, is preparing to at once extend its tracks from the present terminal on North Galena Avenue to a point on the west side of Whistler Street.

G. E. Hixon of the Egyptian Traction Co., has applied to the Board of Trustees of Carrier Mills for a franchise to operate an electric line at that place. A similar application has been made at Eldorado. The line as already surveyed is approximately 100 miles long, and will connect the McKinley lines in Illinois and the McCullough lines in Indiana.

The Chicago, Milwaukee & St. Paul R. R. will shortly begin work on the installation of the Hall safety signal system. Several months ago the surveys for these were made, and in addition to the wells for the support of the uprights, all material is being shipped to the different stations.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Fort Wayne & Springfield Traction Co., W. H. Fledderjohann, President, Decatur, has accepted the franchise granted the road from Portland to the Adams county line. It is said that work will soon be begun on the extension of the line southward and that it will be completed from Decatur to Portland by Sept. 1.

The Lake Shore & Michigan Southern Ry., is to expend $50,000 for a new freight house and yards at Goshen.

The Evansville Ry. Co., Evansville, is to extend its electric line to Grandview, six miles east of Rockport, and residents of Chrisney have raised a bonus of $20,000 for an extension to that place.

Right of way is being secured between Crawfordsville and Terre Haute, by Samuel D. Symmes, a real estate dealer of Crawfordsville, acting for a New York syndicate, which proposes to build a new traction line for Crawfordsville to St. Louis, by way of the Shades of Death and Terre Haute.

The Toledo & Indiana R. R. recently purchased from the receiver has been reorganized and will hereafter be operated under the name of the Toledo & Indiana Traction Co. Several improvements are planned, including the purchase of new rolling stock and the extension of the road from Bryan to Fort Wayne, Indiana, in the near future. In making the improvement the company will follow the right-of-way paralleling the Lake Shore & Michigan Southern and passing through Butler, Ind. The officers of the company are: President, S. C. Schenck; vice president, S. D. Carr; secretary, C. F. Chapman, Jr.; treasurer, D. D. Schenck; directors, S. C. Schenck, S. D. Carr, Thomas H. Tracy, D. D. Schenck and C. F. Chapman, Jr., all of Toledo, O.

Preliminary arrangements are said to have been made for the extension of the Kokomo & Marion Traction line from Kokomo to Frankfort, work to commence at once, the line ultimately to extend to Terre Haute.

The Beech Grove Traction Co., Ætna Bldg., Indianapolis, has awarded a contract to the Alan Construction Co., for the construction of its traction line between Indianapolis and Beech Grove. Orders have been placed for rails, ties and cars. The officers of the traction company are as follows: W. H. Ogan, president; John Wocher, vice-president; C. Frederick Schmidt, secretary; Morton S. Hawkins, treasurer.

The Erie R. R., is to enlarge its yards at Kent this season, and will also double track the division from Kent to Galion.

Work has started on the construction of the fourth track of the Lake Shore & Michigan Southern Ry. from LaPorte to Pinola.

Residents of Grandview have subscribed for $30,000 of bonds thus securing the extension of the electric railroad from Rockport to

Grandview. The road will be extended by the Tennis Construction Co., of Philadelphia, Pa.

The city of Hammond has granted the Eastern Illinois Traction Co., a subsidiary to the Consolidated Railways Co. of Chicago, a 50-year franchise in West Hammond. A line will be built to Dolton and Harvey within four months and a new territory opened up between Hammond and South Chicago. This is the line destined, according to Ira M. Cobe of the Consolidated Railways Co. to become an interurban inlet from Indiana to Chicago.

The Indianapolis & Cincinnati Traction Co., now in the hands of a receiver, is to be reorganized and will build an extension from Connersville to Hamilton, O. The extension will be about 30 miles long. Charles L. Henry, Indianapolis, is receiver.

Iowa Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Iowa & Dakota Interurban R. R. Co., has been incorporated with a capital stock of $500,000 and headquarters at Yankton, S. Dak. The company proposes a line from Sioux City to Mitchell, a distance of 125 miles, at an estimated cost of $20,000 a mile. It crosses the counties of Woodbury and Plymouth in Iowa, Union, Clay, Turner, Yankton, Hutchinson, Hanson and Davidson, in South Dakota. L. F. Phillips and W. G. Kirkpatrick of Wagner, S. Dak., and Albert Amundson, Lake Andes, S. Dak., are interested.

The St. Paul & Des Moines R. R., H. L. Jackson, chief engineer, Iowa Falls, Ia., is said to be considering extending its lines southward from Des Moines to connect with the Milwaukee and Rock Island Kansas City lines at Seymour in Wayne county. Such a line would involve building about 80 miles of road.

The citizens of Waverly will vote on April 12 upon the question of extending a franchise to the Waterloo Cedar Falls & Northern Railway Co. to extend its line from Denver into Waverly. In case the people of that city vote the proposition down the railroad company then will run its line into New Hampton instead of Waverly. In case they go to New Hampton they will pass through two towns, Tripoli and Fredericka. Harrington Bros., St. Louis, Mo., have the grading contracts.

The Federal Construction Co., of Muscatine, Ia., has been organized with a capital stock of $10,000 to further the construction of the waterway connecting the Cedar river with the Mississippi at Muscatine. Eastern capital is reported to be interested and it is said that the construction company has been formed to take care of preliminary matters. N. Barry, Jr., S. G. Stein, B. Layton, J. S. Blackwell, and J. M. Kemble are incorporators. Preliminary surveys were made under the direction of B. Layton of Chicago.

The Davenport Water Power Co., of Davenport, has started preliminary work in its water power dam to be erected in the Mississippi river. Charles Francis is engineer in charge.

The Chicago & Great Western Ry. has been unloading steel ties and other material along its line between Belmond and Mason City, preparatory to putting in heavier rails.

The stockholders of the Des Moines & Sioux City Electric Ry. Co., C. E. Russell, Auditor, Adel, are to hold a meeting at Des Moines on April 14, to act up on the proposition of changing the articles of incorporation of the company with the view of re-location of the proposed line of road.

The Chicago, Burlington & Quincy R. R. is to make extensive additions to its yards at Burlington.

Dennis McCarthy, aged 64 years, formerly one of Sioux City's prominent grading contractors died April 3 in that city. He was stricken by an attack of pneumonia a few days ago. During the old days in Sioux City Mr. McCarthy was one of its prominent men and had many large contracts for grading and other work of this nature. He was a member of the old contracting firm of McCarthy & McMahon of the boom days. In recent years he has been employed by the city.

Kansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The MacArthur Bros Construction Co., Chicago, Ill., is reported to have purchased the rights and franchises of the Topeka Southwestern Ry. the proposed line from Topeka to Council Grove, the grading of about twelve miles of which has been completed. It is said that MacArthur Bros. intend to begin the construction of the line in about 90 days and expect to complete it by the end of this year.

The Kansas Union Traction Co., has permanent surveys under way for its line from Coffeyville to Parsons. In addition this company is figuring on a line from Cherryvale to Oswego to cross the Coffeyville-Parsons line near Altamont where the power station will be located. Barney McDaniel, Altamont, is Secretary.

The Union Pacific R. R., R. L. Huntley, Chief Engineer, Omaha, Neb., is planning to ballast this year over 200 miles of its branches in Kansas. Information has also been received by the State Railroad Board that the Union Pacific will complete its Topeka-Marysville line this year. The road now runs as far as Onaga about half way and it is said that money is forthcoming to build the rest of the line and also to ballast the whole branch.

Maryland Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Cumberland & Westernport Traction Co., of Cumberland, Md., is to have surveys made for an extension of its line from Westernport to Keyser, W. Va.

The directors of the Frederick Railroad Company, of Frederick, formed by the merging of the Frederick and Middletown and Braddock and Jefferson trolley systems and the Washington, Frederick & Gettysburg steam road, are considering electrifying the latter road. The directors have authorized the purchase of the right-of-way from the Baltimore turnpike at the end of East Patrick Street, through the property of the Frederick Improvement Co., to connect the Frederick and Middletown trolley line with the Washington, Frederick and Gettysburg road. A car barn and repair shops will be erected near the connecting point. George S. Anderson is manager.

The Elkton, Fairhill & Oxford Electric Railway & Power Co., of Elkton, Md., recently incorporated with a capital stock of $50,000, proposes to build a line from Elkton to Cherry Hill and Fair Hill, and thence to the Pennsylvania boundary, whence it may extend to Oxford, Pa. The incorporators include Geo. E. L. Hess, Heister Hess, C. P. Canriet, and John Lungren.

Michigan Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Port Huron Southern Ry., Otto Huette, General Manager, Port Huron, is to build a spur to a salt mine which the Port Huron Salt Co. is to establish in the vicinity of Rattle Run in Columbus Township. The railway is also said to be considering extending its line to Detroit.

Grading between Morrice and Shaftsburg, on the Lansing, Owosso & Flint Electric line is about completed and the Northern Construction Co., of Lansing, which has charge of the work, expect to have cars in operation between Lansing and Durand by Oct. 1.

L. W. Anderson, formerly city engineer of Grand Rapids, and Charles J. Carpenter of Grand Rapids, have formed a partnership and will conduct a general contracting and engineering business under the firm name of Carpenter & Anderson. The firm will devote itself largely to municipal contract work. In addition to the contracting it is expected engineering work along the consulting line will be handled with Mr. Anderson directly in charge of this department.

Minnesota Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Duluth & Iron Range R. R. has let a contract to G. H. Spurbeck for building a 300-foot addition to the coal dock at Two Harbors, which will increase its storage capacity to 174,000 tons and a pocket capacity of 3,700 tons. Work has been started.

John and Will Gross, of Pipestone, have begun work on their $3,500 contract for changes in Pipestone Creek.

Missouri Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

H. G. Horton, City Engineer of Springfield, is to make surveys of the Jordan through Springfield preparatory to making plans and specifications and estimates of cost of improvements with a view of making the creek as sanitary as possible. The plans will provide for widening the bed of the creek and deepening the channel.

Contracts are reported to have been let for grading for the interurban line between St. Joseph and Savannah. The town council of the latter place has just granted a franchise to the new road for the use of Maine and 1st Streets. It is planned to have the line in operation by Aug. 15. J. H. Van Brunt, St. Joseph, Mo., is General Manager.

The tragic death of John Mahoney in a motor car accident in Kansas City, Jan. 24 last, removes from the contracting profession a widely known and highly respected railroad contractor. Mr. Mahoney had been in the contracting business for many years and had several large grading and crusher plants in Kansas City, Kan., and Kansas City, Mo. He started in a poor boy, but at the time of his death he was currently reported to be worth $500,000. He had worked hard all his life, taking very little time for rest or recreation. He was a plain, unassuming man and was especially popular with his employees. He maintained five camps and personally looked after them and the welfare of his men. Mr. Mahoney's wife and his foreman, Thos. McGuine were also killed in the accident.

L. D. Keeler, of Kansas City, has applied to the Park Board of that city for a franchise for a 4-mile 22-in. gage railroad in Swope Park. The line would be operated by steam or electricity and would be used to transport visitors to the park from the entrance to various places of interest.

Montana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Preliminary surveys have been made for the construction of the projected electric railway of the Virginia City Southern Electric Ry. Co., from Virginia City, Mont., to Adler. Luther H. Leber, New York City, vice president of the company was authorized to sell the bond issue for $200,000, and he was also awarded the contract to construct the line and supply the equipment. He guarantees to have the road completed and in operation by Sept. 1, 1910. Karl Elling, Virginia City, Mont., is President.

The Gallatin Valley Electric Ry., C. B. Anderson, General Manager, Bozeman, Mont., is stated to have awarded grading contracts for its proposed extension to Three Forks. The line will extend from the Bozeman Hot Springs for a distance down the West Gallatin river and then across country to Three Forks, a total of 27 miles. The sidings and switches will make a total of 30 miles of rails to be laid this summer. It is planned to have the road complete and freight and passenger service installed by Oct. 1.

Residents of Townsend have had surveys made and have pledged much money for building an electric railway between that city and Radersburg. It is now proposed to build this line down the east side of the Missouri River Canyon Ferry.

Clifton & Applegate, Bonner, are making good progress with their contract on the Big Blackfort Ry. This road starts at Bonner and crosses the river just above the Big Blackfoot mill from the east side to the west. It runs

along the west side for the entire distance, which is about 12 miles, until it reaches McNamara's landing, where it recrosses to the eastern bank. The bridge work is being done by the Bates & Rogers Construction Co., of Chicago, who are now working on the new bridge on the Big Blackfoot. The bridge is to be a steel and concrete structure, with about 400 feet base line. The foundation will be entirely of concrete, while the superstructure, which is about 240 feet in length, is to be of steel.

The Northern Pacific Ry., is said to be planning in expenditure this year of about $1,000,000 for repairs, renewals and improvements on what is known as the lines west of Trout Creek, Mont. About half the sum will be spent for new steel for the main line which is to be renewed with 90-lb. rails throughout the entire district. The company is also said to be considering widening the cuts through the mountains. This will cost a large sum because of the heavy work that will be necessary.

The Chamber of Commerce of White Sulphur Springs is taking steps to raise loans to secure the construction of a branch line of the Chicago, Milwaukee & St. Paul Ry., from Dorsey to White Sulphur Springs.

New York Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Westchester Northern R. R. Co., Leverett S. Miller, President, 63 Beaver St., New York City, is planning to call for bids for construction work, as soon as the State Railroad Commission grants permission to construct a proposed line from White Plains north to the Connecticut state line. The company is anxious to get at work upon the line between White Plains and Danbury as quickly as possible and it is thought that contractors will have operations under way by early summer —perhaps sooner. The Westchester Northern is a part of the New York, Westchester & Boston R. R. enterprise.

Cunningham & Woodward, of Hudson Falls, have been awarded Barge Canal contract No. 78, calling for the construction of a dike in the Oswego River near Fulton. The contract price was $47,721. Barge Canal Contract No. 39, for dredging the Oswego River between Three Rivers and Fulton was let to James Stewart & Co., of New York. The contract price of the work is $1,048,674.

The City & Suburban Ry Co., has been incorporated with a capital stock of $230,000 and proposes to operate a line between Ridgewood, Brooklyn and Amityville, a distance of 23 miles. The directors are William W. Burroughs, I. T. Flatto, L. C. Neuberger, all of New York City.

The receivers of the Metropolitan Street Ry. Co., of New York City, have been authorized to spend approximately $510,000 for restoring the Eighth Avenue Railroad Co., a leased line, to good working order.

Ohio Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

All details for financing the proposed Canton-Youngstown Electric railroad are reported to have been completed and it is said that grading work will be started next month. Milton Shaeffer, Canton, is interested.

The Pennsylvania R. R. will soon begin work on the construction of new yards just below those already situated at Stark Siding, at Canton. Some material is already on the ground.

The Cleveland Ry. Co., of Cleveland, has purchased 8,000 steel ties and 1,000 tons of 103-lb. girder groove rails from the Lorain steel works. The ties and rails are to be used in renewing worn out tracks at Cleveland.

The Pennsylvania R. R. is to improve its yards at Crestline, the work involving the expenditure of about $125,000.

The Baltimore & Ohio Rv., will at once proceed with the improvements on the river north of the Erie Ave. viaduct at Lorain. The improvements to the docks at this point will involve an expenditure of $1,000,000 at present and a greatly larger sum ultimately. Later a boat slip approximately 600 ft. long will be built at a point opposite the life saving station. The unloading machinery will be built by the Brown Hoisting Machine Co., of Cleveland, and will include two fast clamshell plants with necessary conveyors. The contract for the whole improvement has been awarded to P. Farrell, Cincinnati. A brick and concrete power plant 75 by 125 ft. and 45 ft. high is included in the plans and a concrete dock 1,000 feet long will be built along the line of the river. The work of tearing out the old docks and machinery will be begun as soon as all of the subcontracts are awarded.

The Ohio Electric Ry. Co., will shortly commence work on its proposed improvement at Dayton, which includes the relaying of the South Main St. tracks and the extension of the suburban service.

The Chesapeake & Ohio R. R. will probably soon announce plans for the contemplated improvements on the Hocking Valley. Among these will be the enlargement and improvement of the Hocking Valley terminal facilities at Toledo, at a cost of approximately $275,000, and the construction of a connecting link of railway between the Hocking Valley at Wellston and the Chesapeake & Ohio at Huntington. A new bridge will be built at Huntington and the C. & O. will thus secure a northern outlet. The new line will tap the virgin coal fields of Symmes Creek and Waterloo, in Ohio, and will open up a large territory to development. The surveys for the new line have been made and it is said that work will be started on it during this year.

Efforts are being made to have the Cleveland Electric Ry. Co., Cleveland, extend the Superior Ave. car line to a point considerably east of its present terminus at E. 117th St. It is planned to make an extensive loop through unoccupied property and connect Superior Ave. N. E. with the Euclid line at Hayden Ave. N. E., for the purpose of sending through cars to Euclid Beach.

As briefly noted in our last issue, J. C. Carland & Co., of Toledo, O., has been awarded the contract for the last section of the Cleveland Belt Line at Cleveland. The contract covers the line between the Erie R. R. and the final section and amounts to about $1,000,000. J. C. Carland & Co. were also awarded the contract for double track work on the Big Four between Middletown and Miamisburg, O., this contract amounting to about $800,000.

The Big Miami Valley Development Co., Morgan Wamsley, President, Clevis, O., has started preliminary surveys to ascertain the amount of power that can be developed from the falls of the Big Miami River between Clevis and North Bend.

Preliminary surveys between Washington C. H. and Xenia along the proposed route of the Dayton and Xenia extension have been completed and it is believed that it will be only a short time before work is started. The construction of this extension will give another outlet for Springfield, as the Springfield & Xenia traction line is controlled by the same company that owns the Dayton & Xenia line, and when the extension of that road is finished direct cars may be run from Washington C. H.

Oklahoma Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oklahoma City & Suburban Ry Co., which proposed to build several suburban lines around Oklahoma City has filed amended articles of incorporation, increasing its capital stock from $250,000 to $400,000. The directors include Charles W. Ford, J. J. Johnson, Fred S. Combs, W. A. Haley and Richard Durrett, all of Oklahoma City.

L. J. Lampke, of New York City, has made a proposition to the business men of Perkins looking to the construction of an interurban line between Perks, Stillwater, Yale and Perry.

The Cherokee Belt & Interurban R. R. organized some two years ago has secured right-of-way and terminal facilities, and the necessary capital for construction. This road is to be 43 miles in length, connecting the Missouri, Kansas & Texas, Iron Mountain, Frisco, Santa Fe and Midland Valley, and building from Pryor Creek via Claremore and Collinsville to Skiastook. This is a belt line with interurban service. The freight is to be handled by steam locomotives, while for passenger traffic gasoline motor cars like those now used on several branches of the Missouri Pacific will be employed.

According to a statement of W. M. Bushnell, of Fort Smith, Ark., general manager of the Fort Smith & Western R. R., President Crane will be in Oklahoma within a month, and will take an overland trip over the proposed extension of the Fort Smith & Western, southwest from El Reno toward the Texas boundary. After this trip has been made the company hopes to be in a position to push the road to the southwest without any further delay.

The city of Walters has let the contract for its portion of the Wichita Falls-Oklahoma City Ry. This section of it is 10 miles long and will bring the line from Walters to the bank of Red River. The contract for the eighteen miles from Wichita Falls to Red River will be let soon.

The Lawton & Fort Sill Electric Ry. Co. is reported to have location surveys under way for its projected line through the Fort Sill Government Reservation. The company proposes to build from Lawton to Fort Sill, via Medicine Park. The line will be about 14 miles long. W. H. Pattie, Lawton, Okla., is General Manager.

Oregon Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Lane County Asset Co., of Eugene, has started surveys for its projected electric railway between Eugene and Springfield. The company is also planning several other lines for Eugene and vicinity.

Engineers are in the field and right of way is being cleared for the projected electric railway between Marshfield and North Bend. According to a statement of Major L. D. Kinney of North Bend, who is interested in the project, the line will be completed in four months.

Right-of-way is being secured by the Oregon Trunk line along its surveys south of Bend, Ore. It is understood that for approximately 30 miles land has been purchased in a 100-foot width along the Upper Deschutes, close to which river the survey follows before branching from it in a southerly direction toward Klamath.

Advices from Laidlaw state that work on the new survey for the irrigation canals, ditches and reservoir of the Oregon, Washington & Idaho Finance Company, the concern which has taken over the holdings and contracts of the Columbia Southern Irrigating Company, has begun, and will be prosecuted as fast as possible. The survey for the reservoir site will first be taken up. Sixteen hundred acres of land in the Wimer flat will be used for the reservoir site to conserve the flood waters of Tumalo creek. It is proposed to build a dam 70 ft. high and 450 ft. long. It is also proposed to construct a new feed canal to the reservoir and most of the canals and ditches will have to be reconstructed and put on proper grades. The total cost of the project will be about $450,000.

The Oregon Trunk line R. R., John F. Stevens, President, Portland, according to reports is to shortly let contracts for the extension of the line from Madras to Bend. The first 109 miles of the road are now being constructed by the Porter brothers, and the work is progressing as rapidly as men can be secured for it.

The State Desert Land Board is framing up a contract with the Evans Almirall Co., for the reclamation of 73,376 acres of land in the Lower Powder River Valley, 14 miles northeast of Baker City. The total cost of this project is estimated at $3,943,000, or about $69 per acre. The land is divided into two units, there being in one 33,800 acres to be irrigated with water from the Powder River and stored in the Thief Valley. The other

will be watered by the construction of a reservoir on Balm Creek, the supply to be diverted through a long feed canal from Eagle Creek. There will be two dams, one in the Thief Valley 110 ft. high, and the other at the Balm Creek reservoir 150 ft. high. These dams will be of concrete and earth construction. The feed canal tunnel will be over two miles long. The entire system will be constructed of concrete and steel. No open ditches will be used, these being replaced by modern reinforced concrete pipes. This is the first project under the new law and the Evans-Almirall Co. has made maps, plans and surveys that have required an expenditure of over $30,000.

The City of Portland will probably shortly take up the matter of constructing municipal docks. A bond issue of $500,000 for this purpose was authorized in 1907, but nothing has been done.

Location surveys have been started from Albany for the projected line of the Albany & Interurban Ry. to Sweet Home by way of Lebanon and the valley of the South Santiam River. It is planned to construct two electric lines to Sweet Home, one by way of Lebanon and the South Santiam Valley and the other by way of Brownsville and the Calapooia River Valley. Hugh G. Fisher, Albany, is engineer in charge of surveys.

The Oregon Trunk Line, John F. Stevens, President, Portland, Ore., now building from a point on the Columbia River, near the mouth of the Des Chutes River, south into Central Oregon, is reported to be asking for bids for the construction of a number of bridges, the most important of which will be over the Columbia River, the Celilo Canal, the Oregon Railroad & Navigation Co.'s main line and the Portage Railroad. It is said the work will cost between $1,000,000 and $1,500,000. The plans provide for a swing bridge over the canal on several fixed spans. There will be three other bridges over the Des Chutes River, one of which will be at Horseshoe Bend and another at Oxbow.

Surveys have been made through the Malheur River Valley for the Boise & Western R. R., which is to extend from Boise, Idaho, across the state of Oregon to Coos Bay. Col. C. E. S. Wood, Portland, Ore., is President.

Pennsylvania Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

The Juniata Valley Construction Co., mentioned in our last issue, has been incorporated to engage in construction work in Pennsylvania, making a specialty of the construction of electric, steam and gasoline electric railroads. A. J. Starr, H. E. Stael and B. F Godard, Huntington, Pa., are interested.

The Pittsburg & Lake Erie R. R., J. A. Atwood, Chief Engineer, Pittsburg, has been making surveys for a route from Stoneboro, Pa., to Ellwood City, via Poterville, for a cutoff and to tap the coal fields of that district.

The Borough officials of Catasauqua, have granted the Delaware, Lackawanna & Western R. R. a franchise to enter that place. To enter Catasauqua the railway would only have to build from Bath, a few miles distant. Surveys are also said to have been made for building to Allentown, three miles from Catasauqua. G. J. Ray, Hoboken, N. J., is Chief Engineer, D. L. & W. R. R.

The Reading Transit Co., Harry G. Louser, President, Lebanon, will this summer replace the 40 lb. rails on the Lebanon & Annville Street Ry., with 80 lb. rails. The line is five miles long.

The Receivers of the West Side Belt R. R. Co., of Pittsburg, are to expend $15,000 for additional yard tracks at Clairton. Henry W. McMaster is Receiver.

The Scranton Ry Co., of Scranton, proposes to lay additional tracks on Luzerne St. in that city.

Texas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

Grading work has been started five miles from Walnut Springs on the line of the Walnut Springs & Glen Rose R. R. The line will be completed to Walnut Springs and will then be built east across the Brazos River, to connect with the Santa Fe. J. H. Farr is General Manager.

The promoters of the projected interurban line from Dallas eastward have awarded the contract for grading the first four or five mile sections of Buckner Orphans' Home to E. L. Horalson, of Dallas. Dr. R. C. Buckner, Dallas, is interested.

B. F. Yoakum is reported to be negotiating for the purchase of the Texas Midland R. R. at present in operation between Paris and Ennis, with a view to making it a part of the Frisco and Trinity & Brazos Valley lines in Texas.

Surveys have been started from Gainesville for the projected line of the Gainesville, Oklahoma & Western R. R., from Gainesville to Bridgeport and thence north to points in Oklahoma. At a recent meeting of the directors in Gainesville the following officers were elected: J. C. Whaley, president; H. W. Stark, first vice president; O. F. Scott, second vice president; R. E. Thomason, secretary, and S. M. King, treasurer. F. B. Truax is the engineer.

Arrangements are under way for the beginning of construction work on the proposed line of the Penn City Terminal Ry. Co., which is to extend from Houston to Penn City, a distance of ten miles. The road is to be operated by steam with motor cars for passenger traffic. John G. Tod, Houston, is interested.

The Southern Lumber Co., of Texarkana, Tex., is said to have plans under way for the construction of a new railway line between Caddo Parish and Jefferson, Tex.

The Dimmick Construction Co., of Kansas City Mo., has been awarded the contract by the Lobo Land & Irrigation Co., for sinking 500 wells on 60,000 acres of land in El Paso County, known as the Van Horn Valley. The price of the wells depends on the depth, but it is estimated that the 500 wells will cost between $200,000 and $250,000. The 60,000 acres is to be opened for colonization. It will be divided into 20-acre tracts and on each tract will be sunk an artesian well.

The City of Austin, by a vote of 2187 to 38, has declared in favor of rebuilding the dam in the Colorado River destroyed some years ago. This work was mentioned in these columns in our March 30 and April 6 issues.

The A. M. Blodgett Construction Co., of Kansas City, Mo., is making good progress with its contract for the construction of the Galveston causeway and by the end of this month it is expected that all of the 8,500 concrete piles for the protected roadway will be finished at the end of March 2,500 of these piles had been placed. As soon as one side of the protected roadway piling is in place, the North American Dredging Co., will be ready to go ahead with its filling work, the pipe line for that purpose being now distributed over the line.

The properties of the Belton-Temple Traction Co., are to be sold at a receivers' sale at Belton on May 3, by W. G. Haag, Receiver, Temple. Arrangements for financing the line on a new and firmer basis have been made effective as soon as the receivership ends. It is probable that the bondholders will bid in the property. Street car service in Temple is to be extended to outlying territory that has built up almost solidly since the line was built and serious consideration is to be given extension of the line to Austin or Waco.

The County Commissioners at Galveston have been petitioned for the establishment of a drainage district between Dickinson and Texas City Junction on both sides of the Galveston, Houston & Henderson R. R.; about 16,000 acres of land would be affected.

The Memphis, Paris & Gulf R. R., H. C. McCluer, Chief Engineer, Nashville, Ark., is reported to have practically completed final arrangements for its extension to Texas. The whole line has been surveyed from Memphis, Tenn., via Helena, Ark., to Terrell, Tex., and cash bonuses amounted to $1,095,000 are said to have been secured, in addition to right of way and terminals. The projected line will be about 350 miles in length and will penetrate some of the richest undeveloped territory in the South. It will cross five navigable streams.

The Crosbyton & South Plains Ry. has filed its articles of incorporation at Austin. The company proposes to build a line from Spur, Tex., to Lubrock, Tex., 68 miles, and from Crosbyton to Plainview, Tex., 52 miles. Its chief stockholders are: O. L. Spencer, H. W. Coonley, J. S. Coonley, Edmund H. Bailey of Chicago, and Avery Coonley and Edward Coonley of Riverside, Ill., all of whom have large ranch interests in the territory.

J. H. Collins, Constructing Engineer, Chicago, Ill., has made a proposition to the citizens of Smithville, to build a railroad from Aransas Pass to that city. He is interested in the Aransas Pass & Northern R. R., which proposes to build from Aransas Pass to Smithville via Gonzales, Cureo, Goliad and Refugio.

D. J. Grigsley, of Dallas, who has the contract for the construction of the Temple Northwestern Ry., has opened permanent offices in the Willcox block on Avenue A at Temple. He will give personal supervision to the work, which is under full headway since the weather settled. Seventy teams are now employed on the dump and others are on the way to Temple, Gatesville and Comanche.

The Asherton & Gulf R. R., which at present extends from Artesia to Asherton, a distance of 32 miles has made a proposition to the citizens of Eagle Pass to build to that place. The road would connect Eagle Pass with the International & Great Northern and give that railroad another connection in Mexico.

Utah Notes.

FROM CORRESPONDENTS AND OTHER SOURCES

A. J. Evans of Lehi has applied to the city council of Lehi for a transfer to him of the Jesse Knight franchise for an interurban road. Mr. Knight has relinquished all applications for a franchise.

P. B. McKeon of Milford and W. H. Althoff of Salt Lake have interested Los Angeles and Eastern capitalists in a project to acquire an old reservoir site near Milford and about 10,000 acres of land. The reservoir is a part of a system constructed 18 years ago. The land reverted to the government, and the present owners believe that they can repair the reservoir for $5,000.

The Gunnison City Canal Co., of Gunnison, has been organized with a capital stock of $7,500.

The Utah Construction Co., Ogden, Utah, has been awarded the contract for constructing the railroad from Bingham Canyon to the smelters at Garfield, mentioned in our last issue. The road will be known as the Bingham & Garfield Ry., and its officials and stockholders are connected with the Utah Copper Co. The survey calls for a line of railroad 17 miles long from the mines of the Utah Copper Company at and near Bingham to the concentrating mill at Garfield, and thence to the smelter at Garfield. The maximum grade will be 2½ per cent, the maximum curvature, 6 degrees, with a small number of curves. The construction will be heavy. Three tunnels will have to be bored through the hills, each one to be of considerable length.

Virginia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Virginia & Southwestern Ry., has engineers in the field surveying from Keaker, Va., through the Cumberland Mountains into Clover Fork, making possible an extension to Harlan, Ky. J. H. McCue, Bristol, Tenn., is General Manager.

Location surveys have been completed for the 34 miles of the route of the Roanoke & Bent Mountain Ry. from Roanoke to Floyd. The remaining 13 miles are between Roanoke and Poague's Mill. The cost of the line is estimated at $1,000,000.

The Dumps Creek extension of the Carolina-Clinchfield & Ohio Ry. has been practically completed and will be opened for traffic shortly. The extension will traverse 6 mines

that are being developed by the Clinchfield Coal Corporation, at Dumps Creek, Va., which is a few miles from Dante.

Washington Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Copper River & Northwestern Ry., S. C. Hawkins, Chief Engineer, Cordova, Alaska, is to put surveying parties in the field this summer to locate a route for an extension from Chitina, Alaska, to Fairbanks, a distance of 250 miles.

The Hewes Contracting Co., has grading work well along on the interurban line which is to connect Chehalis and Centralia. Rails and other equipment have already arrived at Chehalis.

W. P. Tierney & Co., Nelson, B. C., have been awarded a contract for construction of a ten miles' extension of the Kettle Valley Lines railway (Spokane & British Columbia Ry.) up the north fork of the Kettle River. The line is now built to Lyon creek, about 30 miles from Grand Forks.

Plans are under consideration for a car line from a point near Bellevue to Redmond by way of Kirkland, a distance of approximately eight miles. The route of the road, provided suitable grades can be obtained, will be through the farming districts lying back of Bellevue, thence northward to near Northrup's Landing, thence near the shore of Lake Washington to Kirkland, and from there to Redmond. Gasoline cars will be used at first, although the plans include the ultimate electrification of the line. Surveys have been under way for some time. Capt. J. L. Anderson, Manager of the Anderson Steamboat Co., Seattle, Wash., is interested.

The Boulevard Park Ry. Co., of Spokane, has been incorporated with a capital stock of $12,000, the incorporators being Samuel Glasgow, H. W. Allen, and J. W. Oakes.

M. J. Heney, Seattle, who has the contract for the construction of the Copper River & Northwestern R. R., from Cordova to the interior of Alaska, is now using about 1,800 men in the work and by May 1 expects to have 4,000 men employed. The contract time for the completion of the road is Nov. 30.

Right-of-way being secured for the extension of the Northern Pacific from Grandview to Gibbon. This covers twelve miles through the heart of the irrigated country west and north of Prosser. It is understood the Northern Pacific intends to build a double track from Gibbon to North Yakima, making the latter point the terminus of the old Sunnyside branch instead of Toppenish Junction.

The Seattle-Tacoma Short Line Ry. Co., has filed a map of the route of its projected interurban line with the County Commissioners and made application for a new franchise to replace the one already held, which is for a different route and which expires this month. It is believed that if the new route is satisfactory to the board, another franchise will be granted and construction work commenced early in May.

The Seattle-Tacoma Short Line has been granted a 50-year franchise to operate an electric railway within the King County limits. E. J. Felt and H. A. Eastman, of Tacoma, have been awarded the contract for building the line. Practically all right of way has been secured. The line will be 29 miles long.

Residents of Charleston have voted to rebuild the city wharf at a cost of $3,500.

Bids are to be opened Apr. 22 at the office of the Project Engineer, U. S. Reclamation Service, North Yakima, for the excavation of about 40 miles of sub-laterals, in the Tieton unit of the Yakima irrigation project, Washington. These ditches, the capacity of which is less than ten second-feet, will be used for the watering of the so-called second unit of the Tieton projects, embracing 8,200 acres of land. The work has been divided in seven schedules of approximately equal value in order to make it attractive to small local contractors. The estimated cost of the entire work is about $15,000.

The Western Washington Railway & Navigation Co., C. C. Quackenbush, President, Aberdeen, has about completed the survey of the 78 miles of the road between Aberdeen and Colby, on Puget Sound, 10 miles southwest of Seattle. Most of the right of way has been secured. The road will cost $2,000,000, it is said, and will be equipped with gasoline motors for passengers cars and steam engines for freight trains. Work upon building the road may be started in the near future.

Wisconsin Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Schmidt Bros & Hill, Superior, have been awarded the contract by the Great Northern Ry. for the construction of new buildings to be erected this spring in connection with the road's big terminal project at Allouez. Included in the contract are the following: Eleven stall engine and power house; mechanical coal chute; fireproof power house; gasoline tank; seventy foot double cinder pit; storehouse and scrap bin, 30x70, 100,000 gallon water tank, and steel tower; icehouse, 20x26 feet; water piping, sewer system and fire protection system including standpipe, etc.

In addition to the McIntosh Bros. contract, mentioned in our last issue, for reconstructing the old tunnel at Tunnel City for the Chicago, Milwaukee & St. Paul, these constructors have the work of completing about 40 miles of double track on the Mississippi River Division. Both jobs are under way and are to be completed this fall. McIntosh Bros. have their offices in the Pabst Bldg., Milwaukee.

The Plum Valley R. R. Co., which surveyed a route from Plum City to Pepin and to the mouth of the Chippewa River in 1906, is taking options on a right of way for a proposed trolley line to be built in the near future over one of two routes: from Spring Valley via Eau Galle and Arkansaw to Pepin, or from Spring Valley via Rock Elm, Exile, Plum City to Pepin. The company would build over the route offering the best inducements in a financial way. H. A. Plath, Minneapolis, Minn., is interested.

The Wausau Street Ry Co., of Wausau, has purchased enough property on the Wisconsin river at Mosinee to give it the flowage rights for the development of a 21-foot head. This would give about 6,000 H. P. It is believed that steps for the development of the power will probably be taken soon.

The LaCrosse Water Power Co., W. J. Ferris, President, LaCrosse, has completed plans and submitted them to contractors for bids on the new east fork dam which is to create a 5,000,000,000 cu. ft. lake north of Hatfield, and which will help the operations of the Hatfield water power. The new dam is to be 33 feet high, 350 feet long, with six 5x6 gates in the bottom, and on a sloping side will have a dike 4,000 feet long and 33 feet high where it connects with the dam.

Canadian Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Board of Control of Toronto has decided to suport a council committee report that an engineer be engaged to assist the City Engineer in the preparation of a general plan for a subway railway service, and also that the Mayor and the City Engineer should visit several of the cities in the States, which have subway or tube railways, for the purpose of securing information as to their cost, and to endeavor to secure the services of an expert engineer, who has had charge of the construction of a subway railway.

The City of Londan, Ont., owning the London & Port Stanley Ry., is said to be considering electrifying it. At present the road is leased to the Pere Marquette.

Location work on the Alberta & Great Waterways Ry. has been practically suspended pending the hearings before the Canadian Legislature. Construction work, however, is to be proceeded with on the first 50 miles of line south of Edmonton, and contracts for clearing the way have been let. F. S. Darling, formerly with the C. P. is engineer in charge of construction.

The contract for the construction of the second line of the double track of the Canadian Pacific from Winnipeg to Portage la Prairie has been awarded to J. Hargrave & Co., of Winnipeg. This is a section 56 miles and it is the intention of the C. P. R. to have it ready for handling the wheat crop next fall. The work will entail the handling of approximately 350,000 cu. yds. of material.

M. H. MacLeod, General Manager of the Canadian Northern Ry., Winnipeg, Man., has submitted a proposition to the City Officials of Brandon, Man., by which the Canadian Northern will build a transfer track from the C. P. R. lines to its own tracks over which it will be allowed to operate a street railway. The proposition also includes the building of an industrial spur from McTavish Avenue to the C. N. R. station at the corner of Ninth and Princess Streets.

The company which is to build the two new dry docks in Canada has taken out registration papers with the State Department. The docks will be not less than 900 ft. long and 100 ft. wide, and will have a depth of 35 ft. on the sill. As previously mentioned in these columns, one of these docks will be located at Levis and the other at St. John, N. B. Both docks will be supplemented by adequate facilities for the repairing of vessels of the largest size, and it is probable that in connection with the St. John dock there will be a first-class steel shipbuilding plant. The company is composed of Harland & Wolf, of England, represented by Lord Pirrie, the Canadian Pacific by Sir Thomas Shaughnessy, the Allen Steamship Co., and McArthur, Perks & Co.

George Webster, Winnipeg, Man., has been awarded the contract for the 140 remaining miles of the Tofield-Colgary branch of the Grand Trunk Pacific. He will have his headquarters at Alix. The line is to be finished to Colgary this year.

The Canadian Pacific Ry., J. G. Sullivan, Assistant Chief Engineer, Montreal, Que., began work April 1 on its new terminals in the eastern part of Montreal near the Place Viger Station. The improvements will involve the expenditure of many millions before they are completed. They include an immense enlargement of the yards in the east end; additional trackage all the way from Dalhousie Square to Hochleaga; the construction of a continuous series of subways under Notre Dame Street, which will form a tunnel from Berry Street to Sohmer Park, and the construction of a new wing to the Place Viger Hotel, also the rearrangement and partial reconstruction of the station buildings and the construction of new freight sheds and warehouses in the vicinity of Dalhousie Square.

The Canadian Pacific Ry. will expend about $175,000 for improving its local yard at Kamloops, B. C. It is proposed to move the new station back 100 ft. from its present position and straighten out the main track. This will enable the company to lay several additional tracks, and thus provide more accommodation for cars.

The Grand Trunk R. R. has asked the city of Stratford, Ont., to build a subway, and if this is done the railway will construct a new station and shops.

The Niagara, Saint Catherines & Toronto Ry. Co., is meeting with good success in its promotion work and it is believed construction work will be started soon on its electric railroad from Saint Catherines, Ont., to Niagara-on-the-Lake, and from there to Fort Erie.

The Clyde Steamship Terminals, is planning to erect new terminals on its property in East Bay, between Market and Liberty Sts., at Jacksonville, Fla.

The supervisors of Black Bayou Drainage District of Greenville, Miss., are considering expending $8,000 to $10,000 to complete the drainage of lands along Black Bayou, in Washington County, Miss.

The Yellow Pine Mining Co. has bought the material for the narrow guage road from Jean, Nev., on the Salt Lake Route to Good Springs mining regions, and will begin building at once.

BIDS ASKED.

Bridges.

Bids are asked on following work, the notes being arranged alphabetically by states:

Denver, Colo.—Until April 16, by Charles W. Comstock, State Engineer, Denver, for the construction of a steel bridge over Blue River, 1½ miles north of Dillon.

Danville, Ind.—Until 10 a. m., April 19, by W. H. Nichols, County Auditor, for the construction of ten bridges.

Baltimore, Md.—Until 11 a. m., April 20, by B. T. Fendall, City Engineer, for constructing steel bridge over Gwynn's Falls on the Franklin Road.

Clay Center, Neb.—Until 10 a. m., April 14, by Ward K. Newcomb, County Clerk, for material and labor necessary for the construction and completion of all bridges that may be ordered in the county for one year from date of contract.

Cohasset, Minn.—Until 2 p. m., May 3, by the Town Clerk, for the construction of a steel and concrete bridge.

Meridian, Miss.—Until 8 p. m., April 15, by C. W. O'Leary, City Clerk, for constructing a concrete bridge containing 198.7 cu. yds. of concrete. W. G. Wetmore, City Engineer.

Chillicothe, O.—Until April 25, by Robert D. Alexandred, County Auditor, for labor and materials for building a reinforced concrete arch bridge over Bulls Run, about two miles from Hallsville in Colerain Township. Certified check for $100 required with bid.

Cincinnati, O.—Until noon, April 15, by the County Commissioners, Fred Dreihs, Clerk, for the following county work: Under Specification No. 19—For concrete bridge on and relocation of West Chester road south of Crescentville, Sycamore Township. Bond for $500 required with bids.

Cleveland, O.—Until noon, April 18, by A. B. Lea, Director of Public Service, 104 City Hall, for steel rods and beams for strengthening Superior viaduct.

Hamilton, O.—Until April 16, by the County Commissioners, for improving the Highman St. bridge at Hamilton by constructing new pipe railing, a protection for the lower portion of the bridge and side rails. The estimated cost is $800. L. A. Dillon is County Engineer.

Jefferson, O.—Until 1 p. m., April 19, by J. S. Matson, County Surveyor, for the construction of concrete abutments for a bridge over Rock Creek on the East and West Center Road in Rome Township.

Lima, O.—Until noon, April 14, by the Board of Control, Glen O. Wallace, Secretary, for the following work: (1) For furnishing all the labor, material and erecting a concrete bridge across the Ottawa river at the intersection of Collet St. and Shawnee Road. (2) For furnishing all labor, tools, etc., necessary for the straightening of the Ottawa river channel in the immediate neighborhood where the above bridge is to be erected.

Mt. Vernon, O.—Until 1 p. m., April 23, by Irvin Young, County Auditor, for the construction of the substructure and superstructure of the Balcom bridge in College Township.

Easton, Pa.—Until 10 a. m., April 22 by County Commissioners, for cleaning, scraping and painting county bridges.

York, Pa.—Until May 2, by the County Commissioners, for a general overhauling of the 27 iron bridges in the county, the work including two coats of paint.

Greenville, S. C.—Until April 15, by J. P. Goodman, County Supervisor, for construction of two bridges over Reedy River.

Newberry, S. C.—Until April 15, by County Commissioners, H. C. Holloway, Clerk, for constructing a steel or iron bridge to cost $3,500 over Saluda River between Kempson's Ferry and Bonknight's Ferry.

Elkins, W. Va.—Until 3 p. m., May 6, by F. A. Rowan, Clerk County Court, for the construction of a bridge over Cheat River, either at site near Bowden or near Faulkner. Bids will be received on a reinforced concrete arch or bridge, on a steel bridge with concrete or stone abutments, or a steel bridge to be placed on abutments provided by the county.

Winnipeg, Man.—Until noon, Apr. 14, by Frank Lee, Division Engineer, Canadian Pacific Ry., Winnipeg, for constructing abutments for bridge 24.4, Souris Section.

Buildings.

Bids are asked on following work, the notes being arranged alphabetically by states:

Cyrene, Ga.—Until April 15, by Rev. Z. J. Edge, president of Cyrene Institute, Cyrene, Ga., for mason, carpenter and painters' labor for a 50-room girls' dormitory; an 8-room addition to school building, and dining hall and kitchen—all frame construction. Plans may be seen at the office of the president, and may be had from the architect. Alexander Blair, Marion, Ga.

Belleville, Ill.—Until 3 p. m., May 16, by James Knox Taylor, Supervising Architect, Washington, D. C., for a plumbing and drainage system at the United States Post Office, Belleville, Ill.

Centralia, Ill.—Until 3 p. m., May 18, by James Knox Taylor, Supervising Architect, Washington, D. C., for the construction, complete (including plumbing, gas piping, heating apparatus, electric conduits and wiring) of the U. S. Post Office at Centralia, Ill.

Ottumwa, Ia.—Until 8 p. m., May 13, by James Knox Taylor, Supervising Architect, Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring and standard clock system) of the U. S. Post Office and Court House at Ottumwa, Ia.

Fort Riley, Kan.—Until 10 a. m., April 15, by Capt. W. M. Whitman, Constructing Q. M., Fort Riley, for reconstruction of artillery stable No. 76, at Fort Riley. Bid will also be entertained for the installation of the electrical work.

Catlettsburg, Ky.—Until 3 p. m., May 19, by James Knox Taylor, Supervising Architect, Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus, electric conduits and wiring), of the U. S. Post Office and Court House at Catlettsburg, Ky.

Shreveport, La.—Until 3 p. m., May 16, by James Knox Taylor, Supervising Architect, Washington, D. C., for the construction (including plumbing, gas piping, heating apparatus electric conduits and wiring and standard clock system), of the U. S. Post Office and Court House at Shreveport, La.

Fort Caswell, N. C.—Until 3 p. m., May 6, by Lieut. Wm. R. McCleary, Constructing Q. M., for construction, plumbing, heating and wiring, with fixtures, two double sets officers' quarters and one ordnance shop at this post.

Brooklyn, N. Y.—Until 11 a. m., April 18, by C. B. J. Snyder, Superintendent of School Buildings, Park Ave. and 59th St., New York, for alterations, repairs, etc., at public schools, 24, 26, 36, 43, 52, 53, 55, 68, 74, 75, 86 and 116, Borough of Brooklyn.

Brooklyn, N. Y.—Until 2:30 p. m., April 18, by Michael J. Drummond, Commissioner of Charities, foot of E. 26th St., New York, for furnishing all the labor and materials required for doing certain roofing on the Cumberland St. Hospital, Borough of Brooklyn, the City of New York. Surety required is $500.

Fort H. G. Wright, N. Y.—Until 10 a. m., May 6, by Capt. F. T. Arnold, Constructing Q. M., New London, Conn., for the construction, plumbing, heating, electric wiring and fixtures, of one double and two single company officers' quarters, one guardhouse, one ordnance shop, one coal shed, and one wagon shed, at Fort H. G. Wright, N. Y.

New York, N. Y.—Until 11 a. m., April 18, by C. B. J. Snyder, Superintendent of School Buildings, Park Ave. and 59th St., for alterations, repairs, etc., at public schools 1, 3, 8, 16, 21, 23, 29, 38, 41, 44, 106, 107, 108, 113 and 124, Borough of Manhattan, and also for alterations, repairs, etc., at Bryant High School, and public schools 1, 2, 4, 13, 14, 17, 19, 20, 72 and 76, Borough of Queens.

New York, N. Y.—Until 2:30 p. m., April 18, by Michael J. Drummond, Commissioner of Charities, foot of E. 26th St., for furnishing all the labor and materials required for alterations and repairs to building located on the Westerly end of pier at the foot of East 26th St., the City of New York. Security required is $1,000.

New York, N. Y.—Until 11 a. m., Apr. 26, by Board of Water Supply, 299 Broadway, for Contract 81—For the construction of four field office buildings and five horse sheds, in the Croton, White Plains and Hill View Divisions of the Catskill Aqueduct, in the towns of Mount Pleasant and Greenburg and the city of Yonkers, Westchester County, N. Y.

Oswego, N. Y.—Until 3 p. m., April 26, by Dr. Andrew S. Draper, Commissioner of Education, Capitol, Albany, N. Y., for construction complete, including heating, plumbing, electric work and gas-piping, for new building for State Normal School at Oswego, N. Y. Certified check for $15,600 required with bid. Franklin B. Ware, State Architect, Albany.

Rensselaer, N. Y.—Until noon, April 14, by F. A. McNeely, Secretary of the State Armory Commission at the Capitol, Albany, N. Y., for the construction of a 1-story tile and concrete house to be erected at the State Rifle Range, Rensselaer.

Ward's Island, N. Y.—Until 3 p. m., April 20, by the State Commission in Lunacy, T. E. McGarr, Secretary, Albany, N. Y., for additional medical quarters, construction, including heating, plumbing and electric work, at the Manhattan State Hospital, Ward's Island. Certified check for $1,500 required with bid. Franklin B. Ware, State Architect, Albany, N. Y.

Willard, N. Y.—Until 3 p. m., April 20, by T. E. McGarr, Secretary State Commission in Lunacy, Albany, N. Y., for water tower and piping for fire protection at the Willard State Hospital, Willard. Plans, etc., at the hospital and at office of Franklin B. Ware, State Architect, Albany. Certified check for $200 required with bid.

Warrensville, O.—Until noon, May 6, by W. H. Bubna, Clerk of the Board of Education of East View Village School District, Cuyahoga County, Ohio, at his residence on Kinsman Road in said District, or addressed to him at Warrensville, Ohio, R. F. D. No. 1, for furnishing the labor and material necessary for erecting a 4-room brick school building. George F. Hammond, Architect, at 409 Lennox Bldg., Cleveland, O.

Sewickley, Pa.—Until 3 p. m., May 14, by James Knox Taylor, Supervising Architect, Washington, D. C., for the construction, complete (including plumbing, gas piping, heating apparatus, electric conduits and wiring), of the U. S. Post Office at Sewickley, Pa.

Fort Moultrie, S. C.—Until 11 a. m., April 28, by the Constructing Q. M., Fort Moultrie, for constructing one frame artillery engineer's office and storeroom, one brick or reinforced concrete, ordnance shop, and one brick, or reinforced concrete quartermaster's storehouse at Fort Moultrie.

Beaumont, Tex.—Until noon, April 21, by Guy W. Junker, President City School Board, for the erection and completion of three brick school buildings: Millard, South End White and Averill addition, separately or collectively, including plumbing, heating, wiring and fire escapes each. Waller, Shaw & Field, Architects, Fort Worth.

Fort Bliss, Tex.—Until noon, May 4, by Capt. W. H. Waldron, Constructing Q. M., for the construction, plumbing, heating and electric wiring of field officers quarters.

Barrie, Ont.—Until noon, Apr. 18, by F. S. Baker, Architect, Traders Bank Bldg., Toronto, Ont., for all the work and material required in the erection of a new wing to be added to the Royal Victoria Hospital, Barrie.

Roads and Streets.

Bids are asked on following work, the notes being arranged alphabetically by states:

Attalla, Ala.—Until noon, April 27, by the Town Council, for the construction of 5,100 sq. yds. of artificial stone sidewalk, and 7,800 lin. ft. of combined curb and gutter of artificial stone. Certified check for $500 must accompany each bid. Hill & Campbell, Engineers, Gadsden, Ala.

Bridgeport, Conn.—Until 8 p. m., Apr. 14, by the Paving and Sewer Commission, Bernard Keating Secretary, for constructing about 1,580 sq. yds. wood block paving on Elm St., and 695 sq. yds. of brick paving on Broad St. M. F. McKenna is City Engineer.

Lake City, Fla.—Until 7:30 p. m., Apr. 25, by Board of Public Works, for constructing about five miles of cement sidewalks.

Atlanta, Ga.—Until noon, April 15, by H. L. Collier, Commissioner of Public Works, for the construction of chert or macadam pavement on portions of Waddell St., Hightower St., Wells St., Robbins St., McAfee St. and Randolph St. Certified check for $500 required with bid.

Macon, Ga.—Until noon, April 19, by Bridges Smith, Clerk of Council, for constructing 47,570 sq. yds. of pavement. Samples of paving material must accompany bid. C. C. Anderson, City Engineer.

Amboy, Ill.—Until 2 p. m., Apr. 20, by J. M. Egan, Jr., for brick paving and concrete curbing for two different improvements. Official advertisement will be found elsewhere in this issue.

Freeport, Ill.—Until 2 p. m., Apr. 21, by Board Local Improvements, for constructing 30,200 sq. yds. of brick paving, 19,890 ft. of cement curb, and 7,225 sq. yds. of macadam. J. A. R. Daniels, City Engineer. Official advertisement will be found elsewhere in this issue.

Crown Point, Ind.—Until 12 m., May 2, by Commissioners of Lake County, C. A. Johnson, Auditor, for the construction of three gravel roads in North Township.

Greencastle, Ind.—Until 11 a. m., May 2, by D. V. Moffett, County Auditor, for the improvement of 9,165 ft. of gravel road in Jackson and Floyd Townships.

Jeffersonville, Ind.—Until 11 a. m., May 23, by Commissioners of Clark, Scott and Jeffersonville Counties, Peter Nachand, Auditor of Clark County, for the construction of a gravel road.

Kokomo, Ind.—Until 2 p. m., May 3, by Commissioners of Howard County, A. B. Easterling, Auditor, for the construction of gravel roads, in Harrison and Liberty Townships.

Marion, Ind.—Until May 3, by A. G. Stout, County Auditor, for the construction of two stone roads.

Mishawaka, Ind.—Until May 2, by this city, J. W. Haverly, City Engineer, for constructing 4,750 sq. yds. of pavement on 5-in. concrete foundation on Mill St., from 2d St. to Lake Shore and Michigan Southern Ry. Bids will be received on brick, asphalt bitulithic and creosoted wood block.

Wabash, Ind.—Until 10 a. m., May 3, by J. P. Noftzger, County Auditor, for the construction of two macadamized roads in Noble Township

Wabash, Ind.—Until 10 a. m., May 3, by J. P. Noftzger, County Auditor, for the construction of a gravel road in Waltz Township.

Wabash, Ind.—Until 10 a. m., May 3, by J. P. Noftzger, County Auditor, for the construction of two gravel roads in Lagro Township.

Wabash, Ind.—Until 1 p. m., Apr. 23, by J. P. Noftzger, County Auditor, for construction of a gravel road on line between Wabash and Grant Counties.

Havre, Mont.—Until May 2, by James Holland, City Clerk, for constructing about 37,900 sq. ft. of cement walks.

Sikeston, Mo.—Until 7 p. m., May 3, for macadamizing one mile of the Benton and Sikeston Road at Sikeston. M. S. Murray, Sikeston, is the Engineer.

Should Contractors Be Required to Guarantee Standard Pavements? Is Not "Mill Inspection" of Paving Materials a Preferable Solution of the Problem.

The first question is not novel, for a good many city engineers have come to the conclusion that most classes of pavements require no guarantee. However, the question is again raised by the action of a committee of the Organization of City Officials for Standardizing Paving Specifications. The report of this committee appeared in our issue of March 23 and we note that a guarantee clause is recommended for all classes of pavements.

The committee divides pavements into two general classes, the first being composed in part of "materials of a perishable nature" or pavements requiring special equipment to lay and maintain, or pavements of a proprietary nature; the second class is composed of "materials more durable in character," such as stone block, brick, or "well established Portland cement concrete pavements."

In passing it might well be asked what is meant by a "well established" concrete pavement. Certainly nearly every other class of city pavement is better established than concrete, for the latter is comparatively new in this country, and except on streets of light traffic can hardly be said to be "established" at all.

It is not our purpose at present to discuss this recommended division of pavements into two more or less arbitrary classes, the first of which is to have a five year guarantee, and the second, a one year guarantee. The question that overshadows any such classification of pavements is whether any guarantee at all should be required. It is our opinion that a much more economic method of securing a durable pavement is available than exists in the method of exacting a contractor's guarantee. We are speaking now not of new types of pavements but of what may be termed the standard types—asphalt, bitulithic or bituminous macadam, brick, stone block, creosoted wood block, and macadam.

Few engineers will contend that the original reason for requiring a guarantee on any of these forms of pavement exists now—namely: ignorance on the part of engineers as to satisfactory methods of testing and inspecting. Although it may be true that most engineers have no deep knowledge of the chemical technology of asphalts and bitumens, still it can be no longer contended that consulting experts are not available. It follows therefore that highway engineers can employ such experts to test bitumens, just as railway engineers employ steel experts to inspect steel rails. In like manner creosoting can and should be tested by "mill inspection"—to draw a term from structural engineering.

The chief reason for requiring a pavement guarantee is the present high cost of maintaining a corps of expert inspectors and testers to pass upon the suitability of the materials. In small cities this is almost out of the question, and even in comparatively large cities it is often doubtful whether it pays to have such a staff of experts unless the amount of pavement laid annually is very large. We have indicated above what we believe to be the economic solution of this problem—namely: "mill inspection." In brief, our plan is this: Let this new organization of city engineers agree to act as a body in selecting experts to inspect and test paving materials, such experts to be permanently located at all the larger centers of production or distribution of paving materials. For example, at any large plant engaged in the manufacture of creosoted wood block one or more testing experts would be permanently located. These experts would determine whether the blocks were being treated with the specified amount and quality of creosote and whether the wood was of the kind required. Payment for such inspection services could be made on the basis of the square yard, precisely as mill inspection of steel is paid for by the ton.

In a similar manner bitumens, brick, etc., could be inspected at or near the points of production or distribution, and at a cost that would be nominal.

We can conceive of no other plan that would so speedily lead to standardization of paving materials as this plan of "mill inspection." It has worked wonders in the realm of steel and it will evolve equal wonders in the realms of paving materials.

We believe that few engineers will doubt their ability to secure a durable pavement by proper engineering inspection in the city where it is laid, if they can be sure of receiving suitable materials for the pavement. The questions of proper mixtures and of proper manipulation of materials are relatively simple and can be easily inspected in any city. The great bugbear is and always has been the inspection of the materials. Give any engineer a rock equal to the traps found on the Hudson River and he will make you a durable macadam road. Give any engineer an asphaltic oil equal to that from the Sunset district of California and he will make you a durable dust proof coat for your macadam. Give any engineer a wood block uniformly impregnated with sufficient creosote and he will have no trouble in securing a wood pavement of lasting quality. Why then not strike at the very root of the difficulty? Should it be answered that human knowledge of asphalts, for example, is still too incomplete to enable us to specify and test them properly, our reply is that we are then asking the blind to lead the blind when we require a contractor's guarantee of an asphalt pavement. No, we are convinced that it is not a lack of knowledge of the subject that is now perpetuating the precedent of requiring guarantees, but rather the cost of maintaining laboratories and experts in each city to test the materials. If this is the fundamental reason, then it behooves us to consider the plan of "mill inspection."

As the aim of all engineering is economy of production and operation, let us consider for a moment whether it does not cost far more to secure proper street materials by requiring contractors' guarantees than it would cost to secure them by "mill inspection."

A five year guarantee must usually be accompanied by a bond. Latterly, however, engineers have come to regard such bonds as being the sources of so many law suits that they have pretty generally recommended retaing 10 per cent of the contract price of the pavement during the guarantee period. The effect has unquestionably been to increase the contract price of pavements by 5 to 10 per cent. Asking a small contractor to wait five years for his 10 per cent is practically equivalent to asking him to wait forever. It represents all or nearly all of his ordinary profits—his salary for superintendence. Let us who are engineers ask ourselves what we would do if required to wait five years for our salaries. We simply could not do it at all, and that is precisely the position of the small contractor. He is either driven out of business by the firms of large means or he increases his price on the pavement. If he is driven out, then the large firms, finding little competition, raise their prices accordingly. In any event the result is the same.

Steel rails are inspected for less than 1 per cent of their mill price. We see no reason why paving materials may not be inspected and tested for considerably less than 1 per cent of their first cost, provided the work is done at the "mill," according to the plan above outlined. The cost of testing cement in small field laboratories is about 3 cts. per barrel, say 2 per cent of its first cost. In mill laboratories it is considerably lower, probably not more than 1 per cent of the first cost for both physical and chemical tests.

Clearly then the present system of guaranteeing pavements is far more expensive to the community than a system of "mill inspection" would be, and, in the end, the result is not at all satisfactory. Only the other day we received a letter from a highway engineer in charge of work in one of our large cities, in which he stated that one of the reasons why he advocated a municipally operated repair plant was because contractors failed to maintain their pavements properly under their guarantees. While we fail to see soundness in this reason for a municipally operated plant, we do know that the conditions confronting this city engineer are precisely as stated by him—namely: that the guarantee clauses are practically worthless. If no such clauses existed, then separate contracts for maintenance could be and should be let.

Finally, out of the experience of one of the editors of this journal in the paving contracting field, another serious objection to the guarantee system may be cited. It is this: No contractor can be sure that a change of city administration may not bring in a swarm of grafting politicians who dispossess an honest city engineer and appoint in his place a man who will "take the hide off" every contractor who has pavements under guarantee, unless a contribution to the graft fund is forthcoming. This is one of the potent reasons why many paving contractors fear to put

Copyright 1910, by the Myron C. Clark Publishing Co. All Rights of Republication Reserved.

in any bid at all in a strange city, if guarantees are required. It is also one of the reasons for high bids in many cities where grafting now exists. We need scarcely more than mention this phase of the matter, for every city engineer is aware of the extreme difficulty of drawing a maintenance clause that can not be used as a club over a contractor's head, if an unscrupulous person should have the power so to use it.

We strongly urge the Organization of City Engineers to take up the subject of "mill inspection," or central cooperative inspection of paving materials as offering the truly economic solution of this important problem.

Maintenance Work on the New York State Highways by the Patrol System.

The work of maintaining and repairing New York highways which have been improved under state aid is in charge of a special bureau of the State Highway Commission. This bureau conducts the work of maintenance and repair in three ways: by contract, where the work is of sufficient size; through the county and town superintendents, in cases where the repairs are of such a nature that it is impracticable to provide a contract for the work; and by a system of patrol which is provided for every road which has been improved by state aid.

The organization of the bureau of maintenance and repairs consists of a first deputy, who reports directly to the commission. Under the first deputy are six assistants or superintendents of repair who have charge of the maintenance and repair work in the six divisions into which the state has been divided. Under these superintendents are highway inspectors who have charge of certain sections covering one or two counties, each inspector having the supervision of from 60 to 100 miles of improved highway. Next under the inspector come the patrolmen, who have the care of approximately five miles of highway. The highway inspectors make regular visits to these patrolmen, instructing them in the matter of maintaining the highways, see that they are provided with material, and superintend and direct their work. The work of the patrolmen under the highway inspector not only includes the repairing of small holes, cleaning of ditches and waterways, etc., but also the elimination of ruts and the preventing of ravel by the application of a wearing coat on the roads from time to time. The patrolmen supply themselves with a horse and cart and necessary small tools for their work, and are constantly on their patrols from 8 a. m. until 5 p. m. This allows them an hour for coming to and going from their work. Under the direction of the highway inspector they are constantly employed between these hours doing such work as may be necessary to preserve and care for the highways under their charge. There is no question, states the last annual report of the Highway Commission, from which these notes have been taken, but what this constant care and supervision and attention to the small things greatly increases the life of macadamized highways. It is also intended to apply this system to the asphalt macadam roads constructed in 1909, and it is believed that the patrolmen will be able to cover a greater length of roadway so improved. It is proposed to outfit these patrolmen with a small portable heating outfit in which asphaltic oils can be heated, and it will be his duty to cover his patrol with this outfit and clean out any holes and depressions that may occur, fill them with the oil and three-quarter stone or screenings, and that any ruts which may occur from time to time in the same manner. In the spring and fall of the year, when macadam does not need as much attention as during the dry months of the summer, patrolmen are employed advantageously in the construction or renewal of guard rail or painting of the same. The patrolmen are employed practically nine months in the year, and the highway inspectors in charge of sections are employed for twelve months in the year.

Concrete and Reinforced Concrete Section

Note: This section is devoted to methods and cost of constructing concrete and reinforced concrete structures. It will cover the selection, testing and proportioning of concrete materials; laboratory tests of concrete; concrete mixing, transportation and placing; fabrication and placing of reinforcement, and form construction and erection. It will also contain articles on new and interesting developments in the design of reinforced concrete.

Special Forms for and Methods of Constructing Weber Concrete Chimneys.*

We are now building two different types of chimneys, which, though identical in principle, differ greatly in details of construction and appearance. Both types are equally well adapted for their purpose, but each has certain advantages over the other which makes it preferable under special conditions.

The "cylindrical" chimney is built with vertical outlines and a uniform inside diameter throughout. This chimney as a rule has double walls for the lower part of the shaft, with a 4-in. air space between the walls. The upper part, from two-thirds to one-half of the entire height of the shaft, is built with a single wall of uniform thickness throughout. Where the two parts connect a collar or offset is visible on the outside of the chimney.

The "coniform" chimney is the latest type of construction. The coniform chimney is built with tapering outlines, and because of its greater initial stability and the resultant saving in reinforcing steel can be built at a somewhat reduced cost. The standard taper for the chimney is 1:56 and therefore the outside diameter increases 1 ft. for every 28 ft. of height. The thickness of the wall at the top is 4 ins. for chimneys up to 8 ft. inside diameter. Chimneys over 8 ft. and up to 12 ft. inside diameter have a wall thickness of 5 ins. at the top; chimneys over 12 ft. and up to 18 ft. 6 ins. and chimneys over 18 ft. have 7 ins. of wall thickness at the top. The thickness of wall increases 1 in. for every 28 ft. in height and therefore the center of gravity of the chimney is considerably lower than the cylindrical chimney.

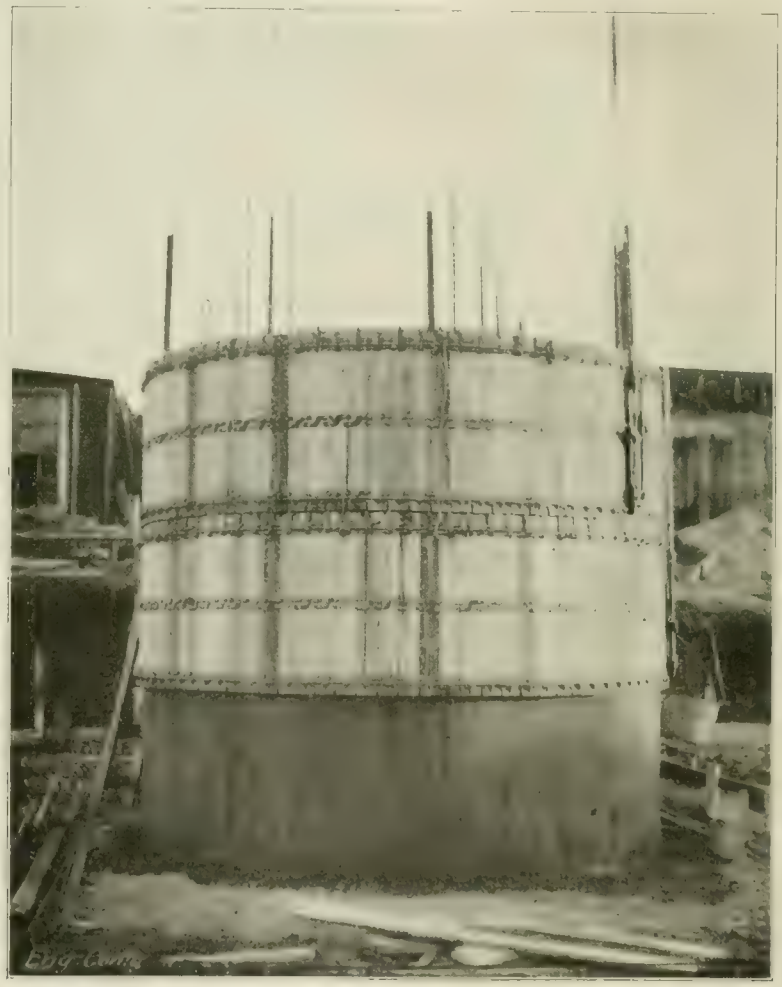

Fig. 1—View Showing Special Forms for Constructing Concrete Chimneys.

Each system has decided advantages of its own, and the conditions that have to be met will determine which is to be preferred.

The cylindrical chimney is almost exclusively used where the greatest possible saving of space is necessary, as, for instance, in places where the chimney is built inside of a building, between batteries of boilers or in congested city districts.

The coniform chimney is to be desired wherever the necessary space can be obtained. This chimney is somewhat cheaper than a cylindrical one, and also has the advantage of a more pleasing appearance. For high temperatures the chimney is partly lined with firebrick. Although concrete lining is undoubtedly better than firebrick lining, the cost of the former is made too expensive by the difficulty of hand-

*Rearranged from a paper by Carl Weber before the American Society of Engineering Contractors.

ling the complicated air space forms in a tapering chimney.

Materials of Construction and Forms.—The materials of construction are Portland cement, sand, and crushed stone or gravel, as for any other reinforced concrete work. The nature of the materials and the proportions of the concrete must naturally differ greatly to satisfy the varied purposes for which chimneys are erected, and it is hardly possible to give any strict rules for he composition of the concrete. Before deciding on the concrete mixture for a chimney, I always obtain samples of the local sand, stone, and gravel; and after carefully determining the percentage of voids in these materials I specify the proportions in accordance with the design and purpose of the chimney.

Tall and slender chimneys, with a diameter of about 1/25 to 1/40 of the total height, are subject to high bending stresses, and therefore a tough concrete of high crushing resistance is needed, while in sort and stubby chimneys, with a diameter of 1/10 to 1/20 of the height, a leaner concrete will be preferable. Chimneys which are subject to excessive heat must be built of very porous concrete, especially if they are subject also to sudden changes of temperature, while chimneys for chemical works, smelters, and so on require at least a very dense inside coating. Chimneys for copper and lead smelters require special protection against the actions of the sulphuric and arsenic gases and acids; and very often a chimney will require a special outside treatment for local reasons.

For chimneys built near the ocean, where the damp salt air is a factor to be considered, it is advisable to place the reinforcement well in the center of the wall, in order to prevent any possibility of rust streaks which mar the appearance and are very undesirable. Chimneys which are within the zone of other chimneys emitting poisonous gases will often require outside acid proofing. The kind of fuel used, whether hard or soft coal, wood, peat, oil, or local refuse, is frequently a very important factor to be reckoned with, and climatic conditions must not be overlooked.

If several flues enter into one chimney the necessary baffle walls must be provided for, and these walls must also be properly reinforced. Very often dust collectors, economizers, and so on have to be built in connection with the chimney, and care must be taken to have the necessary expansion joints supplied in these structures.

There is no other branch of reinforced concrete construction that requires such a varied and practical knowledge of the materials and the chemical and physical factors entering into the problem as chimney construction. There is no guess work in chimney construction and every failure can be traced directly and surely to ignorance or carelessness.

The method of construction of concrete chimneys is interesting and unique. The forms consist of a number of loosely connected wooden units provided with cast iron lugs which interlock and automatically secure the forms perfectly alined in a true circle.

The form units are held together by means of light steel ropes, which, acting like the hoops of a barrel, are uniformly tightened by a rope stretcher attached to one of the standard units. By means of these rope stretchers the forms can be set and released, tightened and loosened, from the working platform inside of the chimney without the use of an outside scaffold.

Figures 1 and 2 show details of the unit form system and the construction of the outside forms can clearly be seen in these pictures. The units are preferably all of even width, each representing a multiple of the figure π (3.1416), and the addition or removal of one of the units changes the diameter of the form correspondingly. Therefore any desired diameter can be built with these forms. For tapering structures a certain number of reducer units are placed evenly around in the form (see the dark staves in the pictures). These reducers are slightly tapered and together they reduce the upper diameter of the form ring, so that in the next ring above a smaller number of units are required. Of course any desired taper can be made.

The proportion of the taper is fixed in the reducer units, and therefore no reducers must be removed from the form by resetting the same, as otherwise a change in the taper would be the result.

This form system is equally valuable for any other kind of continuous construction, and is much used for the construction of water and oil reservoirs, tanks, towers, grain elevators, silos, and so on. Frequently a set of forms is rented to other contractors, but of course, on account of the patent questions involved they cannot be sold.

In chimney construction the forms are raised each day with the progress of the work. The single units are light and are so arranged that they cannot slip after the forms are opened. They are easily lifted piece by piece and as easily set again for concreting. The working platform, on which the workmen stand, forms a part of the inner forms, and all work, with the exception of the mixing of the concrete, which is done at the base of the chimney, is carried on from these working platforms just as safely several hundred feet up in the air as it possibly could be done on the level ground. The forms are extremely strong, in spite of their lightness, and there has never been a single case of an accident resulting from their use.

A light scaffolding is erected inside of the chimney merely for the purpose of carrying a ladder to the working platform. For chimneys up to 100 ft. high, scaffold and ladder have frequently been omitted, the workmen using a hoist rope to go up and down.

The same set of forms can be used for chimneys of all sizes, from 2 ft. 6 ins. in diameter up to 50 ft., and although a new set of forms is very expensive, the cost per chimney is reduced to a minimum. Because of the great care with which these forms are made, and the attention given to their preservation, an absolutely even surface of the concrete is produced, and any special outside finishing is resorted to only in very rare instances. Another important feature of these forms is that they can be used without any change on straight or tapered work and also on square, octagonal, and round structures with equally good results.

Steel forms have also been tried for chimney construction, but they have proved an absolute failure. The concrete adheres to the forms and the work produced is very rough. Greasing or oiling the forms is of no avail, because the first bucket full of concrete put into forms or the slightest tamping or spading destroys the film of oil or grease, causes unsightly streaks of oil, rust, or efflorescence to appear, and produces a weakening of the outer surface of the concrete. In frosty weather, the use of steel forms is an impossibility. Another serious objection is that these forms are easily buckled by handling and shipping and can never be adjusted again to a true circle. Every time the metal forms are raised an offset is visible in the work and these offsets can never be removed satisfactorily. A poor quality of work is the inevitable result of the use of steel forms and although large sums have been spent on experiments and schemes to perfect them, they must be abandoned for chimney construction.

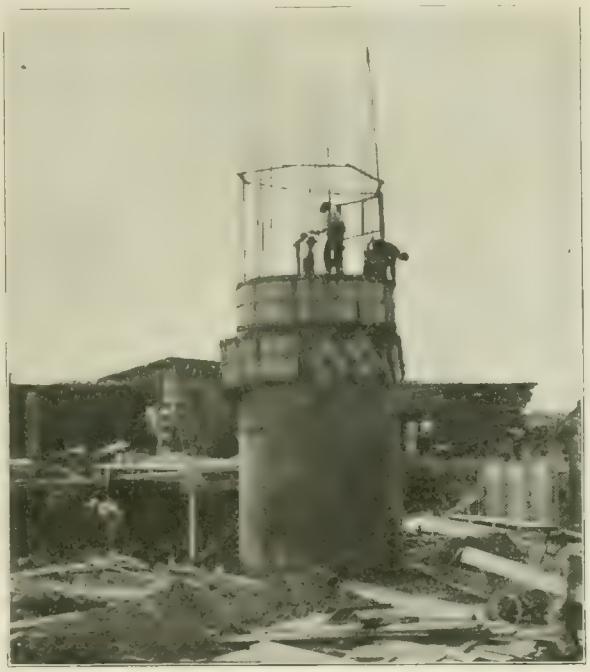

Fig. 2—View Showing Methods of Handling Forms for Concrete Chimney Construction.

The mixing of the concrete for chimney work is, as a rule, done by hand. Only a small amount of concrete is needed each day, and only a few hours of concrete mixing are required. The concrete must be mixed immediately before using, and all concrete which has been mixed over 30 mins. before being put into the forms should be thrown away.

The concrete is hoisted to the working platform in small quantities, and common water buckets are generally used for this purpose. On smaller chimneys the men who mix the concrete do the hoisting by hand, while on larger structures horse hoists or engines are used for this purpose.

There is very seldom any special outside finish required for the concrete walls. The perfect alinement which is at all times maintained in the unit forms produces very slight form marks, and as these are absolutely uniform they add to rather than detract from the beauty of the work. Patch work should never be permitted on a chimney; it only lasts a short time and the structure afterwards looks worse than before. A cement wash is often applied to the outside surfaces and although in a carefully constructed chimney there is no necessity for it, such cement wash, if carefully used on a moist concrete surface, will produce a uniform color. Whether, however, an absolutely uniform color on a large chimney is desirable or not from an artistic standpoint is another question. I believe that the only real objectionable feature in concrete work is the monotony of the gray color that characterizes the work and that the presence of correct form marks and a slight variation in the color scheme greatly increases the artistic effect. I am opposed to patching and painting concrete structures, especially as a means to cover up poor workmanship. The forms should leave the concrete surface without blemish, and if occasionally here and there a rough spot needs to be retouched to harmonize with the general

appearance of the structure, the experienced builder will certainly know what to do without using plaster or paint.

Advantages and Cost of Concrete Chimneys.—The general advances of the concrete chimney over any other type of construction are the following:

(1) It is monolithic; one solid single piece of concrete stone from bottom to top. The atmosphere, which in course of time disintegrates brick or natural stone, only adds to the strength and beauty of good concrete.

(2) It is absolutely air tight; the flue is almost perfectly smooth and therefore the chimney has a higher working capacity than any other.

(3) It can be erected in a shorter time than a brick or steel chimney. The materials used in its construction—cement, sand, and steel bars—are obtainable in any locality upon short notice and work can be started almost immediately after receipt of order.

(4) It can be built on a much smaller area than a brick or self supporting steel chimney—a point of the highest importance to a modern steam plant. A concrete chimney needs about one-half the area of a self supporting steel chimney and from one-third to one-fourth the area of a brick chimney of the same diameter and height.

(5) It is light, even lighter than a self supporting steel chimney, including lining and foundation. This is of the highest importance where the natural ground has a limited carrying capacity. The weight of a concrete chimney is from one-third to one-fifth that of a brick chimney, and therefore a good deal of money can be saved in many cases for pile driving and other foundation work.

(6) It resists the influences of the chimney gases and heat better than all others. Selected materials, strong steel reinforcement, and the monolithic nature of the chimney make it capable of resisting a continuous heat up to 1,500 degrees Fahrenheit, without injury. Concrete is one of the best fire resisting building materials known. Cement stands the test where brick and steel are completely destroyed.

(7) It is more attractive in appearance than either a brick or steel chimney. The light gray color, in connection with the elegant and graceful outlines, produces an artistic effect wholly foreign to a brick or steel chimney.

The cost depends of course almost entirely upon local conditions, local prices for cement, steel, sand, and so on, and therefore any rough and ready rules for making estimates would be worthless.

As compared with others, the concrete chimney will as a rule show a generous saving in cost, in all construction over 75 ft. high and over 3 ft. inside diameter. Even on smaller sizes this will very often hold true.

Cost of Abutment Masonry and Slope Paving for Highway Bridge Foundations Illinois and Mississippi Canal.*

To carry highways across the Illinois & Mississippi Canal required 67 bridges. Except for one swing bridge, three lift bridges and two special bridges at locks, these bridges are fixed truss bridges on concrete abutments. Three types of structure were employed.

(1) On the eastern section generally the abutments were U shaped and the superstructures were pony Warren trusses of 100-ft. spans and 14-ft. clear roadway.

(2) On the western section generally the abutments were wing abutments and the superstructures were 110-ft. Pratt trusses. The wing abutments were 23 ft. long and 16 ft. high, with 18-ft. wings at an angle of 30°.

(3) On the feeder canal a three-span structure carried on straight abutments and two-tower piers was employed. The main 75-ft. spans were pony Pratt trusses and the two approaches were stringer spans of 21 ft.

On the main canal the bridges had a clearance of 17 ft. over the water. On the feeder canal the clearance was reduced to 12 ft. The following data relate to the structures used on the western section of the main canal.

The wing abutments contain for each bridge (two abutments) 190 cu. yds. of natural cement concrete in the footings and 248 cu. yds. of Portland cement concrete in the abutments proper. The parapets are oak timbers 12 ins. wide and 22 ft. long. The slopes of the canal in front of each abutment for a distance of from 60 to 120 ft. are paved with hand laid rubble for the first bridges built and with concrete about 10 ins. thick for the bridges built later.

The steel superstructures were designed to carry a live load of 100 lbs. per sq. ft. or an engine load of 8 tons on axles 7 ft. c. to c. The trusses are 110-ft. spans, 20 ft. high and spaced 19 ft. 1 in c. to c., having a clearance of 16½ ft. between guards. These guards are 6x8 in. pine raised 3 ins. above the floor and having on the wearing side 3x3x¼-in. angles.

The embankment approaches are 21 ft. wide on top, with side slopes of 1 on 1½ and with grades running from 3 to 6 per cent. The roadways are surfaced with gravel or crushed rock and have board railings extending from bridges to foot of slope.

The costs given here relate to the substructure, that is, the concrete abutments and footings and the adjacent slope paving. The forms for the abutments were simple, consisting of opposite posts tied through the walls at bottom and mid height with bolts and at the top above the wall with 3x12-in. plank with short knee braces. The concrete was mixed in a Smith mixer charged by one-horse dump carts and was hauled to the work in cars and hoisted by horse elevator and dumped into the forms.

The following is the detailed cost of the substructure for highway bridge No. 34. Excavation and back fill cost as follows:

	Total	Per cu. yd
Excavation (576.6 cu. yds.):		
Labor	$151.52	.....
Stakes	3.00	.....
Total	$154.52	$0.268
Back fill (256.4 cu. yds.):		
Labor	$ 55.88	$0.220

There were 190 cu. yds. of natural cement concrete in the footings which cost as follows:

	Total.	Per cu. yd.
Concrete Materials:		
Cement	$ 208.80	$1.099
Crushed stone	289.02	1.521
Sand	113.00	0.594
Total	$ 610.82	$3.214
Receiving Concrete Materials:		
Hauling cement	$ 23.50	$0.124
Unloading cement	2.65	0.014
Hauling crushed stone	94.98	0.499
Freight on gravel	7.50	0.039
Total	$ 128.58	$0.676
Labor mixing and placing	218.39	1.149
Grand total	$ 955.79	$5.039
Form Materials:		
Lumber	$ 28.50	$0.150
Stakes	3.00	0.016
Hardware	1.65	0.008
Total	$ 33.15	$0.174
Form Labor:		
Hauling and unloading lumber	$ 3.70	$0.019
Labor constructing	17.16	0.090
Labor wrecking	2.00	0.011
Total	$ 22.86	$0.120
Grand total	56.01	0.294
Miscellaneous:		
Labor receiving materials	$ 15.48	$0.081
Miscellaneous labor	8.72	0.046
Total	$ 24.20	$0.127
Grand total	1,038.00	5.460

The cost of 248 cu. yds. of Portland cement concrete in the abutments proper was as follows:

	Total.	Per cu. yd.
Concrete Materials:		
Cement	$ [illegible]	$ [illegible]
Crushed stone	378.00	1.524
Sand	[illegible]	[illegible]
Total	$ [illegible]	$ [illegible]
Receiving Concrete Materials:		
Hauling cement	$ [illegible]	$ [illegible]
Unloading cement	3.40	0.013
Testing cement	29.50	0.118
Hauling crushed stone	114.78	0.462
Freight on gravel	9.50	0.033
Total	$ 181.05	$0.727
Concrete labor	265.67	1.071
Running mixer labor	22.00	0.081
Total	$ [illegible]	$ [illegible]
Grand total	$1,478.56	$5.952
Form Materials:		
Lumber	$ 59.50	$0.239
Hardware	11.35	0.045
Total	$ 70.58	$0.284
Form Labor:		
Hauling and unloading lumber	$ 50.82	$0.205
Labor constructing	119.86	0.483
Labor wrecking	15.75	0.063
Total	$ 186.43	$0.751
Grand total, forms	257.28	1.035
Miscellaneous:		
Labor receiving materials	$ 19.39	$0.078
Miscellaneous labor	15.42	0.062
Coal	19.19	0.076
Total	$ 54.00	$0.216
Grand total	$1,789.84	$7.217

The cost of 313 sq. yds. of rubble stone paving was as follows:

Item.	Total.	Per sq. yd.
Rubble stone	$406.78	$1.299
Hauling rubble stone	83.44	0.266
Labor paving	180.32	0.576
Labor receiving material	13.94	0.044
Miscellaneous labor	7.86	0.025
Total	$692.34	$2.210

The following expenses were charged against the whole work:

Engineering and inspection	$153.43
Traveling	4.08
Chicago office expenses	69.84
Total	$227.35

The grand total cost of the whole work was $3,957.93.

The work described was done by day labor and the wages paid were about as follows:

Carpenters, per day	$2.50
Laborers, per day	1.75
Teamsters with team	3.00

An 8-hour day was worked.

In the following Table I are given the masonry and slope paving costs of 20 other bridges of the same type as that described.

TABLE I.

	National cement. Concrete.		Portland cement. Concrete.		Slope Paving.	
No. of bridge.	No. cu. yds.	Per cu. yd.	No. cu. yds.	Per cu. yd.	No. sq. yds.	Per sq. yd.

Forms of Concrete Pile Construction and a Statement of the Advantages and Disadvantages of Concrete Piles.*

Historical.—Concrete piles may be divided into two general classes, "cast and driven" and "cast in place." The "cast and driven" type are always of reinforced concrete, are molded prior to being placed in the ground, and are driven like wooden piles. "Cast in place" piles are usually, though not necessarily, without reinforcement, and the pile hole is made artificially and afterward filled with concrete.

The first concrete piles were made in France by Mr. Hennebique in 1896, and were made of the cast and driven type. During the following decade this general type was developed by different engineers, and is now more generally used in Europe than any other. In the United States the Gilbreth (patented in 1908), Chenoweth (patented in 1904), and Raymond (patented in 1896) are the best known varieties of cast and driven piles.

In 1890 A. A. Raymond of Chicago, Ill., conceived the idea of a cast in place concrete pile, a further development of the caisson principle. His first patents were issued in 1896, and the first piles driven in 1901. The

*Compiled from data collected by Fred W. Honens, M. Am. Soc. C. E., U. S. Engineer's Office, Kansas City, Mo.

*Extracted from the report of the Committee on Wooden Bridges and Trestles, American Railway Engineering and Maintenance of Way Association.

Simplex pile, patented in the United States in 1903, is of the cast in place type, though differing from the Raymond in method of construction. These two systems have thus far been used in this country to a much greater extent than cast and driven piles, though owing to our comparatively recent development in concrete construction, our total use of concrete piles is less than the European. Prior to 1900 practically no concrete piles had been used in the United States .

Cast and Driven Types.—The chief objection to cast and driven concrete piles has been based upon the possibility of injury to the reinforced concrete during driving. Most of the systems in vogue care for this by jetting the piles or by the use of a special driving cap designed to protect the head of the piles. The patents covering these various systems refer principally to the driving caps, the arrangement of the reinforcement, provision for jetting, method of molding, and the shape of the pile itself. All of the items entering into the manufacture and placing of cast and driven piles may be varied to suit the local conditions.

The Gilbreth pile is a corrugated, tapering concrete pile, reinforced with Clinton electrically welded fabric of ⅜-in. wires 3 ins. on centers longitudinally, and ⅛-in. wires 12 ins. on centers transversely, or other enforcement of suitable design. The piles are made of any shape desired, but are usually octagonal, tapering from 16 ins. in diameter at the butt to 11 ins. at the tip, with corrugations running the entire length. In case the piles are intended to project above the ground, the corrugations may be stopped at the ground level. The taper is designed to develop the bearing power of the soil throughout the entire length and the corrugations are added to form outlets for the water from the jet. A hole is made through the center of the pile for jetting. The piles are cast horizontally in wooden forms and allowed to set for various periods; in some instances they have been driven after 7 days. They are handled by an ordinary pile driver and jetted into place, using a 2-in. jet, flowing through the hole in the center of the pile. The weight of the hammer resting on the driving cap helps to force the pile into place. The special driving cay consists of a steel shell with wooden blocks at each end, between which are pieces of hose and rope to form a cushion. When the pile has been jetted nearly into place the hammer and cushion cap may be hoisted, the jet removed, the cushion cap replaced, and the pile driven to the desired penetration per blow.

The Chenoweth pile is round and is made without forms by a special machine. It is reinforced with a coiled sheet of wire netting and longitudinal steel rods placed near the surface, at equal distances apart. The apparatus for rolling the pile consists of a traveling platform and the roller between which the pile is formed. The winding rod in the center is set in line with the shaft of the large spur wheel shown in In operation the steel wire netting, with the longitudinal rods attached, is spread on the platform and covered with a layer of concrete. One edge of the netting is attached to the edge of the platform and the other to the winding pipe or mandrel. The mandrel is then rotated and the netting and its covering of concrete is wound or coiled up. At the same time and as fast as the netting and concrete are coiled, the platform moves under the roll and the roll itself rotates, thus pressing the pile into shape.

To bind the roll of concrete, wires are wound around it at intervals of 6 ins. and tied. The wires are placed upon the platform beneath the mesh so that when the pile reaches the lower edge of the platform and is entirely rolled, they can be tied about the pile. The spools containing the wires are placed 4 ins. apart for the first 6 ft. of the pile from the driving end and 6 ins. apart for the remainder of its length. The pile is removed from the machine and rolled upon a car, by which it is transported to a platform, where the point is formed, and on which it is allowed to remain until hardened.

The driving cap is a steel cylinder, with a diaphragm in the center. The lower end of the cylinder fits on the head of the pile, and the upper end receives the wooden driving block. A cushion of rope is used between the head of the pile and the diaphragm, while a cushion of sawdust is placed between the diaphragm and the driving block.

The piles are driven with an ordinary pile driver and an extra heavy hammer. The concrete used is generally a 1:2:3 mixture of Portland cement, sand, and screenings or broken stone.

Cast in Place Piles.—The Raymond system is an economic way of placing caissons. A heavy mandrel, called a core, is surrounded by a casing of sheet steel and the whole is driven into the ground by means of a steam hammer. When the desired depth is reached the core is collapsed and withdrawn from the hole, leaving the steel shell in the ground as a form for the pile; the concrete is then shoveled into the hole and the pile is complete. The sheet steel shell is made havy enough to withstand the pressure of the earth along the sides of the hole, and protects the concrete from mixture with the surrounding earth. These shells are usually made in 8-ft. sections, and each section laps the other 6 ins. The point section is first placed on the core, then the next above, etc., until the core is covered. This brings the lap on the outside and each section is pushed into place as the driving proceeds.

After the core is withdrawn and before placing the concrete, the interior of the shell can be inspected, by means of an electric light, by reflected light from a mirror, or by the light reflected from the surface of water thrown into the hole. The 20-ft., 25-ft., and 30-ft. cores taper from a 6-in. point to a 20-in. head, the 35-ft. from an 8-in. point to a 20-in. head, and the 40-ft. from a 10-in. point to an 18-in. head. This is a greater taper than is found in any other type of concrete pile and is as great as practical limitations will permit. The diameter of the head and the taper are designed to provide a large bearing surface for the concrete footings, a large surface area for frictional bearing, and a maximum compression of the earth surrounding the pile. While the Raymond pile is rarely reinforced, reinforcement may be added by lowering a fabricated skeleton into the shell before the concrete is placed. Rods may also be placed by churning them through the concrete after the shell has been filled.

The Simplex system consists in driving an extra heavy iron pipe into the ground with a special point to exclude the dirt; when this pipe is driven to the proper bearing, a drop bottom bucket, filled with concrete, is lowered to the bottom of the pipe and dumped. The bucket is then removed, a heavy weight lowered into the pipe, and the pipe raised nearly to the top of the concrete, the weight being repeatedly dropped on the concrete, thus forcing it out of the end of the pipe. Another bucket of concrete is then placed in the pipe and the operation repeated until the pile is formed.

Two kinds of points are used, depending upon the character of soil through which pipe is driven. If in soft soil, a cast iron point closes the end of the pipe, while in stiff clay a pair of jaws are used. These jaws are attached by hinges to the bottom of the pipe, and automatically open to permit the concrete to flow through them as the pipe is raised. The pipes used are extra heavy steel, banded where necessary, and are made up in sections of varying lengths to suit the length of pile required.

The pipes are cylindrical and are usually 16 ins. in diameter. The only limit to the length of pile which can be driven by this method is the ability to drive and pull the pipe. In stiff, non-water bearing or clay soils, where the ground has no tendency to flow, this is the cheapest system of installing concrete piles.

Estimated Commercial Use.—After careful inquiry it is estimated that about 2,500,000 lin. ft. of cast-in-place piles are now in use in this country. No definite data in regard to the use of cast-and-driven piles could be obtained, but the quantity is believed to be less than 250,000 lin. ft.

Advantages of Concrete Piles.—Wooden piles are loaded to about 15 tons, and while many engineers think they are capable of carrying greater loads, this load represents conservative practice. The loads allowed on concrete piles vary from 25 to 50 tons each, depending upon the nature of the ground and the system used; in European practice they are loaded to 40 or 50 tons each, and there are records of piles loaded to 80 tons; the best American practice, however, limits the load to 35 tons.

To prevent decay wooden piles are cut off at low water and the foundations must be carried down to this level. The tops of concrete piles may be at any elevation desired and the depth of the footing course will be governed by the spacing of the piles and the weight of the superstructure. In this way the expensive excavation for deep footings, as well as the cost of the additional depth of footings, is saved.

Concrete piles cannot be driven as rapidly as wooden piles, but since the load per pile is greater, their use may result in a saving of both time and cost. If concrete piles are used, no delay is occasioned by waiting for the arrival of the piles; wooden piles are difficult to obtain in certain parts of the country, but sand, stone and cement are generally available. There is no reason why concrete should vary in quality, while it is becoming more and more difficult to obtain wooden piles of a standard grade.

A wooden pile rots if alternately wet and dry and is subject to attack by the teredo and other wood borers when placed in salt water. The elevation of ground water fixes the point of cut off, but the building of deeper sewers in the neighborhood may lower the ground water level, and when this occurs wooden piles are subject to decay.

Possible Disadvantages of Concrete Piles.—The argument most frequently urged against concrete piles is their cost. The cost per linear foot is certainly greater for a concrete pile than for one of wood, but when the saving in excavation, size of footings, number of piles and time of completion are taken into consideration, this additional cost per foot is discounted. Generally when these items of cost are considered, they should show a decided advantage in favor of concrete piles.

The length of cast in place piles is limited, but piles cast and driven may be of any length. When driven with a core or pipe, the maximum length thus far attained is 45 ft.; no cores have been made longer than this, while the difficulty experienced in pulling the pipe renders a greater length impracticable.

Cast and driven piles require careful handling if made in long lengths as cracks cannot be readily detected, and the piles should preferably be allowed to set several weeks before using. If made on the job this delays the work, while if made in distant yards, the exact lengths are hard to gage, and the piles may be either too short or too long. As the operations of lengthening or shortening cause delay and expense, it is very desirable that the penetration be determined before the piles are brought to the site.

If shells are used, they should be made of steel heavy enough to withstand the side pressures of soft ground or the shearing effect of boulders or gravel. Some objection has been made to dropping concrete through the longer lengths of a cast in place pile. As a wet mixture is used and the concrete is deposited by shovels, it should be properly graded when the pile form is full.

The driving of an adjacent pile tends to settle the concrete in the pile just filled, thus forcing out the air bubbles, and while distortion may occur, particularly in the case of piles driven without a shell, this danger has not been manifest in actual practice.

In cast in place piles, unprotected by a shell, it is impossible to inspect the integrity of the pile. After the concrete leaves the end of the pile, it is subjected to the action of the surrounding ground without protection. Soils bearing running water may carry off a part of the cement, leaving the coarser aggregates; very dry, porous soils may absorb the water needed in setting; in either case the bearing power of the pile would be affected.

As in the case of peeled wooden piles, a smooth exterior offers less resistance to movement than a rough one. However, when the

attempt is made to increase the skin friction by cementing the pile to the earth in which it is cast, a question arises as to how much the pile itself is weakened by an admixture of earth. The necessity of reinforcing concrete piles in certain soils is apparent, and the greater the dependence placed upon point bearing, the greater the necessity for reinforcing.

The bearing power of all piles is dependent upon a combination of two elements—viz.: point bearing and skin friction. Point bearing depends upon the class of material upon which the pile rests, the area of the point, and the material of which the pile is made. Skin friction depends upon the compression of the earth through which the pile is driven, and all the earth, from the top to the bottom of the pile, adds to its bearing power if subject to compression.

Probably the bearing power of every pile driven is dependent upon both the above factors, the percentage of each varying with the character of the soil and the shape of the pile. The larger the point and the less the taper of the pile, the more point bearing is depended upon, and vice versa. A pile depending upon point bearing acts as a column, supported more or less at the sides, and any pile acting as a column should be reinforced. When subjected to bending stresses or placed in semi-liquid or shifting soil, piles should be reinforced. Piles whose method of manufacture precludes the insertion of reinforcement are not adapted to use in service which requires action as a column.

Prices of Water for Building.—The prices charged for water used in building and trenching at Little Falls, N. Y., are as follows:

Per 1,000 brick laid	1 cts.
Per 100 sq. yds. plastering	20 cts.
Per cu. yd. stone masonry	3 cts.
Trench 2 ft. wide per lin. ft. per ft. depth	¼ ct.
Trench 2 to 3 ft. wide per lin ft. per ft. depth	⅜ ct.
Trench 3 to 4 ft. wide per lin. ft. per ft. depth	½ ct.

E. W. Gayman, Ogden, Utah, has been awarded the contract for constructing nine miles of the Portneuf March Valley Irrigation Co.'s canals near Downey, Idaho.

Earth and Rock Section

Note: This section is devoted to methods and costs of excavating earth and rock and building embankments. It will cover the grading of roads and railroads, diking and canal work, dredging, building reservoirs and earth dams, sewer and water pipe trenching, quarrying, etc.

Method of Reconstructing the Washington Street Tunnel of the Chicago Railways Company; a New and Economical Method of Constructing Tunnels.

The Washington street tunnel of the Chicago Railways Co., abandoned several years ago, is now under reconstruction by Geo. W. Jackson, Inc., of Chicago. The former tunnel was condemned by the U. S. government engineers in 1906 because its roof had been weakened by contact with heavily laden freight vessels, which had at different times become lodged upon it and because of the requirements of navigation, which called for a deeper channel in the river. Accordingly, in 1908, the river section of the tunnel, which is about 200 ft. long, was bulkheaded off and pile drivers in the river battered down the roof and the material was removed by dredges. Before this was done, however, the roof of the proposed new tunnel was built. This roof is slightly above the floor of the old tunnel. It is a flat roof and is constructed of 36-in. steel girders imbedded in concrete 4 ft. thick. The roof is at a depth of 26½ ft. below the water surface of the river.

The present reconstruction calls for the completion of the tunnel and is being carried out under two separate contracts, both contracts, however, being held by the Jackson company. The entire work under both contracts extends from Clinton St. on the west to Franklin St. on the east, a distance of 1,544 ft. When completed, the work will provide twin tubes for the proposed Chicago subway between the streets mentioned. Until the subway is built, the surface cars will pass under the river through this tunnel. Provision has been made, by the construction of a temporary timber trestle, for the surface cars to enter the west end of the tunnel at Clinton St. and the east end at Franklin St. This arrangement is shown in profile by Fig. 1.

SECTION I.

The west end of the work for one block, between Clinton and Canal streets, is being carried on by the open cut method. This work is called Section I and is covered by a separate contract.

The new Chicago & Northwestern Ry. terminal passenger station is being erected simultaneously with the construction of the tunnel, and the steel work for the elevated train shed of the station passes directly over the entire work. On account of this the work has been difficult and complicated. Steel columns supporting the frame work of the train shed extend down inside the tunnel walls on both sides of the tunnel to circular concrete footings just below the level of the tunnel floor. These footings were put in before the tunnel work was commenced and were carried down to solid rock, some 90 or 100 ft. below the street level. The columns resting on these footings were concreted in with the tunnel walls and give the appearance of pilasters on the tunnel walls.

The steel sheeting used for this work consisted of 15-in. I-beams, with clips bolted to the flanges. These clips were made to fit over the flange of the adjacent I-beam. This is not water-tight sheeting, and is used by the company on dry work. Two portable pile-driver outfits, equipped with No. 2 Vulcan

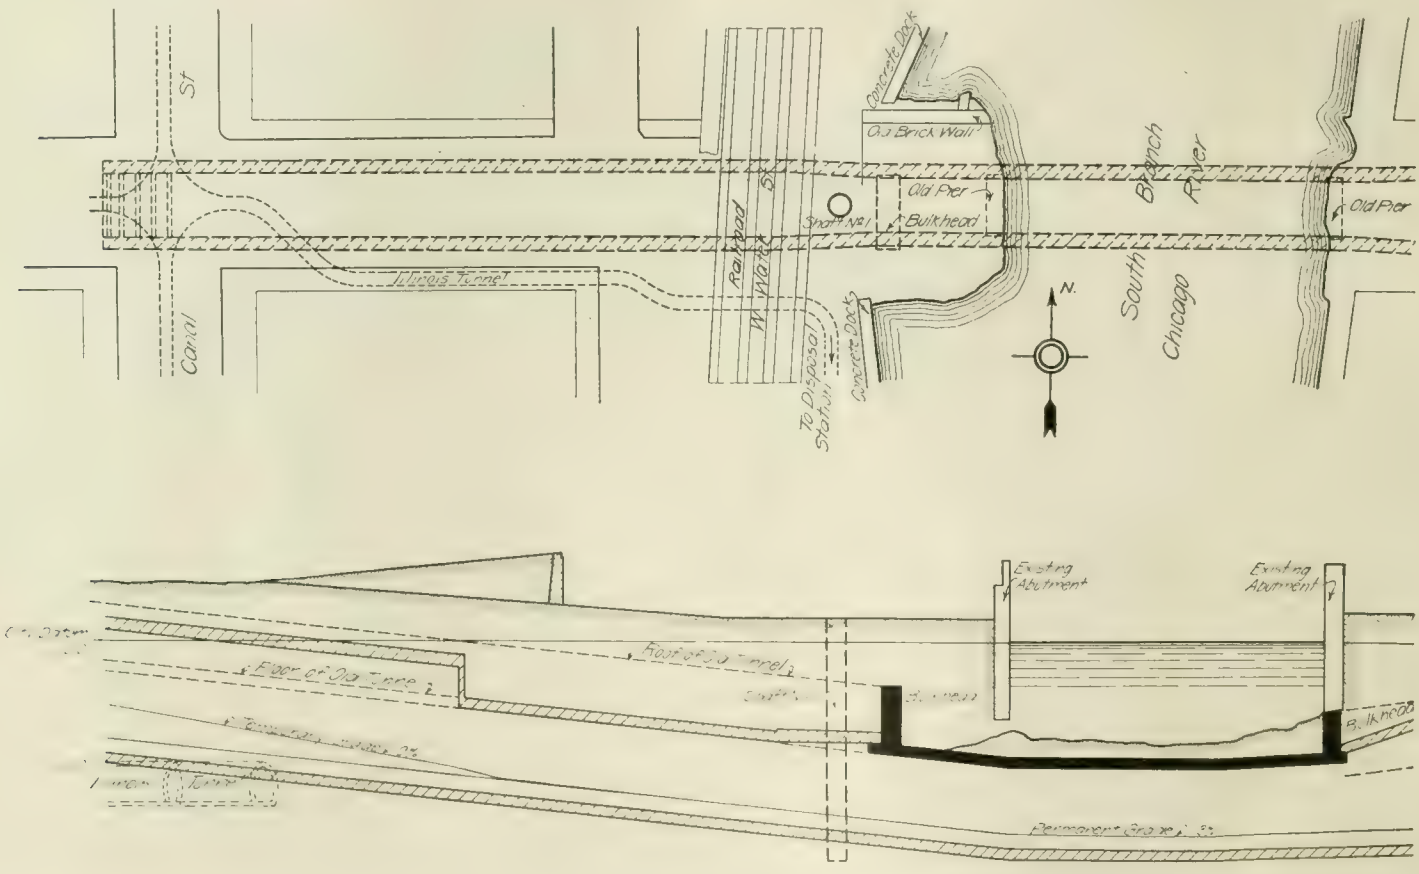

Fig. 1—Plan and Profile of the Reconstructed Washington

steam hammers, operated along opposite sides of the work in advance of the excavation. The rate of driving sheeting was from 15 to 18 pieces per shift of 8 hours, the record being 29 pieces.

The excavation was carried on by hand. The material—blue clay—was shoveled into cars running on narrow-gage tracks. The disposal of the material was greatly facilitated by connections made with the Illinois freight tunnel, which passes only a few feet below the work at this point. The narrow-gage cars operated from the points where the digging was in progress to the chutes, where the cars were dumped directly into the cars in the tunnel below. In these cars the spoil was taken to the Geo. W. Jackson disposal station on the west back of the Chicago River at Madison St. and was then dumped into barges to be towed out into Lake Michigan. The completed cut was 338 ft. in length, 42 ft. wide, and from 38 to 42 ft. deep.

The bracing consisted of 12x12-in. timbers placed transversely 8 ft. apart and in 4 tiers, the top tier being 1 ft. below the top of the sheeting and each tier 6 ft. below the one above it. In each tier 12x12-in. timbers were used as lateral bracing and vertical posts were placed between tiers.

The mixer was located at the east end and was placed so that the hopper was at street level. This permitted dumping the materials directly from the street into the mixer. A Lidgerwood 450-ft. span cableway was used to carry concrete to the west end of the work. After the completion of that part involving a long haul, the cableway was taken down and cars were used for transporting the concrete from the mixer to chutes placed conveniently for filling the forms. The forms nearest the mixer were filled by placing chutes directly under the mixer discharge.

An 8-in. waterproofing course was laid, consisting of brick laid in asphalt. The specifications called for 1 in. of asphalt between bricks and 1 in. of asphalt on the exterior surface. This waterproofing course is adjacent to the exterior face of the main tunnel wall and was built in sections of 6 ft. After a section of waterproofing had been laid, an outer protection course of 8 ins. of concrete was added. This concrete was kept separated from the steel sheet piling by light forms. Sand was poured between these forms and the sheet piling to prevent any settlement when the piling was removed.

The work for Section I is about half completed, the side walls and invert having been finished. It is estimated that it will be ready for use about Aug. 1, 1910.

SECTION II.

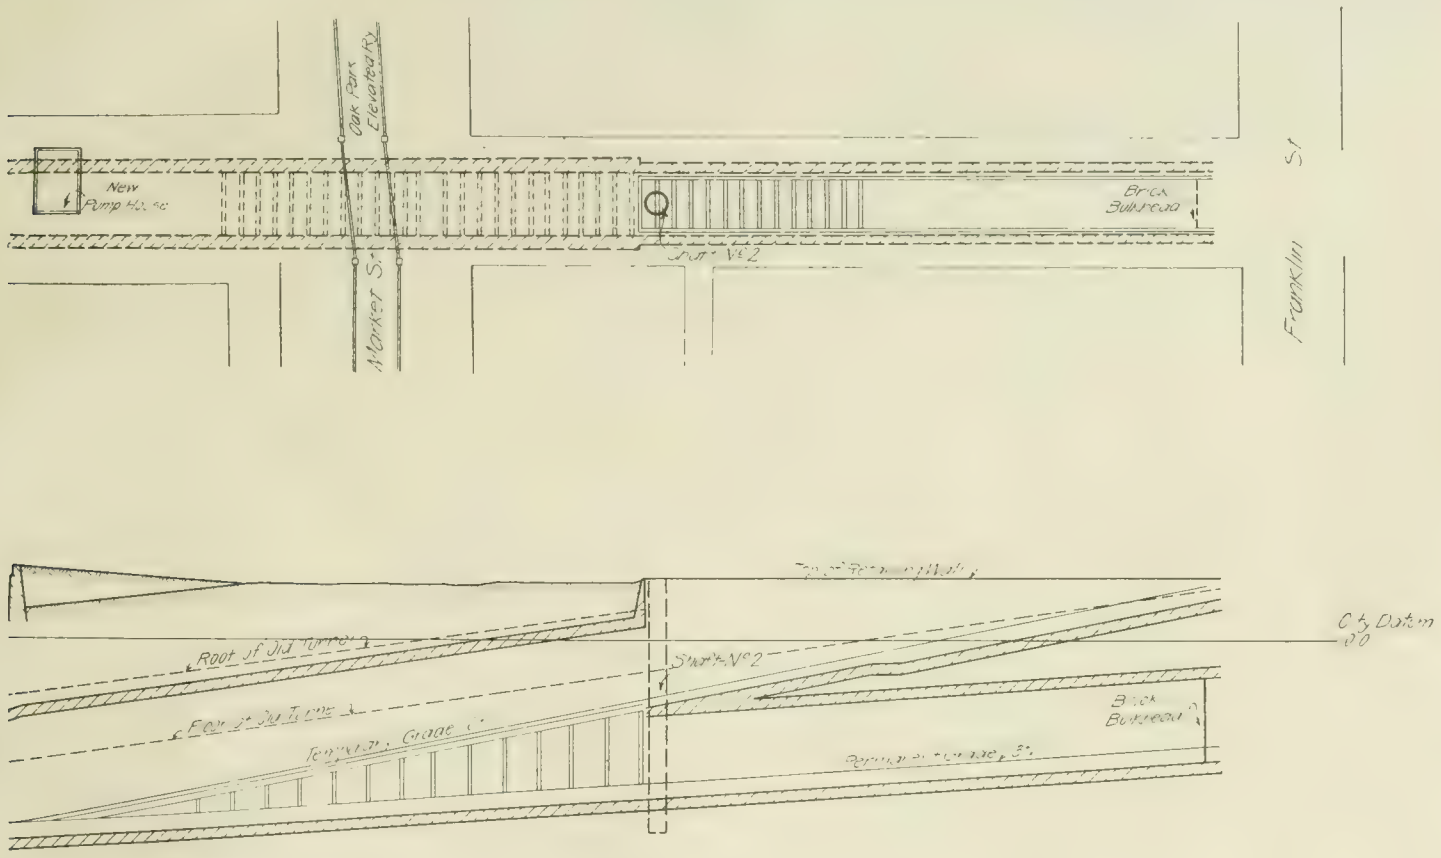
This section of the tunnel extends 1,204 ft. from the west line of Canal St. under the river to the west line of Franklin St. This includes all of the work east of Section I.

The original intention in handling the work on Section II was to use the open cut method. Mr. Jackson, however, having had a great deal of experience in tunnel work, devised a much better way. His plan was agreed to by the engineers representing the Chicago Railways Co. and has been so far carried out. The new method is safe and economical and has caused no obstruction to street traffic or navigation. Mr. Jackson has had the method patented. The method may be clearly understood by reference to the accompanying sketch, Fig. 2, showing a cross section of the river section of the tunnel. The sections of wall marked 1 on the sketch were excavated and timbered the entire length, under compressed air, and then concreted, leaving key for sections marked 2; then sections 2 were excavated complete, under compressed air, the lagging floor removed, and the section concreted. This completed the side walls in the river section, and, as previously described, the roof had already been placed. The work is now this far completed. It remains to excavate the tunnel between the side walls and to put in the invert, which will be put in in sections of 3 ft.

The work under contract for Section II is being carried on in two distinct parts, each part being about 600 ft. long and operated from a shaft located about the center of the work which it handles. These shafts are shown by the profile, Fig. 1. Shaft 1 is located about 100 ft. from the west bank of the river and handles all the work from Canal St. to the east bank of the river, including the river section of the tunnel. Shaft 2 is located at Market St. and handles all the work east of the river to Franklin St.

A separate plant has been established at each shaft so that they are operated independently. Each power plant consists of two compressors and tanks, and a hoisting engine for the operation of the shaft elevator. At Shaft 1 a battery of three 80-h.p. boilers is installed to supply power for the machinery. At Shaft 2 electric power is used, the machines being belted to 25-h.p. moto s and current being obtained from the Commonwealth Edison Co. At each shaft is an office, power house, and cement shed. The work is under direction of a superintendent of construction, whose office force consists of a clerk and time keeper, besides the civil engineer, who divides his time between the work at both shafts. Three shifts of 8 hours are worked, beginning at 8 a. m., 4 p. m., and midnight.

The shafts are of similar construction, each being about 7½ ft. in diameter and braced with steel rings. After the shafts were sunk a 10-in. wall of concrete was built up as far as the old tunnel floor, but the elevator guides are continued up so that the elevator may rise to a point about 15 ft. above the street. The depth of Shaft 1 is 68 ft. below ground level and Shaft 2 is 59 ft. deep. At the bottom of each shaft drifts were made each way on the center



St. Tunnel of the Chicago Railways Co., Chicago, Ill.

line for a distance of about 30 ft. from the shaft. At the ends of these drifts are doors, large enough to admit the cars. These doors lead into the air locks. Each air lock is about 18 ft. long by about 6 ft. high and 5 ft. wide, and is lined with concrete. A 4-in. Worthington pump is placed in a small compartment at the side of one of the air locks at each shaft. These pumps take care of the seepage in the sump. As the work is comparatively dry, as underground work goes, the pumps have been operated only a portion of the time. Beyond the air locks the main drift extends about 30 ft. and there diverges in two directions leading to either side wall of the tunnel. These branches leading to the headings in the side walls were made level with the bottom section of the wall and the first 9 ft. of the wall was excavated as described in explaining the general method. After the first section of the wall was completed the branches from the main drift were raised on a steep grade to a point on top of the completed section of the wall and the excavation was carried ahead at this level. A 5-h.p. motor is located at the sum-

mit of each grade, and is attached to a drum and cable, which are used to haul cars of material up the grade.

As fast as the excavation progressed, the drifts were timbered and the wall forms were placed. The wall forms were made of 3x8-in. lagging. The lagging was held in place by the pressure of the earth from without and was braced on the inside by steel frames 3 ft. apart. The frames consisted of two 5-in. channels placed vertically against the inside face of the lagging and adjusted to the batter of the wall. Two 4-in. I-beams were used to brace the channels apart. One I-beam was placed 6 ft. from the bottom and the other at the top of the section.

The excavated material was disposed of by means of a timber trestle, the floor of which is about 15 ft. above ground level, and which leads from the shaft to the river. Cars of spoil were brought up through the shaft to the trestle level and they were pushed by hand to the river end of the trestle, where they were dumped into barges. The trestle is double tracked and is wide enough to permit the storage of small piles of lumber and various materials used in mining. The spoil from both shafts was thus delivered to barges in the river in much the same way, the only difference being that the trestle from shaft 1 is about 75 ft. long and from Shaft 2 is about 350 ft. long.

The concrete for the work at Shaft 1 was mixed in a Chicago Improved cube mixer of ½ cu. yd. capacity. The mixer was placed about 50 ft. from the shaft. As the space for unloading material for this mixer was limited, a part of the material was brought by water on barges. The concrete was handled from the mixer in the same cars used for the excavation. The cars are of steel frame and wood bodies of ½ cu. yd. capacity, and are made so that the ends of the boxes may be removed for convenience in handling timbers. The

concrete was mixed medium wet, so as to be easily tamped back into place in the wall forms.

The concrete plant for Shaft 2 was located in the open part of the old tunnel, as shown by the profile, about 50 ft. east of the shaft. The mixer is a ½ cu. yd. capacity Ransome mixer. The material is dumped by wagons from the street level into this old tunnel approach at a

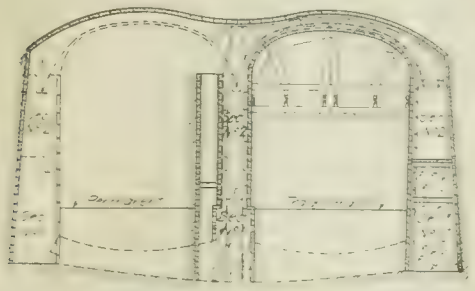

Fig. 3—Cross Section Showing Method of Constructing Washington St. Tunnel.

point just above the location of the mixer. This arrangement has been very convenient. The approach of the old tunnel contains ample space for the storage of stone and sand. The cars are loaded from the mixer and enter the shaft at the level of the old tunnel floor.

The waterproofing of the walls of the tunnel will be accomplished by piping the waterproofing material in 2-in. pipes under high air pressure. Pipes have been inserted in the walls 4 ft. apart at the top of the lower section and 2 ft. apart at the top of the upper section. Through this system of pipes the waterproofing will be forced into the voids between the outside lagging and the earth.

During the progress of the work hourly reports have been made out and telephoned to the main office. Two sets of reports, one for the excavation and one for the concreting, have been kept. These reports have assisted the contractor greatly in directing the entire work and have enabled him to solve difficulties as fast as they arose. Fac-similes of these reports are shown by Figs. 3 and 4.

Fig. 5—View Showing Hydraulic Jack Device for Pulling Steel Sheet Piles.

About the same number of men has been employed at each shaft, there being on each shift 10 miners, 4 muckers, 2 dump men, 2 air-lock tenders, and 1 stationary engineer, besides the office force. The miners do the excavating, put in the timber and forms, and handle the concrete in the headings. With this number of men four headings are handled. The scale of wages paid by the contractor is posted on the job and is as follows per 8-hour shift:

Miners	$3.25
Muckers	2.60
Car pushers	2.35
Air lock tenders	2.80
Elevator men	2.60
Dump men	2.25

The progress made in excavation in each heading has varied from 6 to 9 ft. per shift. This would be on an average about 14 cu. yds. per heading per shift. The amount of concrete placed per shift in each heading was also about 14 cu. yds., but the rate of lineal progress was from 9 to 12 ft. because of the smaller cross section.

The time necessary to do the work was originally estimated at about a year, but the work was commenced on Jan. 11, 1910, and is now—about half completed, and it is estimated by the contractor that it will be completed some time in August.

This work has been especially interesting to engineers and contractors because of the successful working of this special method of building tunnels in soft material. Credit is not only due to the contractor merely because the work has so far been accomplished, but it is due also because it has been accomplished by a unique method which has proved very economical, and has not interfered with street traffic or with navigation. By the open cut method one-half of the river would have been occupied at a time for a period of over a year, and the streets would have been closed to traffic continuously. During this work there have been no coffer dams to build, maintain, and pump out, and the cost of construction has been greatly reduced. Perhaps the greatest saving of all is effected by the manner of excavating the bore and putting in the invert. The excavation in the bore amounts to over one-half the total amount of excavation for the tunnel. This work, and putting in the invert, may now be accomplished without air pressure, and the slow and expensive handling of materials through the air locks will be avoided.

Fig. 6—View Showing Method of Excavating Headings for Side Walls.

Cost of Excavating 1,850 Cu. Yds. of Granite in Trench for Sewer Construction.

The excavation was for an 18-in. sewer built at Muskaka, Ont. This sewer had a total length of some 1,300 ft., but only the 550 ft. in rock trench is referred to here. The rock was Laurentian granite and the trench was 9 ft. deep. The excavation was by drilling and blasting, the rock being hoisted by horse derricks and skips and deposited in horse drawn cars operating on track. The haul was some 1,500 ft. for about two-thirds of the spoil and less than 300 ft. for the remainder. The total amount of rock excavation was 1,850 cu. yds., and the itemized cost of excavation was as follows:

Superintending.	Total.	Per cu. yd.
Walking boss, at 60c per hour	$ 222.45	$0.12
Clerk and timekeeper, at 37½c per hour	158.60	0.085
Foreman, at 45c per hour	608.15	0.328
Total for superintending	$ 989.20	.....
Labor Mucking, Loading, Hauling and Dumping:		
Laborers, at 20c per hour	$2,877.00	$1.555
Teamsters, at 21c per hour	499.70	.270
Teams, at 40c per hour	1,010.60	.545
Cars, at 5c per hour	117.00	.063
Carts, at 5c per hour	65.50	.035
Derricks and power, at 15c per hour	175.50	.095
Handy men, at 27½c per hour	125.15	.067
Total labor	$4,870.45	$2.630
Drilling Rock:		
Foot drilling, at 30c per ft.	$1,245.00	$0.673
Sharpening drills, at 27½c per hour	250.80	.135
Nippers, at 17½c per hour	382.20	.206
Coal, at $10 per ton	29.00	.157
Total	$1,907.00	$1.171

Explosives:		
Electric fuses	$ 95.95	.....
Caps and fuses	23.20	.....
Batteries, rent	38.00	.....
60% dynamite, at $10 per box	1,020.00	.....
Total	$1,117.15	$0.636
Grand total		4.97

Fig. 7—View Showing Method of Timbering Headings.

To the above total must be added $9.30 for depreciation of plant or 50 cts. per cu. yd., making a total cost per cubic yard of $5.47. In studying this cost it must be noted that the trench was narrow, and small shots had to be used, making the amount of drilling large; 1 ft. of hole was drilled per 4.5 cu. yds. excavated.

The above data are arranged from a paper by E. A. James in *Applied Science* for March, 1910.

Panama Canal Dynamite Records.—The records of the office of the Division Engineer of the Central Division show that 473,965 lbs. of dynamite were used during the month of January, 1910, as compared with 578,000 lbs. in January, 1909, although in the former month, 1,132,576 cu. yds. of rock were excavated, as compared with 1,032,016 cu. yds. in Janary, 1909. The comparison shows further that 2.39 cu. yds. of rock were excavated per pound of explosive used in January, 1910, as compared with 1.79 cu, yds. for January, 1909, a gain of over 33 per cent in rock excavated per pound of explosive used. The showing is still more pronounced in the February comparison. The total dynamite consumed in February, 1910, was but 375,000 lbs., as compared with 625,150 lbs. in February, 1909, while the amount of rock excavated in February, 1910, was 1,133,136 cu. yds., as compared with 1,037,645 cu. yds. in February, 1909. This shows that 3.02 cu. yds. of rock were excavated per pound of explosive used in February, 1910, as compared with 1.66 cu. yds. for February, 1909, a gain of 82 per cent in rock excavated per pound of explosive used. While accurate for the amount of dynamite use, and for the amount of material excavated, the figures relative to the quantity of material removed per pound of explosive used, are not cited as absolutely accurate, for the reason that during the dry season the steam shovels gain on the mining, but as the rate of gain so far as can be ascertained, was about the same in February, 1910, as in February, 1909, the comparative ratio would differ but little for the months in question. The figures show clearly that the amount of dynamite used in the Central Division has decreased, and that the decrease is more marked when the quantity of material excavated is taken into consideration. This in premature is taken from the Canal Record.

Cost of a Record Steam Shovel Run—On March 22, 1910, steam shovel No. 213 in the Culebra District of the Central Division of the Panama Canal broke all records by excavating 4.823 cu. yds. of rock and earth, place measurement. This material was loaded on 235 Lidgerwood cars. The time was divided as follows:

	Minutes.
Time loading	320
Moving up 20 times, 5 minutes each	100
Waiting for cars	55
Coaling shovel	5
Total	*480

*Or eight hours

The following employes comprised the crew of this shovel: J. L. Davies, steam shovel engineer; T. J. Scoville, steam shovel craneman; Edward Ward, pit foreman; Leon de Silva, Daniel Fitzgerald, Norman Austin, Manuel Shoy, Eli Titus, Albert Best, William Quash, James Bailey, pitmen; Alfred Dickson, Percy McCollen, firemen. The cost for labor for running the shovel on this day was $30.21 and the cost for supplies was $24.59, making a total expense of $54.80, itemized as follows:

Labor—	
1 engineer, one day at $7.56	$ 7.56
1 craneman, one day at $6.48	6.48
1 foreman, one day at $2.83	2.83
2 firemen, one day each at $1.67	3.34
1 laborer, 8 hours at 13 cents	1.04
7 laborers, 8 hours each at 16 cents	8.96
	$30.21
Supplies—	
5¼ tons of coal at $4.41	$23.15
3 gallons of car oil at 18 cents	.54
2 gallons of valve oil at 31 cents	.62
2 pounds of cup grease at 10 cents	.20
1 pound of gear grease at 8 cents	.08
	$24.59
Grand total	*$54.80

*This gives a cost of 1.14 cts. per cu. yd.

The Boston & Maine R. R., J. P. Snow, Chief Engineer, Boston, Mass., has had surveys made for a proposed branch line between Brattleboro and Hinsdale, N. H., to connect the Connecticut & Passumpsic division with the Ashuelot branch of the Boston & Maine, operating between South Vernon and Keene, N. H. If this line is constructed it will do away entirely with the 10-mile strip of track on the Vermont side of the river between Brattleboro and South Vernon, owned and operated by the Central Vermont and Grand Trunk railroads, in so far as it concerns the Boston & Maine interests. The Boston & Maine has also had engineers in the field to locate a line from Windsor to West Lebanon, N. H., doing away with the trackage of the Central Vermont between Windsor and White River Junction.

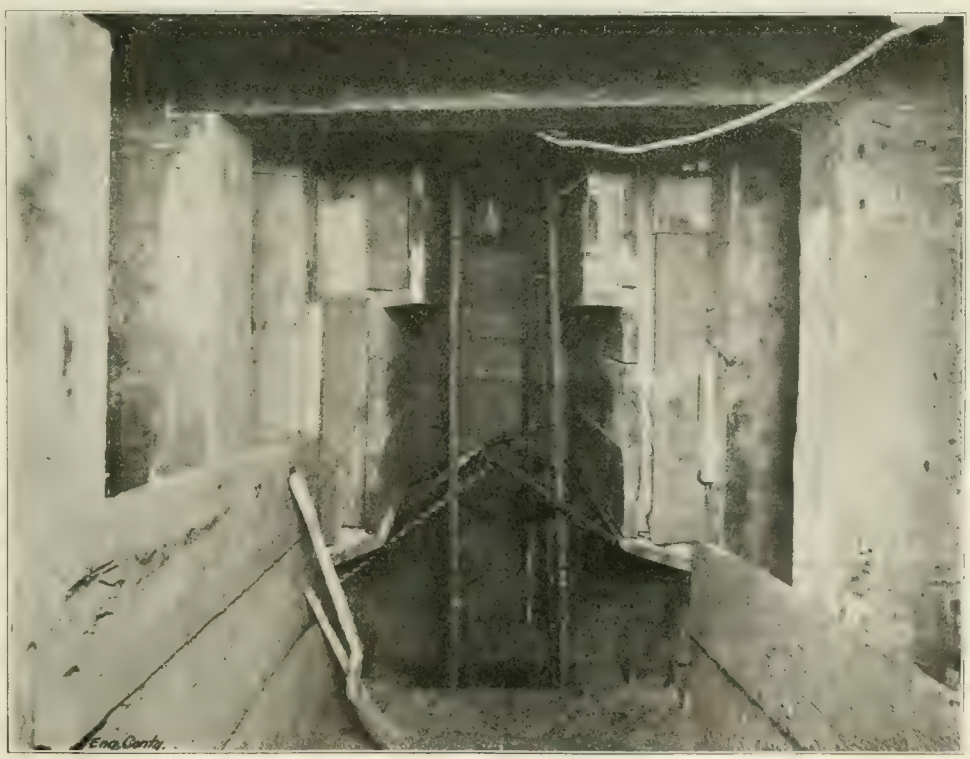

Fig. 8—View Showing Central Wall of Washington St. Tunnel.

Bidding Prices on New York State Road Work.—The following table, taken from the last annual report of the New York State Commission of Highways, shows a summary of the average, the high and the low bidding prices on 212 state roads. These bidding prices were submitted prior to Jan. 1, 1909:

Unit.	Items	Averages.	High.	Low
Acre.	Grubbing & clearing.	$84.00	$800.00	$10.00

The White Pass & Yukon, R. R., V. I. Hahn, Superintendent, Skaguay, Alaska, is to lay four miles of track this summer and complete its spur line to the Pueblo copper mine at Skaguay.

Roads and Streets Section

Note: This section is devoted to methods and costs of road and street construction. It will cover road building in all its details, the construction of pavements, sidewalks and gutters, the testing and use of paving materials and the machinery and tools used in road building and paving.

Method of Constructing Sand-Clay Roads in the Middle West and Cost Data on the Construction of Four Roads of This Type.

Although the sand-clay method of road construction has been extensively and successfully used for many years throughout the southern states, it is only recently that an attempt has been made to use this method in the West. In 1908 the U. S. Office of Public Roads began a systematic investigation and study of the road problem and the conditions bearing thereon throughout the Middle West, particular attention being given to the possibilities for the construction of sand-clay roads. The general character of the formation of that section was studied and experimental roads were constructed by the sand-clay method in various sections with the materials which were to be had locally or within permissible hauling distance. The results of this investigation have been set forth by Mr. W. L. Spoon, superintendent of road construction, U. S. Office of Public Roads, in a circular recently issued by the U. S. Department of Agriculture, and the matter that follows has been taken from this circular.

Fig. 9—View Showing Reinforcement for Side Walls Washington St. Tunnel.

GENERAL METHODS OF CONSTRUCTION.

Sand-Clay Construction in the Gumbo or Plastic Soil Sections—In these sections the one primary consideration is the selection of sand. Since in many cases it must be hauled quite a distance, great care should be exercised in the selection in order to procure the sharpest and coarsest sand possible. After the sand is selected it is a good plan to haul it, in advance, alongside the road which is to be improved. When the road softens, a quantity of sand should be spread broadcast over the traveled roadway for the desired width—about 14 to 18 ft.—until the softened clay surface of the road is saturated with the sand. In this way the advantages of hauling the sand on a firm, dry clay road are obtained and it is ready for use when the road is softened by rain and slightly cut by travel. The amount of sand to be used is determined by the character of the road. If the road is taken before it is deeply cut by travel less sand will be required to give it a hard surface than would be the case were it delayed until deeply cut and full of mud holes. No ultimate harm would come from allowing it to become deep mud, but an unnecessarily large quantity of sand would be required to effect a remedy and would entail needless expense for surface material. For the first application of sand from 5 to 8 ins. should be sufficient to give a hard surface to almost any well-drained road, however plastic it may be. If, however, the surface is deeply cut, it may require twice as much sand to form a good road. This caution is given for the sake of economy both in hauling the sand to the road and in using it afterwards, rather than in the final effect to be obtained. However deep the mud hole may be, sand can fill it and make it permanently firm for travel. Although this is effective in improving the worst mud, still it is expensive and great economy will result by applying sand when the clay is softened, to a depth of about 3 or 4 ins. An excellent state of preparation can be had by driving a herd of cattle over the road when wet and at the same time adding the sand. By this simple method a thorough mixture of the surface clay and sand is formed, and, as it dries somewhat, a split-log drag may be used to produce the crown and maintain it until the road is hard and smooth under travel. Should any place in the road fail and become muddy, more sand must be added each time such a failure is noticed. If this direction is followed the result will be quite satisfactory, notwithstanding its simplicity. In the absence of the herd of cattle an excellent surface condition preparatory for the sand can be obtained by using a disk or tooth harrow to loosen the surface of the clay.

While it has not been specifically stated, it is assumed that the road to be improved has been properly laid out, drained, and graded to the desired crown before being prepared for the application of the sand. The subsequent dragging is merely to even inequalities while the road is settling under traffic. If a coarse sand is not available any clean sand available may be used. It is often a matter of using, not what one judges best, but such as can be had within the means of the supervisor. Any sand will improve a clay road.

Simple as this method is, it is nevertheless applicable to the whole plastic clay belt. Roads which are now almost impassible in rainy weather, may be rendered practically firm for all travel and even well suited for automobiles. The depth of the sand-clay mixture must be in proportion to the burden of travel. If the road is to withstand very heavy travel and extreme weather conditions, a deep sand-clay composition will be necessary, and there should be only clay enough in the composition to fill the voids in the sand and to act as a binder.

From a careful study of conditions it is believed that the application of sand, as above described, will prove a practical solution of the road problem for the plastic clay soils. Where sand is not available locally it may be transported by rail, delivered in chutes, loaded therefrom by gravity into wagons, and hauled

to the roadside for less cost than macadam, and in most cases it will prove equal, if not superior, to the more expensive macadam road. But no half-hearted effort should be attempted. A steam shovel should be used to load cars of the ballast type, and they should be unloaded into chutes by gravity at the desired station. The sand may then be dropped into dump wagons, hauled to the place of use, and dropped in sufficient quantity in regular order along the road to be improved. This is a practical and economical method by which much may be accomplished.

Improving Loam and Alkali Soil Roads.—Usually the loams have a very good degree of fine sand intermixed, and careful attention to drainage and the crown often proves sufficient to make a good road, if dragged occasionally when wet. Especial care should be given to drainage if the body of the road is to be of loam. The traveled roadway should be at least 18 ins. above the level of ditch water. It is also important to provide against either of two extremes—water standing in the side ditch or flowing too great a distance down a slope in the ditch. Both are disastrous to the road. The one saturates and softens the road bed, causing it to fail, and the other forms a gully of the ditch and washes the road away. A good maxim is "Ditch the side ditches." This is of great importance and well worth remembering. It not only applies to a loam soil, but to all kinds of soils and conditions with one exception, viz., where the sand subsoil is several feet deep and sufficiently porous to absorb any rainfall no side ditch is required and no attention need be given to the drainage of the road beyond crowning the sand-clay surface. Such deep sand is found only in the sand hills. In all cases where the sand is under 10 ins. deep or underlaid with clay or hardpan of any kind, well-constructed side ditches must be provided.

All forms of hard roads should have a good crown, varying from side to center. The slope of the crown should be greatest at the sides and flattened as it approaches the center. Only a sand road requires no crown at all. Where nothing but deep sand prevails, the surface should be concave for the purpose of conserving, as far as possible, the moisture. Sand alone is improved by water.

The same directions given for loam constructions may be followed in the case of alkali soil. A difference, however, usually exists in the case of alkali soils. They are more sticky and are flat and low. The one thing, therefore, of prime importance is drainage. To effect this it is often necessary to build up the road above the adjacent land. It is more important usually to build up an alkali soil road than one of loam soil because the alkali is more liable to failure where imperfect drainage exists. For this reason it is important that the road should have a width of not less than 30 ft., in order to give permanency and utility to the traveled way, and a sodded shoulder on either side to prevent washing.

If the construction of the road in alkali soil is followed with systematic and faithful dragging a very satisfactory road will be obtained. Should a muck-like condition continue after each rain and the road fail to harden satisfactorily it should be treated with an application of sand as outlined for gumbo.

Use of Sand-Clay on Sand-Hill Roads.—Perhaps the sandy roads in the sand-hill regions of the Middle West are the worst stretches of road to be found in this country. They often lie as impassable barriers between fertile lands and vary from a few hundred yards to several miles in width. To haul a load across a mile of such sand costs ten times as much as on a hard, smooth surface. It is, then, a most vital matter for the people living in the vicinity and having occasion to use these roads to build hard-surface roads through the sand. Many experiments have been made with varying results, but so far it appears that the sand-clay road is the practical road, and particularly so in the semiarid regions. Indeed, it appears that here the sand-clay road is capable of yielding the most satisfactory results both as to service and durability. Because of the dryness of the climate the clay rarely becomes oversaturated; on the other hand, however, the sand always contains enough moisture to keep the base of the clay in a state of sufficient moisture to prevent cracking at the bottom of the clay. This percentage of moisture, while small, is sufficient to strengthen the road surface greatly; but while this factor is important, there is another equally as advantageous in the porous character of the sandy base. It allows the excess of moisture to percolate, however hard it rains; there is therefore an interesting principle disclosed in this deep sand. It may be compared to a governor regulating the moisture admitted to the clay from beneath. According to this principle, one would expect to find the best sand-clay roads where the sand is deepest, and such is the case. The sand furnishes a perfect underdrainage and yet capillarity supplies the right amount of moisture to maintain the bond in the clay and prevent its becoming thoroughly dry, in which case it would crumble to dust and be dissipated either by the wind or in the deep sand. Again, this principle makes it possible and even practicable to have a satisfactory clay road on deep sand when the clay is largely in excess. Such a road would utterly fail on a clay foundation. Here, again, this principle is of great advantage, because the clay can be left in excess in the body and sand added to the surface only after the clay has been applied.

The importance of a careful location is not always as seriously considered as the nature of the case justifies. It too often happens that an effort is made to follow the section line. Normally, in lands valuable for cultivation, this may be justified, but in grazing lands, where the roads should be located with a view to an economic maintenance and an economic haul over the road, both of which require low grades, the case is not the same. Again, to build a sand-clay road over the top of a sand hill is to invite the winds to destroy it. It is therefore of importance that the location be as free from grades as possible and protected from drift sand or "blows."

After the location has been selected a roadway not less than 30 ft. wide should be laid out. All inequalities should be graded out so as to give a smooth road with a uniform cross section. When this has been done stakes should be set for the center line of the road, and for this purpose plaster laths serve excellently. With a turning plow a furrow should be run up one side of the row of stakes and back on the other side, throwing the dirt toward the stakes. In this way a ridge is made exactly in the center of the road. Then a roadbed should be thrown up to the width to be clayed by backfurrowing to this ridge. A drag or harrow should be used to smooth this bed and the crown should be carefully made to conform to the proposed finished road. A good practical width for this bed is 14 ft. After the central section has thus been prepared and smoothed with a harrow or drag the shoulders should be backfurrowed on both sides of this clay bed with the turning plow. To do this the plow should be set so that it will discharge the material in a ridge just outside of the last furrow made in forming the bed. Thus by several rounds with the plow the shoulder is raised sufficiently to form a protection to the sides of the clay when placed in the prepared bed. Usually five such furrows on either side complete a 30 ft. road to the ditch line. When this is done the sand bed is ready for the clay to be hauled upon it.

If in the foregoing operation any stakes have been misplaced from the center they should now be restored in order to maintain the center line of the road definitely. The first six or eight loads of clay should be dropped exactly in line with these center stakes. The next loads are dropped on one side of the center loads, inside of the shoulder, but only about half as many should be dropped on the side as were dropped in the center. Clay should then be dropped on the other side in the same manner. This work should be done in such a way that the center line is some 50 ft. in advance of one side line and the first side line about the same distance in advance of the other—an arrangement by which three loads can be unloaded at once. With this plan the teams will not be blocked in hauling, and, furthermore, by keeping the center line well in advance of the sides it is an easy matter to keep the road true and even.

After 200 lin. yds. of the road have been covered the clay should be spread. It is important not to begin to spread the material immediately after being dropped upon the road. The reason for this will appear later. Nothing is better for the purpose of spreading the clay than a 2-horse 2-wheel grader. The spreading is begun by pushing the side loads toward the center to fill in the space between the center and the side loads which has already been rolled by the wheels of the loaded wagons. After this has been done the hauling should be continued until the material has been thoroughly packed by the wheels of the loaded wagons passing over it. The center may then be brought toward the sides with the grader and the entire road smoothed. Travel may now be freely allowed on any part of the surface of the road. If the loads of clay average 1 cu. yd. each they should be dropped touching each other in the row, but if less than 1 cu. yd. they should be slightly lapped. The person in charge of this part of the work should exercise his judgment in the matter of dropping the loads according to the size in order to secure the desired depth of clay, which should not be less than 6 ins., while it may be as much as 12 ins. when very heavy loads, such as traction engines, are to pass over it.

The side loads should be pulled toward the center first for the purpose of preserving the crown and keeping the material well toward the center, since it is easier to cut down the crown later, if too high, than to build it up. This is also important for the reason that the teaming must be depended on to do the rolling, since it is not expected that a roller will be used. Moreover, if the center is left undisturbed the teams will naturally follow on each side of the crown and, in consequence, the wheels of the loaded wagons will roll in the proper place to give the greatest rolling effect to that part of the road which will afterwards bear the heaviest burden of travel, leaving the material of the center loads in condition to be handled by the grader when the center is to be dressed. Then, last of all, the surface is finished with the grader. Especial care has been taken to make this detail clear, for upon careful attention to it depends the smoothness of the road when completed. Perhaps no part of the construction is as important as the matter of providing an even texture and a surface in the outset free from small depressions. For the semiarid sand hills this is especially important, because it is not the purpose ever to break the bed of clay up entirely in the application of the sand. If by neglect or other cause the clay has been dropped improperly, causing a thin place, the necessary repair should be made at once and all the material should receive the same rolling in construction. It is quite important in the semiarid territory to have the clay fairly well compacted before the sand is added, and to add sand only on top of the clay, in the manner described above for sticky soils. Indeed, the construction is identically the same, after the clay has been placed on the deep sand, as that described for gumbo or any other clay district, with this exception—the sand, in the case of the sand-hill road, will not have to enter as deeply into the clay or form as large a percentage in the composition, except for the upper inch or two of the surface. The greater part of the clay remains undisturbed as when placed on the sand. It is expedient and proper, however, to have at all times a coating of sand on the road. After the road has been properly smoothed the grader may be reversed with good effect to bring a covering of sand from the sides of the road, which have been previously plowed up for the shoulders during the preparation of the roadbed. It may happen that by hauling over it the clay will be pulverized to such an extent that an inch or more of dust may form on the surface. In this case the fine, mechanical separation can be used to advantage by incorporating an abundance of sand with the dust. Sufficient sand, fully twice as much as the amount of

dust, if gumbo, should be added and thoroughly mixed by means of a tooth harrow. When the rains come only mucking and settling remain to complete the composition.

There is one important thing to avoid in this dry climate. The clay should not be disturbed deeper than there is moisture to reunite it at the time that sand is added. The road should be built of clay, covered with sand, and left to the rains to soften the clay so that it can absorb the sand. The clay should never be pierced to the sand base, for the reason that, if it should be continuously dry for a long time the loose sand would work up from below and cause sandy pockets and sandy places in the road, not unlike mud holes in a clay road in effect. This is quite important in drift and very fine sand.

After the clay has been placed upon the road, sanded, and treated as above described, the turning plow should again be used to build up the sandy shoulders until nearly level with the clayed part. In this way a trap will be set for all the clay that blows or washes to the sides. This is not only permissible in a sand-clay road, with deep sand, but desirable. It is not so in a road entirely of clay, and this distinction should be noted. Another reason for lifting the sand shoulders so high is to conserve moisture, the opposite of what is necessary in the case of sand-clay construction on a clay subsoil. It must be carefully observed that this last suggestion applies to deep sand only and never to shallow sand, where the rain is not at once absorbed. Every effort should be made to conserve moisture in deep sand and a dry climate, because the moisture prevents dust and the consequent blowing away of the road. It is therefore a matter of necessity, if the greatest success is to be attained, that these local conditions be carefully considered in every detail of the construction. The building up of the shoulders is of advantage to the road when it is to be dragged, because then it is an easy matter to get from the shoulders the sand needed on the softened sand-clay roadway.

While it is customary to use the sand along the road, yet if it is very fine and there is coarse sand near by it will often pay to haul a slight covering of the coarse quality upon the clay. This is particularly advantageous where the winds are very strong, because the coarse sand is far more resistant to the winds and far less disposed to break up the clay bond. It acts in the same way that coarse sand does with cement. The shoulders should be plowed out to the ditch line and, as far as possible, vegetation of some kind should be encouraged to grow on the sandy berm. All these points should be observed to prevent the sand from blowing away and leaving the sand-clay road unprotected. If much rain should come and the clay should soften as much sand should be added as the softened clay will mix with well and the sanding should be followed with a drag until the road is again dry and firm.

The maintenance of the road is of the utmost importance for one or two years after construction. Proper care at the right time often saves a whole road from failure. There is nothing permanent about a road except its location, and nowhere is that saying truer than in the sand hills. Even the location is often in jeopardy.

Nothing has been said so far about the choice of the material to be used as the clay part of the sand-clay road in the sand hills. The choice is usually limited to gypsum, alkali soil or gumbo. Sometimes only one is available, but when more than one can be had it is important to know how to select the best. Gypsum varies from a chalklike, nonbinding, easily pulverized mass to a composition of semiplastic gypsum and clay, which, under travel, hardens on the road like cement. This latter is quite useful as a road material, while the former is practically worthless, because it lacks binding power. The binding power is one of the properties to be sought for most carefully. If the material packs readily and pulverizes slowly when dry, or softens slowly when wet, it may be safely accepted as a suitable material for making the surface of a sand road hard. This characteristic alone can be relied upon. Color has little or no significance as to its value.

The alkali soils are more or less variable in composition, usually containing a certain proportion of sand, silt, clay, and organic matter. In some respects they are very much like the loams, but they contain verying percentages of different soluble salts. As a rule, very little sand need be added to an alkali hard surface material. The best results come from spreading it on rather heavily and dragging thoroughly afterwards. Gumbo is one of the materials sometimes met with and, if it is free from grit, a large amount of sand will have to be added. This material has the peculiarity of cracking in every direction when it thoroughly dries out. This makes it necessary to add more sand after each rain and also when the gumbo dries and cracks. These cracks should be filled with sand as often as they appear and this should be continued until sufficient sand is incorporated to stop the cracking completely. This characteristic of the gumbo of splitting up into thousands of little pieces is of immense advantage for introducing sand, but it is of serious consequence in periods of extended drought, because it may cause the complete failure of the road before the necessary sand can be incorporated with the gumbo. If once the sand and gumbo are mixed and compacted by travel, little is to be feared thereafter. It is clear, therefore, that, when gumbo is used, it is important to utilize to the fullest extent every rain, in order to puddle the surface and to do everything possible to conserve the moisture in the gumbo by keeping the sand shoulders high, even above the level of the clay portion of the road. It is better to do this, for the additional reason that it will help to keep the rain water on the gumbo and soften it to a greater depth, and thereby allow a more thorough intermixing of the sand with the gumbo. It should always be kept covered with a little sand. Whatever the variety of gumbo, whether from a lake bottom, the overflow of a river, or an irrigation ditch, its characteristics are practically the same. and it will be valuable as a road material in proportion to its binding power and ability to resist washing or pulverizing and consequent blowing away.

An occasional deposit of pipe clay may be encountered in certain sandy sections, as at Hutchinson, Kans. The treatment of this material differs somewhat from that given to the other types of clay mentioned above. It should be placed upon the road and covered with sand, as described for gumbo, but the difference consists chiefly in the difficulty experienced in the endeavor to incorporate sand with clay. It has a remarkable tendency to remain in lumps and to resist all efforts to pulverize it or to puddle sand into it. It usually requires a great deal of time and labor to mix sand with pipe clay to the proper point of combination. A dozen herds of cattle driven over the road are needed to effect a proper combination; perhaps a thousand sheep would effect the proper puddling of pipe clay more easily. Aside from this difference there is one other point well worth noting regarding pipe clay. It shows this tendency to form lumps when dug or plowed up in the pit. If these lumps are not broken before they are dropped on the road it is very difficult to produce a proper clay bed with an even and uniform thickness overlaying the sand. Eventually these lumps will cause inequalities in the surface. Considerable care should be exercised to have the pipe clay as finely divided as possible when placed on the road, so that it can be spread evenly.

It should not be forgotten that sand is needed in considerable quantities for pipe clay and that the proper time to add it is when the clay is in a muddy state and being puddled.

Sand-Oil Covering for a Sand-Clay Road.—At Garden City Kans., oil was tried on a section of a very sandy road, and it had been planned to parallel the oil with gypsum sand-clay. The suggestion was made that this oiled sand might with advantage be spread evenly over the finished part of gypsum sand-clay. So far this is an untried experiment and results are not known, but the object is to provide a dustless covering to the gypsum road, resisting both wind and rain. It might possibly have the additional effect of providing a cushionlike protection to the hard surface below. Thus the three things which might result in the betterment of the road are a dust preventive, a wind and water resistant, and a cushionlike effect to relieve the impact of travel and thereby prolong the life of the road. At Garden City, Kans., the sand is already saturated with the oil, and the experiment may be tried with little or no cost.

It is well known that the successful use of oil in road building depends largely upon the nature of the materials used. Natural oils vary widely in their characteristics and the same may be said in regard to tars. The possible use of bituminous materials in connection with sand-clay construction must be worked out experimentally before definite instruction in regard to it can be given.

SPECIFIC EXAMPLES OF SAND-CLAY CONSTRUCTION AND COST DATA.

Experimental sand-clay roads were constructed under the direction of the U. S. Office of Public Roads at Garden City Kans., Dodge City, Kans., Bucklin, Kans., and Ford, Kans., and the following is a brief description of the methods employed in the construction of these roads:

Garden City, Kans.—The road selected at Garden City was a part of the Santa Fe road leading south from the station. The work was begun at the foot of the sand hills on the southern side of the Arkansas river. From the starting point the grade rose about 6 per cent, or perhaps a little more, for a distance of about 500 ft., and then ran level for some distance. To give this heavy grade a hard surface was of the utmost importance, because it was impossible with the funds available to reduce the grade, and a change of location was out of the question.

About 300 yds. east of the road a deposit of gypsum clay was found and uncovered, and from this pit were taken 68 cu. yds. It was abandoned because of the heavy sand between the pit and the road, and for the additional reason that the sand could be stripped from a gypsum deposit near the road and material obtained there more cheaply. This pit was immediately on the roadside and promised sufficient material for the completion of the contemplated section. It proved a wise decision to use this pit, for it was found that it improved in quality as the excavation became deeper. It showed greater tenacity and bonded much better than that from the first pit.

Because the road was practically level in the cross section, no preparation at all was made in the subgrade, except to stake out the center and side lines in order to guide the teamsters in hauling. The proposed width was 12 ft. of clay, and for this width a full load was dropped on either side of the center and a half load in the middle between the side loads. The whole was spread as evenly as possible by hand and hauled over as fast as it was spread. All weak and defective places were reinforced as soon as they appeared, and the proper crown was formed as the work proceeded. An effort was made to add the clay to a depth of about 9 ins. and a width of 12 ft., but, since there were no shoulders and since 12 ft. made too narrow a road, the material was allowed to spread to 14 ft., so that the clay tapered off 12 ins. on the sides. In this simple manner the entire section of 765 ft. was constructed. The operation so far consisted simply in hauling gypsum clay and spreading it evenly on the road in a straight line and to an even depth and width. During this time the public was allowed undisturbed use of the road and was even invited to use it for the purpose of packing the surface.

After this packing was accomplished, fortunately a very heavy rain fell and effectually saturated the clay and the sand beneath it. The road was then harrowed with a toothed harrow to break all the lumps on the surface and to prepare it for the sand which was next to be added. For the sanding a heavy 2-horse turning plow was used, and the sand was backfurrowed up to the clay on both sides. A common drag was then used to pull the sand

upon the clay and the harrow was used to mix them. Finally, after several draggings and harrowings, the road was left for travel. After one year the same road was visited and was found to be as firm and hard as macadam. The people are so well pleased that they have continued the construction entirely across the sand southward for a distance of seven miles. A summary of the data regarding this and ten other roads will be found in Table I.

Dodge City, Kans.—At Dodge City a part of the Minneola road was selected. This road, like the one at Garden City, was south of the Arkansas river in the sand hills. The sand here made so serious an obstacle that the road was little used, and travelers preferred to go a mile or more out of the way to avoid it. A search for clay revealed, near the middle of the section to be improved, a deposit of sediment from an irrigation ditch. This deposit was about 18 to 20 ins. thick and extended over an area of 3 or 4 acres. It was decided to use this material, because it was the only thing at hand. Accordingly it was plowed as deep as two horses could pull the plow. It was then found to be dry enough to granulate perfectly, and consequently it was in fine condition for loading into wagons and spreading on the road. The loading was done by hand and common farm wagons were used. For the wagon boxes the material used was 2 by

This method proved the most satisfactory of all. By this means all high places on the roadside were graded, and the sand thus obtained was used to cover the clay. The use of the drag scraper was found far more expeditious than hand work. No roller was used on this work, but the travel was so distributed as to roll every portion of the road evenly.

The road has shown its ability to withstand travel and has converted what was formerly a little-used road into one of the most heavily traveled roads leading into Dodge City. It has clearly demonstrated the value of a good road. Formerly the farmers who had to travel along it were seriously considering the advisability of selling their farms and going where the roads were better. Now they easily haul 60 bushels of wheat with a 2-horse team.

Bucklin, Kans.—Simultaneously with the work at Dodge City, a section of an experimental road, five miles north of Bucklin, was constructed. The section laid out was supposed to be 1½ miles long, and the plan of construction was identical with the work at Dodge City. For the material for giving a hard surface there was no artificial lake of sedimentary clay as at Dodge City. At first it was thought that it would be necessary to haul all the material from the river valley up the hill, but the inspection of a basin on the summit of the hill, near the south end of the

of this condition, the gumbo-clay found in the river valley was plowed up in the afternoon when it had thawed out. The next morning the clay plowed the previous afternoon would be in frozen lumps as hard as stone. The men used gloves and threw these frozen lumps into the wagon by hand, as they would have done stones. In this rough state it was hauled upon the road and spread as well as possible. It was impossible to give a surface to the road until it had thawed in the afternoon. Then it was smoothed to some extent and the clay was covered with sharp sand 3 ins. deep. Certainly no more crude form of construction could have been followed but conditions were such as to prevent the use of any other method. This section was only a short approach to a bridge. The approach was a heavy sand bar, and had to be raised with sand 2 ft. or more in places in order to make the grade easy.

These four experimental roads were constructed with local material and local conditions were met at the least possible cost. The cost figures for each of these roads will be found in Table I. It is believed that a careful study of local conditions in any community will reveal many possibilities for improving the roads at a comparatively small cost. Where work of this kind is undertaken it may be well to make several experiments and tests and to

TABLE 1.—COMPARATIVE COSTS OF FOUR SAND-CLAY ROADS CONSTRUCTED IN 1908.

Place.	Garden City, Santa Fe Road. Oct. 12 to 20.		Dodge City, Minnesota Road. Oct. 22 to Dec. 10.					Bucklin, Spearville Road, Nov. 21 to Dec. 24.			Ford, Spearville Road, Dec. 17 to 21.

*Depth of clay and sand composition. †Length clayed; road was laid off for length of 8,121 ft. **Plowing and loading clay. ‡Sanding clay.

4 in. scantling for the bottom and 1½ by 10 in. planks for the sides; all were 11 ft. long. Two by 6 in. scantling is perhaps better for the bottoms than the dimensions given above, because this size requires less handling.

The preparation of the subgrade was made in advance of the clay hauling and was done in the following manner: Unlike the work at Garden City, a subgrade of definite form and width was prepared. The center line was first laid out and backfurrowed in the manner previously described. The specifications previously noted were also followed in dropping and spreading the clay. During the construction there was no rain and dust formed an inch or more deep. Into this a large amount of sand was harrowed, and the road was finally covered with a layer of sand in preparation for rain. When the rain came the sand was completely absorbed by the clay and an additional application was required to overcome the tendency to stick. This was added after each rain and worked in as opportunity allowed. The clay also cracked quite deeply when it dried out, and to meet this contingency more sand was added and worked into the cracks with the drag. Shoulders were plowed up on either side in the same manner as at Garden City, and sand was pulled upon the clay with a two-horse grader. A large grader was also used to dress the road and to pull sand upon the clay; but still better was the drag scraper for sanding the clay.

section, indicated the possibility of a fairly good material, which, if it should have the necessary binding power, might mean a great saving in the cost of construction. From this point a haul downhill could be obtained, and from the importance of this matter it was deemed worthy of trial. Some of this material was plowed up and put on the road. This surface material at first showed a tendency to blister, and its binding power seemed very slight, but as the depth of the pit increased a decided improvement was apparent and excellent material was found beneath the surface soil. A great saving in the cost of construction, well worth the experiment, was thus accomplished.

At the south end of the road, 3,276 ft. of road were clayed from the clay pit described above. This was a haul down hill, and the material was spread on heavier than is usually done because it seemed likely that it would not support the travel. The work was then stopped at the south end and begun at the north end of the section. At this end 995 ft. were clayed and, when a bed for clay in the intervening space, which was about 2,500 ft. long, had been prepared, it was left for the community to clay according to the plan given them.

Ford, Kans.—The construction at this place was quite peculiar, because of the weather conditions. During the night the road would freeze hard, and, in order to take advantage

note the difference in the results. In all forms of sand-clay construction the process requires the final mixing to be in the wet state, as otherwise there can be no bond. It is also of the utmost importance to use the drag frequently on the road during the first year, and as often as any part shows a tendency to stick or pick up it should have a surface coating of sand to prevent the clay from being carried off. It is necessary to study the needs of the road by actual observation rather than to endeavor to learn them from printed rules. Local conditions must be studied and overcome on their own ground.

The Turkish Government has granted a concession to Americans for building a railway from Sivas to Dvarbekir, Betlis and Van, in Turkey, a distance of 1,500 miles. Manning, Maxwell & Moore, 85 Liberty St., New York City, are reported to have the contract for constructing the line.

The Legislature of Rhode Island has passed the bill chartering the Southern New England Ry. This is the road backed by the Grand Trunk Ry., and by means of it the latter will secure an entrance to Providence, R. I. Surveys for the line are to be made at once, it is said. H. G. Kelley, Montreal, Que., is Chief Engineer.

Railway Section

Note: This section is devoted to methods and costs of constructing railways. It will cover road-bed and track construction, contractor's plant and organization, surveying methods and permanent way structures.

Traffic Conditions Influencing Passenger Subway Construction in Chicago, Ill.

Final studies and perfected plans for the construction of passenger subways in Chicago are being made under the direction of Mr. Bion J. Arnold as chief engineer. It is too early to do more than surmise what these plans will be or to assert that they will be followed by immediate construction; we only know that the necessity is too pressing to permit of long postponement of definite action toward a comprehensive improvement of passenger transportation facilities to and from the business center of the city. It is with this idea that we propose in this and a succeeding article to present in outline, first, what the traffic conditions are that influence passenger subway construction in Chicago, and, second, the various plans that have been so far proposed for locating and constructing passenger subways.

Present Transportation Facilities.—The present passenger transportation facilities to and from the business district of Chicago consist of surface and elevated railways. The surface railways are all electric overhead trolley lines and the elevated railways are third rail electric lines. Figure 1 is a skeleton map of the city showing these lines. It will be noted that all the elevated lines converge into a loop line. The route of this loop line, starting from an arbitrarily selected point at the intersection of Van Buren St. and Wabash Ave., is west along Van Buren St., north along Fifth Ave., east along Lake St. and south along Wabash Ave. to the starting point. It is roughly 7 full city blocks from north to south and 5 city blocks from east to west. The 35 or more city blocks within the loop and those skirting its outer perimeter constitute what will be designated here the business district or loop district of the city; they contain most of the large office buildings, retail stores, hotels, theaters, etc. Practically all the surface railways as well as the elevated roads converge in the loop district; it will be seen therefore that the conditions here for congestion of traffic are exceptional. As a matter of fact such congestion exists to a marked degree, as will be shown further on. First, however, it is instructive to examine the character and amount of traffic which comes into the loop district from the surface and elevated lines and which has to be handled there.

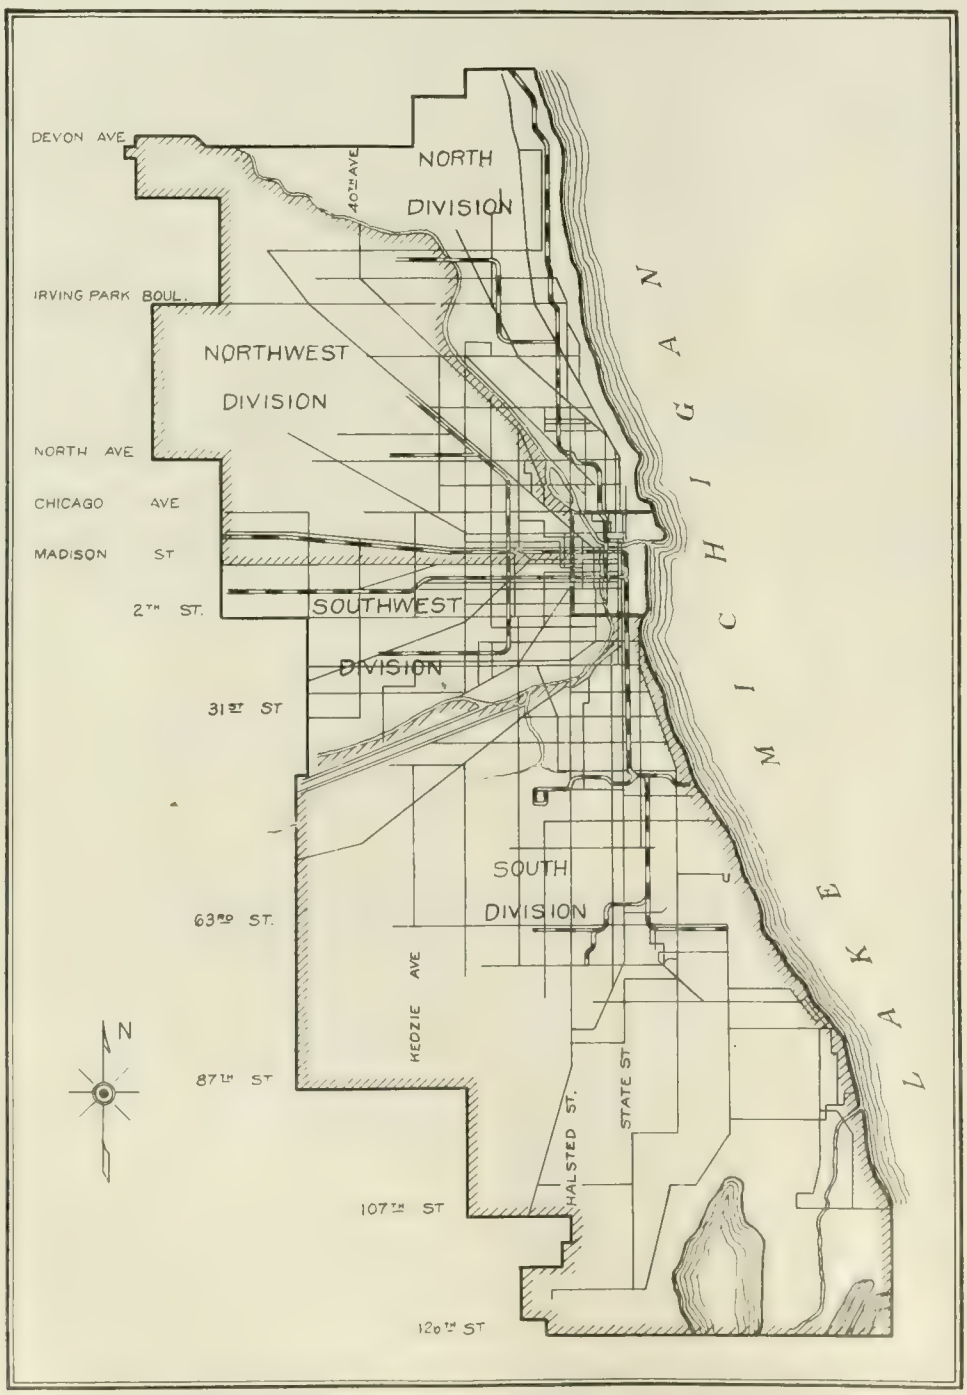

Fig. 1—Diagram Map Showing Surface and Elevated Railways of Chicago, Ill.

Elevated Railway Traffic Into Loop District.—The elevated railway lines of Chicago are shown by the map, Fig. 1. To simplify the study of the traffic of these lines the city is divided into four divisions as indicated. These divisions show as clearly as may be the distinctive traffic territories tributary to the different lines. A traffic census of elevated railway traffic into and out of the loop district for 24 hours was made in February, 1909, and the results are shown by diagram in Fig. 2 and in the following text. The observations were taken at the boundaries of the business district assumed as within the area bounded by Twelfth St., Halsted St., Chicago Ave. and Lake Michigan.

The total elevated railway traffic during the 24 hours recorded was as follows:

Line.	Inbound No. Pass.	Outbound. No. Pass.
Metropolitan	61,896	57,415
Northwestern	54,247	50,606
South Side	51,478	47,207
Oak Park	20,421	19,662
Total	188,042	174,890

Arranging this traffic according to the maximum ¼ hour and 1 hour periods the results were as follows:

Line.	Inbound. ¼-hr.	Inbound. 1-hr.	Outbound. ¼-hr.	Outbound. 1-hr.
Metropolitan	7,730	25,667	8,062	23,056
Northwestern	5,486	17,090	5,245	17,279
South Side	3,961	12,657	4,685	15,137
Oak Park	2,280	6,663	2,546	7,312
Totals	19,466	62,077	20,538	62,784

It will be observed from Fig. 2 that the inbound period of heavy traffic was between 6:30 and 9:45 a. m., and the outbound period was between 4 p. m. and 7 p. m.

The number of trains handling the elevated railway traffic for 24 hours and for the maximum hour of the 24 was as follows:

Item.	Inbound.	Outbound.
For 24 hours	2,187	2,201
For maximum hour	215	194

To illustrate the accommodations afforded passengers, records were taken of the number of passengers standing; the totals were as follows:

Standing in 24 hours (both directions)....48,371
Maximum standing during one hour.....19,664

Surface Line Traffic Into Loop District.—In studying the traffic on surface lines the same divisions of the city into traffic territories was assumed as in studying the elevated railway traffic, Fig. 1. A traffic census of the surface lines was made in March, 1909, to determine the number of passengers brought into the loop district for 24 hours. The results of this census are shown by the diagram, Fig. 3, and in the following text.

The total traffic for 24 hours was as follows:

Division.	Inbound. No. Pass.	Outbound. No. Pass.
North	54,401	58,014
Northwest	69,177	71,987
Southwest	37,236	48,235
South	92,387	103,458
Total	214,201	280,794

The maximum traffic periods of the ¼-hour and 1-hour were recorded and gave the following figures:

Division.	Inbound. ¼-hr.	Inbound. 1-hr.	Outbound. ¼-hr.	Outbound. 1-hr.
North	2,989	10,330	4,026	15,215
Northwest	4,150	12,893	5,468	18,834
Southwest	2,533	8,831	3,958	14,018
South	5,359	17,410	6,689	23,644
Total	14,870	50,074	19,443	69,919

The period of heaviest inbound traffic was

between 7 and 9 a. m. and of heaviest outbound traffic between 5 and 6:30 p. m.

The number of cars handling this traffic was for the 24 hours and for the hour of maximum traffic as follows:

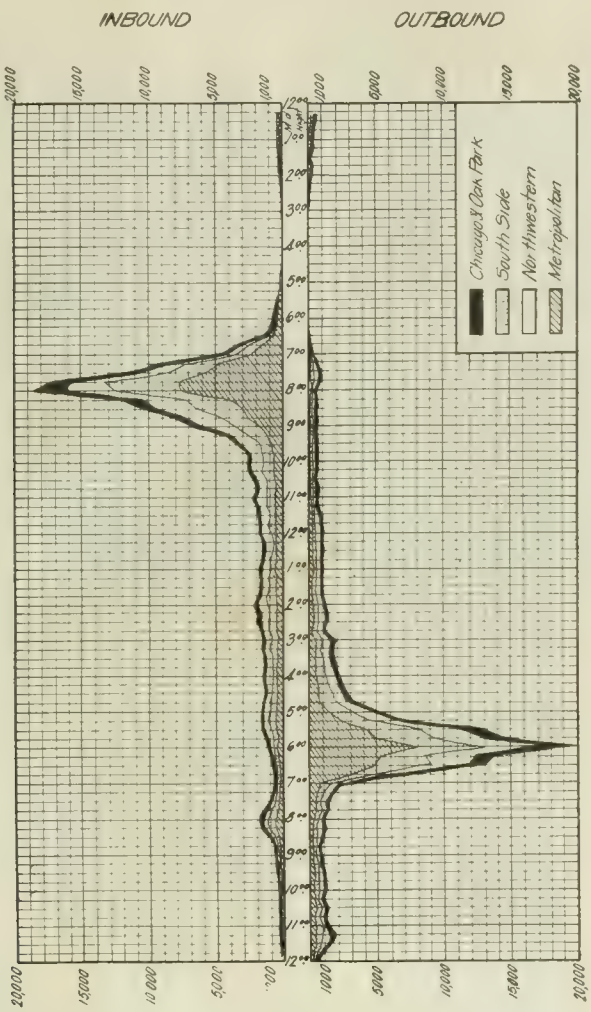

Fig. 2—Diagram Showing Fluctuation of Traffic on Elevated Railways for 24 Hours.

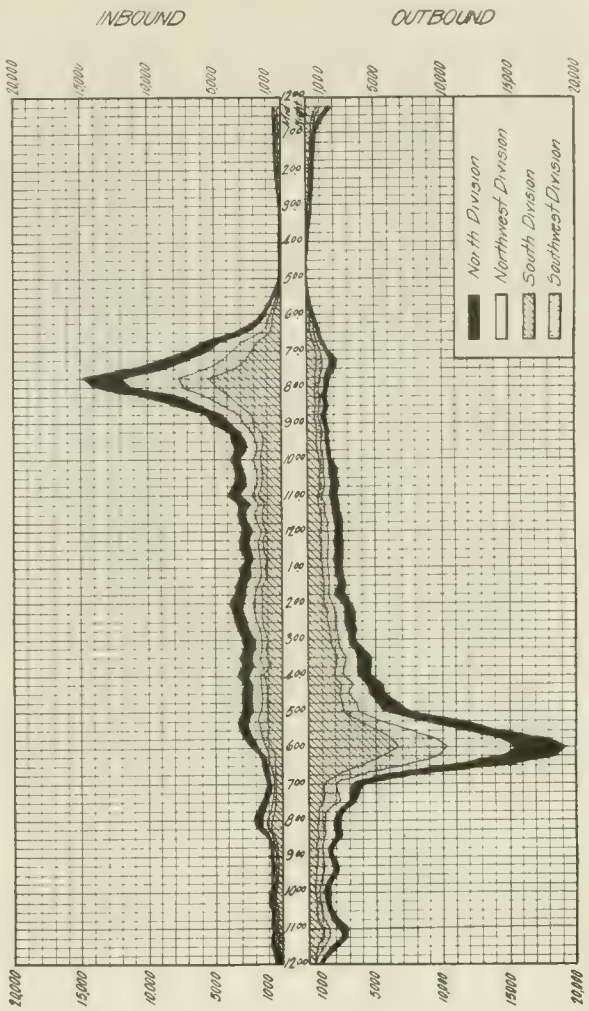

Fig. 3—Diagram Showing Fluctuation of Street Railway Traffic for 24 Hours.

Item.	Inbound.	Outbound.
For 24 hours	12,015	12,152
For maximum hour	909	959

The number of passengers standing for the 24 hours and for the maximum hour was as follows:

For 24 hours (both directions)	88,490
For maximum hour	35,526

Congestion Within the Loop District.—The preceding data indicate the amount, distribution and intensity of traffic entering the loop district and having to be cared for there. It will be observed that we say these data indicate—not that they show definitely. They were closely accurate at the time they were recorded a year ago, but the traffic has increased during that year and is constantly increasing. Remembering this we may study now the conditions of congestion which resulted from the traffic as recorded.

First in order is the elevated railway traffic. Practically all the elevated trains pass around the loop which is a two-track line. The South Side and the Metropolitan trains use one track and the other is used by the Northwestern and the Oak Park lines. There are 11 station stops on the loop. The total length of the loop is miles. Then on this miles of double track there must be handled some 2,000 trains every 24 hours and for short periods twice a day some 200 trains per hour, these trains nominally making all station stops. The condition of traffic congestion on the elevated loop is obvious from these general figures without further analysis.

Turning now to the surface car traffic within the loop district, it is evident that this traffic must be considered from the point of view of its congestion in connection with the vehicular traffic of the district. It is also

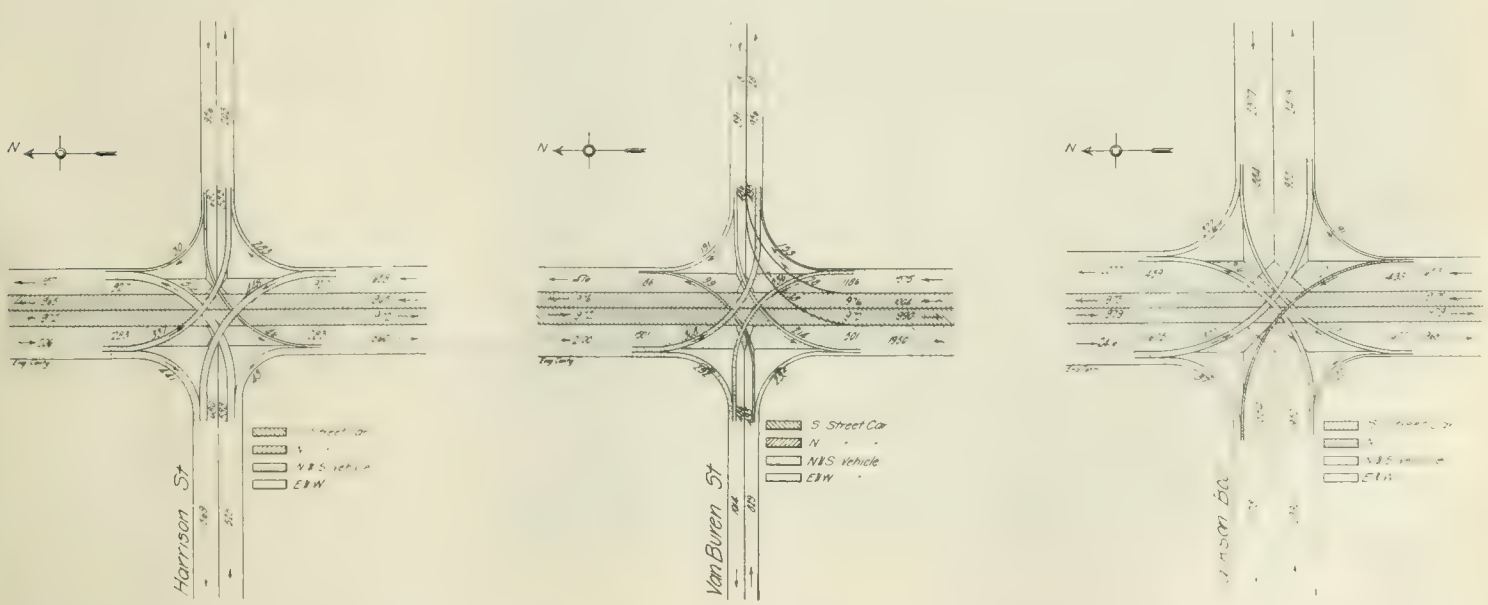

Fig. 4—Diagram Showing Direction, Character and Density of Surface Traffic in the Loop District.

evident that complete statistics of traffic by vehicles and cars within the loop district are nearly impossible to obtain. An idea of its intensity may be gained, however, by selecting certain points and recording this traffic movement at those points for a definite period of time. Selection has been made of State street, where it is crossed by various east and west streets and the vehicle and car traffic recorded for 12 hours from 7 a. m. to 7 p. m. for seven days in April, 1909. The results of this traffic census are shown by the accompanying diagrams, Fig. 4. In studying these diagrams it is to be noted that the points selected were ones at which the crossing streets had no car lines so that they would show the maximum congestion.

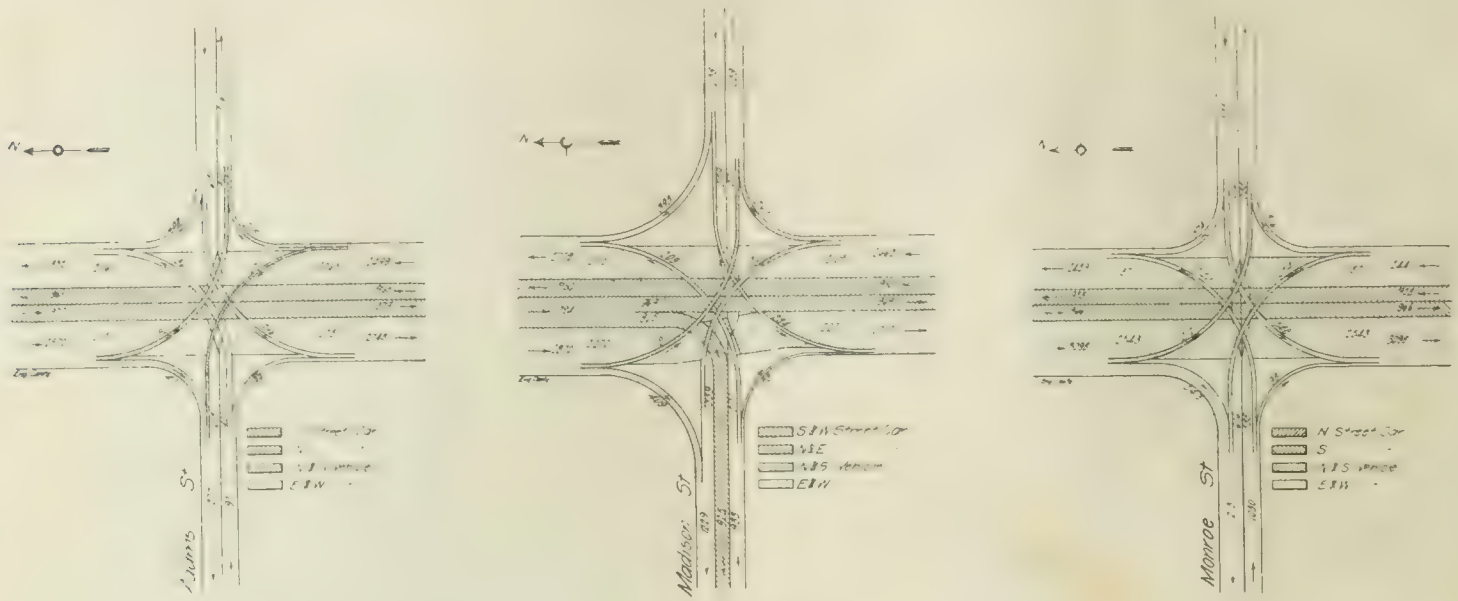

Fig. 4—Diagram Showing Direction, Character and Density of Surface Traffic in the Loop District.

At all the crossings shown by the diagrams of Fig. 4 the traffic is regulated by the police. This is the practice at all of the busier street crossings in the loop district. Broadly, the method of procedure is to close the crossing alternately against north and south and east and west travel. The time interval for which the crossing is closed in either direction of travel is determined by the police officer in charge depending on the relative pressure of traffic in the two directions. The diagram Fig. 5 shows the sum of intervals during 12 hours when traffic was permitted to pass without regulation at night, and under regulation the effect of such accident there are shown the pictures taken at the crossing of Randolph and Dearborn streets during the busy part of the day. Figure 6 shows the crossing under normal conditions with traffic under regulation. To obtain Fig 7 the police officers were instructed to disappear for 5 minutes, allowing traffic to take its own course; the view shows the conditions at the end of the 5-minute interval.

Fig. 5—Diagram Showing Movement of Traffice Crossing State St., Chicago, During 24 Hours.

Conclusions and Discussion.—The preceding records of traffic conditions are instructive first as demonstrating the necessity for substructure and by revising the methods of operation to improve conditions somewhat, but the possible improvement is so small that it does not satisfy the demand. The only other possible resort is elevated stub terminals, but they serve only those passengers whose destinations are near them. In respect to the surface lines there is still less hope of improvement. It is not lack of track facilities in the loop district that accounts for the slow movement of cars through the district; it is the delays to which they are subjected by vehicle traffic, by open bridges, etc. This vehicle

The foregoing statistics relate to the movement of traffic during normal conditions when it is not retarded by accident. To illustrate

way lines. They show that the capacity of the elevated lines entering the loop district is limited by the capacity of the loop and the capacity of the loop has been reached. It may be possible by physical changes of the loop

traffic is increasing and as it increases the interruptions to surface car traffic increases. The necessity for subway construction is imminent.

A second point of interest in the traffic records given above is the information they give of the relation between total traffic and rush-hour traffic. This relation is somewhat different than has been found in other cities. In most cities it has been found that the traffic of the heaviest hour is roughly one-sixth of the total traffic of one day. This is slightly more than 16 per cent. From the figures given above it will be found that in Chicago the corresponding percentages are as follows:

	Inbound. Traffic.	Outbound Traffic.
Elevated lines	33%	36%
Surface lines	20%	25%

The influence of variations such as this upon questions of subway capacity is evident.

In conclusion, we wish to note that the records given above are not necessarily those which will be used in working out the plans for a Chicago subway system that the city's engineer now has in hand. They are presented simply as a review of the work previously done in this respect to indicate the character of the traffic conditions which influence subway construction. In a succeeding article we shall review briefly the several plans that have been worked out during the last few years for subway routes and structures.

View of Corner of Washington and Dearborn Sts., Showing Condition of Traffic Under Regulation of Police.

Cost of Operating the Manhattan Elevated Railways.

The Interborough Rapid Transit Co. operates both the New York City Subway and the Manhattan Elevated Railway. The latter is operated under a lease. The first cost of the subway and the cost of operating it were given in our issue of April 13. In this article we give the cost of operating the Manhattan Elevated, for the fiscal year ending June 30, 1908.

The road extends from South Ferry to 159th St. on the west side and to Bronx Park on the east side. The mileage is as follows:

	Miles.
1st track	37.68
2d track	37.68
3d track	15.30
Other tracks	27.39
Total tracks	**118.05**

The first cost of this railway is not exactly ascertainable, but it can be approximated with considerable accuracy from actual detailed costs of many miles of elevated railways in New York and Brooklyn, given in the 1910 edition of Gillette's "Handbook of Cost Data."

This elevated line was originally operated by steam locomotives.

In 1901 an order was placed for an electric power plant to operate the elevated railways on Manhattan. There were 8 engines ordered, rated at 8,000 HP. each, total 64,000 HP., to operate generators having a total rated power of 40,000 K. W. The rolling stock ordered was 800 motor cars and 400 trailer cars, and the electric equipment for these 800 motor cars was reported to have cost $3,000,000, or $3,750 per motor cars, which does not include car bodies and trucks.

In 1908 the Manhattan Ry. Co. built and equipped 84 motor cars at a cost of $10,110 each, and 116 trailer cars at a cost of $5,240 each. In its report for June 30, 1907, the company stated that it had 836 motor cars, 669 trailer cars without motors, and 50 service cars (without motors), or 1,555 cars. The 50 service cars were reported to have cost $1,322 each, and the 1,505 remaining cars were reported to have cost $6,732 each, on the average. It would appear that some of the trailer cars were retired in 1908, for the total reported June 30, 1908, was 916 motor cars and 675 non-motor cars. From these data it appears that the rolling stock must have cost but little more than $11,000,000. Since 64,584,609 passenger car miles were reported for the year, we see that the first cost of the equipment was about 17 cts. per annual million car miles, which is considerably less than the corresponding cost of equipment for the Subway.

If we assume that this elevated system could be reproduced for $150,000 per mile of single track (see Gillette's "Handbook of Cost Data"), the total first cost of construction (not including power plant or rolling stock) would be less than $18,000,000. The company reports real estate to the amount of $2,776,724, but its report does not give the cost of the power plant. Exclusive of the power plant, the land and the electric transmission line, the total cost of reproduction would be about $29,000,000 or $30,000,000.

The company reports its "cost of road and equipment" at $95,443,757, but this, in common with all other similar reports, really represents capitalized value, and does not indicate in the remotest degree what was the actual cost of construction and equipment.

The Interborough Rapid Transit Co. reports electric generators having a total of 85,000 K. W., plus 10,250 K. W. for turbo-generators. This power includes both that used for the Subway and for the Manhattan Elevated Railway. Since a 55,000 K. W. plant was provided for the Subway, it would appear that about 40,000 K. W. are required for the Manhattan Elevated, in spite of the fact that nearly 50 per cent more car miles are required on the Elevated than on the Subway. However, the report shows that the cost of fuel was less than 7 per cent more to operate the Elevated lines than the Subway. Unfortunately the Interborough Co.'s report does not give the number of K. W. hrs. used by each, but only the grand total, which was 391,904,000 for both the Elevated and the Subway. There were required 2,385 lbs. of bituminous coal per K. W. hr.

The cost of operating the Elevated was as follows for the year 1908:

	Maintenance of Way and Structures:	
1.	Track and roadway	$ 560,312
2.	Electric line	68,517
3.	Buildings and fixtures	117,841
4.	Undistributed expense	44,926
	Total maintenance of way	$ 791,596
	Maintenance of Equipment:	
5.	Steam plant	$ 101,267
6.	Electric plant	32,929
7.	Cars	341,854
8.	Electric equipment of cars	220,645
9.	Miscellaneous equipment	314
10.	Shop expenses	133,453
11.	Undistributed expense	24,697
	Total maintenance of equipment	$ 855,158
	Operation of power plant:	
12.	Wages	$ 209,672
13.	Fuel	729,992
14.	Water	62,078
15.	Lubricants and waste	14,432

Fig. 7—View of Corner of Dearborn and Washington, Showing the Results Due to Non-regulation of Traffic for Five Minutes.

16.	Miscel. expenses and supplies.....	51,920
17.	Undistributed expense	44,194
	Total operation of power plant....	$1,112,288
	Operation of Cars:	
18.	Superintendence of transportation.	$ 31,511
19.	Wages of conductors	1,080,236
20.	Wages of motormen	414,433
21.	Wages of miscel. car service men.	262,410
22.	Wages of car house men.....	68,714
23.	Car service supplies.....	32,453
24.	Miscel. car service expense.....	59,336
25.	Hired equipment	749,736
	Total operation of cars	$2,728,828
	General Expense:	
26.	Salaries of general officers and clerks	$ 275,442
27.	Printing and stationery	15,450
28.	Miscel. office expense	33,249
29.	Miscel. general expense.....	65,294
30.	Damages	222,784
31.	Legal expense due to damages	49,341
32.	Miscel. legal expense	107,016
33.	Insurance	42,934
	Total general expense	$ 811,510
	Grand total	$6,299,381

Since this expense applies to 64,584,600 car miles, the cost per car mile is closely ascertained, in cents per mile, for any of the above items of operating cost by multiplying the cost (expressed in millions of dollars) by 1.55. This gives us the following summary of cost:

	Per car mile, etc.
Maintenance of way and structures.....	1.22
Maintenance of equipment and power plant	1.33
Operation of power plant	1.72
Operation of cars	4.23
General expense	1.26
Grand total	9.76

There were 547,095 car miles per mile of all-tracks, or 712,000 car miles per mile "tracking" (1st, 2d and 3d track). The average speed of cars was 14.91 miles. Each passenger averaged 43,050 miles during the year.

Maintenance of cars and electrical equipment on cars cost $562,499, but this does not include $158,150 of "shop expense" and "undistributed expense," about 70 per cent of which should apparently be charged to maintenance of rolling stock. It would seem, therefore, that maintenance of rolling stock cost about $675,000, which is only about 6 per cent of its first cost. This percentage will unquestionably increase greatly as the equipment grows older.

Item 25, "Hired Equipment," is an unexplained item, and is astonishingly large. Since no rolling stock other than that above described was in use, this Item 25 seems to be a matter of bookkeeping rather than of actual operating expense.

The very great cost of damages and legal expense is noteworthy.

Item 1, "Maintenance of Track and Roadway," amounts to $560,312, which is equivalent to $4,745 per mile of all-tracks. This seems, at first sight, like an exceedingly high cost. It should be remembered, however, that rail renewals under this enormous traffic must necessarily be very heavy. What rail renewals amounted to in 1908 is not reported, but in 1907 there were 21.4 miles of rails relaid in repairs, which is 23½ per cent of the operated "trackway" (1st, 2d and 3d track). If this were a fair average, it would indicate a life of rail equivalent to about 4¼ years, under a traffic of 712,000 car miles per mile of "trackway," or a total life of about 3,000,000 cars over each rail. If, however, we take all track (118 miles), the renewals were about 18 per cent, under a traffic of 547,095 car miles per mile of all-track. It is to be hoped that future reports will give the miles of rails in track relaid annually, so that accurate statistics as to rail wear under these conditions will be available.

The deduction is made in Gillette's "Handbook of Cost Data" that the average life of rails on steam roads in America is 1,600,000 cars, counting an engine and tender as equivalent to two cars.

Valuation of the Railways of Texas.

According to the report of the Railroad Commission of Texas for 1909, the total railway mileage was 12,373 miles of roadbed (or line) as of Oct. 31, 1909. The cost of reproduction new was estimated to be:

TABLE I.—VALUATION OF THE BEAUMONT & GREAT NORTHERN RAILROAD.
Trinity to Livingston, 33.45 miles.

Class Items.	Value.	Total value.	Value per mile of line.	Per cent.
Real estate—				
Right of way	$ 14,958.40			
Depot grounds	6,791.00			
Gravel lands	563.00	$ 22,312.40	$ 667.42	3.4
Graduation—				
Clearing and grubbing	18,318.15			
Earthwork	85,394.14

Telegraph line (33 miles)	1,650.00	1,650.00	50.00	.3
Buildings—				
Passenger depots	2,250.00			
Freight depots	2,400.00			
Cotton platforms	150.00			
Section house	1,600.00			
Water stations	2,750.00			
Stock pens	400.00			
Coal chutes	500.00			
Tool house	35.00	10,085.00	301.60	1.6
Miscellaneous structures—				
Track scales	1,750.00			
Cattle guards	615.00			
Fencing	315.00			
Road crossings	262.00			
Signs	137.00	3,079.00	92.00	.5
Rolling stock and equipment	65,195.00	65,195.00	1,950.10	10.2
General property (sheet "C")	64,209.14	64,209.14	1,920.70	10.0
Totals	$639,145.57	$639,145.57	$19,118.92	100.0

	Per mile of line.
Roadbed, etc.	$13,044
General property	2,430
Equipment (rolling stock)	1,751
Total	$17,198

On June 30, 1909, the total track mileage was as follows:

	Miles.
Main line, branches and spurs	13,110.35
Yard track, sidings, etc.	3,231.15
Total	16,341.50

Unfortunately the report does not contain a summary of the detailed cost of reproduction. It is the practice of the Commission merely to report the detailed costs of lines valued during the preceding year.

Table I is fairly typical of the lines appraised, as of June 30, 1909. This line was 33.45 miles long, with 3.50 miles of yard track and sidings, making a total of 36.95 miles of track.

It will be noted that the appraised value of Texas railways is very low. (For comparison with the values of railways in other states, see the 1910 edition of Gillette's "Handbook of Cost Data.") Even the value of the rolling stock is abnormally low, being only $1,751 per mile of line. It is true that the traffic on Texas railways is light, but not as light as might be inferred from the low value placed on the rolling stock. For the year ending June 30, 1909, there were 426,931 ton-miles of freight per mile of line, which is about 45 per cent of the average for the whole United States. There were 3,220 train-miles per mile of line, which is equivalent to 8.8 trains per day both ways, or 4.4 trains each way, and this is about 75 per cent as many as the average for the United States. Therefore the value placed on the rolling stock appears to be considerably below half its cost of reproduction new, if the criteria furnished by valuations in other states are at all applicable.

Preliminary surveys have been started from Caldwell, Idaho, by Harold Williams, City Engineer of that place, for an electric railway to Roswell.

Method and Cost of Constructing Street Railway Track with Grouted Crushed Stone Foundation.

The following data are given by Mr. H. L. Weber, Chief Engineer, Columbus, Marion & Bucyrus Ry., Marion, O., in a paper presented to the Central Electric Railway Association, March 24, 1910:

A section of reconstructed track with a grouted, crushed-stone foundation was laid on Taylor St., Fort Wayne, Ind., in 1908, and I am informed by Frank M. Randall, city civil engineer, that the work is holding up well. The track was a single line, laid with 73-lb., 6-in. rail. During reconstruction it was necessary to excavate the street from 1 ft. to 3 ft., remove the old ties and rails and install the new material. During this work 50-ton interurban cars used the track under a 1½-hour schedule. There were also extra limited and express cars and a small city car service under a 15-minute headway. The city car service was at times delayed a few minutes, but the interurban cars had simply to operate under a slow order. A sufficient number of the old ties were removed so the excavation could be expeditiously done, and enough new ties were added to hold the rails to gage and make it safe under slow running. The tracks were then let down to the subgrade.

A trunk sewer had previously been constructed through a portion of the street. This portion was sub-drained with a 3-in. tile. All trenches were examined and if soft places were found or developed after a rain, they were filled with suitable material and rammed with the ordinary 45-lb. paver's rammer, manipulated by two laborers.

The outside of the rail, against the web, was filled in advance of the paving with a stiff concrete in the proportions of 1 part cement and 4 of sand. The 8 ins. of stone were put under the track in two 4-in. lifts. When the stone was in place, all the old ties were removed and the new ones were put in position. New rails were then laid. The track

was then thoroughly tamped to grade four times. The men commenced at one end and continued through the entire length of the line, and a close watch was kept on all portions for apparently soft places. When the tamping was completed the crushed-stone foundation was thoroughly grouted for a distance of 15 ins. on each side of each rail with a Portland cement grout of 1 part cement and 4 parts good sharp sand.

Over the sewer trench 6 x 8-in. x 8-ft. ties were used, for the rest of the track 6 x 8-in. x 7-ft. ties. At the suspended joints the ties were placed 20 in. centers. There were 30 ties to each 60-ft. rail, making the spacing practically 24 ins. It will be noticed that one-third more ties, but less concrete, are required by this method of construction. The space between the ties, from the base of the rail to the bottom of the ties, was filled with a very soft concrete, consisting of 1 part Portland cement, 2½ parts sand, 2½ parts gravel, the gravel containing the sand and 5 parts crushed stone. The concrete was thoroughly puddled so as to fill under the base of the rails and around the ties, thus giving a bearing surface equal to twice that of the ties. The space between the rails and for a distance of 1 ft. outside the rails was paved with brick, with a special block on the inside of the rail to form the flangeway. The itemized cost of the work is given in Table I.

TABLE I.—COST OF STREET RAILWAY TRACK.

Track work and material—	Per lin ft. of track.
Labor laying track and one-half excavation	$0.413
Ties	0.274
6-in., 73-lb. steel rails	0.700
Rail and cross bonds (compressed)	0.012
Bolts	0.004
Spikes	0.004
Splice bars	0.055
Total cost of track work per linear foot	$1.462
Track foundation, 8-in. crushed stone, grouted -	
Labor	$0.129
Stone delivered	0.231
Drain tile	0.011
Cement and sand for grouting	0.035
Total cost of foundation per linear foot	$0.406
Concrete foundation for paving—	
Labor, including one-half of the excavation	$0.336
Stone delivered	0.114
Cement	0.114
Sand	0.028
For use of tools	0.013
Total cost of paving foundation, per linear ft.	$0.605
Brick pavement—	
Labor	$0.111
Metropolitan paving block	0.505
Metropolitan special shapes	0.180
Cement	0.028
Sand	0.021
Track drains	0.005
Mixing boxes, etc	0.004
Total cost of pavement per linear ft.	$0.857
Grand total cost per linear foot	$3.328

Cost of concrete per cu. yd., $4.34.
Cost per sq. yd. of brick paving, including foundation complete, $1.946.
Length of track constructed, 2,332 lin. ft.
Brick pavement, 1,794 sq. yds.

Good Roads Convention in Montana.—A State Good Roads Convention is to be held at Billings, Mont., about June 15-20. Delegates are now being appointed from different sections of the state. The program of the convention has not as yet been completed, but it is expected that speakers of National repute will be present. It is also probable that short stretches of experimental highway will be built during the convention. As a result of this convention it is expected that the next session of the State Legislature will take up the matter of good roads. W. B. George, Billings, Mont., is Chairman of the Arrangement Committee and Mr. E. B. Camp, Billings, Mont., is chairman of the Program and Invitation Committee.

The city of Montclair, N. J., will vote on the expenditure of $1,500,000 for parks and playgrounds. This expenditure is to be spread over the next 10 years.

Unclassified and General Articles

Note: This section is devoted to methods and cost articles on construction work not properly coming under any of the preceding classifications.

A Discussion of the Supporting Power of Piles.*

Piles, whether of timber, concrete, steel or other material, sustain the superimposed load by acting either (a) as columns, more or less restrained; (b) as floats; or (c) as combinations of these two. Their supporting power, in each instance, is due to an entirely different series of phenomena, each of which must be separately considered in any endeavor to predetermine the ultimate supporting power of the pile.

Piles Acting as Columns.—A method of design has sometimes been employed where the bed of a waterway has been found to consist of solid rock, of drilling shallow holes a foot or more in depth, and placing blunt piles in these recesses with their tops carefully swaybraced and capped. The weight of the structure prevents damage from a certain variety of wave or tidal action, while the swaybracing is depended upon to prevent lateral motion and collapse of the structure as a whole. In this instance each pile acts entirely as a column, more or less restrained at or near the head, while the foot is practically free to turn and more nearly approaches the condition of a so-called "round-ended" strut.

In case the rock happens to be overlaid with a thin stratum of comparatively dense material, it is sometimes unnecessary to drill holes into the rock, dependence being placed upon the overlying stratum of soil to prevent lateral motion of the foot of each pile. Where the rock is of a shelving nature, this type of design must be studied with special care, as the slipping of the bottoms of the piles has been known to wreck the structure entirely. In an endeavor to prevent such action taking place, riprap has sometimes been deposited among the piles after they have been driven, but the added weight upon the material overlying the rock has been the probable cause of a subsequent sliding which moved the bottoms of the piles.

Where a stratum of hardpan exists, it serves in practically the same capacity as a rock bottom, so far as affording sufficient support for the piles is concerned. Because the latter are usually made to penetrate the hardpan to a limited extent, they receive some lateral restraint at the lower ends, and need no longer to be computed as "round-ended" members, but may be considered as struts with square ends.

In this connection, attention is called to the fact that the greatest care should be employed in driving piles, which are expected to rest on bed rock or penetrate slightly a stratum of hardpan, in order to prevent shattering or crushing the bottom of wooden or concrete piles, or the permanent bending or curling of the lower ends of metal piles. Otherwise, the supporting power of the member may be seriously impaired. More damage has probably been done by "overdriving" under such conditions than has been caused by settlement or other trouble from underdriving.

When, as is usually the case, the soil is composed of strata of different consistencies, it is customary to endeavor to drive the piles so that their points will penetrate a stratum which is firmer and offers more resistance to driving than those which lie above it. Under such circumstances, the lower end of each pile receives a considerable restraint, varying with the consistency of the soil, and it has been found that wooden piles driven in such soft material as Hudson River silt will break off, in case of trouble, approximately at the mud line. It is evident that such piles may be considered as fully restrained members, so far as the bottom of the pile is concerned, whenever they penetrate a sufficient distance into a firm stratum. Experiments can well be made and experience recited to determine the necessary penetration required to produce full restraint in different soils under different degrees of saturation. Experience with telegraph poles, and the few reported examples of pile failures of this type seem to show that only a relatively short length of penetration is necessary. It would be a very easy matter, where piles are being driven for a trestle across a swamp, with varying degrees of consistency and humidity of the soil, ranging from the firm material on the bank to the soft material at the center, to use a block and fall for actual tests of a number of piles to ascertain the resistance offered in the way above mentioned. The amount of this resistance should be measured, from time to time, over a period of several days, together with the deflection produced at several points along the pile, so as to ascertain the shape of the bent member and deduce its curve at the bottom for each penetration, kind of soil and lateral force.

The amount, stiffness and other characteristics of the swaybracing required near the top of a pile, when driven under each of the conditions above described, has a very great influence on its supporting power, and must therefore always be considered in computing this factor. The usual rules of diagonal bracing for bridge portals are entirely applicable to such conditions. The amount of natural curvature in the pile is also a factor which must be considered, together with the amount of flexure produced after the pile is driven by forcibly drawing the heads over out of their natural locations, to properly line poorly driven piles for capping or other similar purposes. Two-inch new hemp rope in a four-part tackle has been broken in such an effort, and the resulting bending stresses produced in the pile must have been correspondingly large.

Where dependence for the supporting power of a pile is placed upon a deep-lying firm stratum, both theory and experience have shown that the depth of the stratum below the surface has an appreciable effect on the actual supporting power afforded the bottom of the pile. A thorough investigation of the literature on the subject discloses so few experiments and so little information relating to this important topic, that accurate tests are exceedingly desirable, and every opportunity of securing accurate data should be embraced. In order to prevent complications arising through the action of friction on the sides of piles, the tests can probably best be made by first carefully sinking a large pipe, and, after the soil has resumed its natural condition, inserting through this pipe a heavy timber with a blunt cap just large enough to pass through to the earth to be tested. A platform at the upper end of the timber can then be loaded and accurate observations made to determine the compressibility of the soil in amount and rate under different loads. The latter should be alternately increased and decreased to ascertain whether any elasticity exists, and the experiment should be continued over several days or weeks, in order to ascertain whether the special soil under examination possesses any characteristic comparable with the viscosity of certain materials. Pipes and plungers of several sizes should also be employed. The few experiments which have been made, and a study of the records of load tests of piles, seems to show that soils possess each of the three qualities previously mentioned, viz., compressibility, elasticity and viscosity; and it is only after accurate information is obtained regarding each of these three items that the actual supporting power and the amount of settlement, which is to be expected in any given instance, can be computed.

*A paper by E. P. Goodrich, before the American Railway Engineering and Maintenance of Way Association.

The pipe should be sunk by dry methods, and accurate data secured of the weight per cubic foot, amount of humidity, and internal friction coefficient peculiar to each varying depth and kind of soil. Having ascertained these items, a further examination of them by methods similar, for example, to those used by the writer,[2] should be made, with varying amounts of water in combination, to investigate the possible effects which may be expected with changes in the amount of ground water present under any foundation. Piles which were considered entirely satisfactory, driven into a stratum of firm clay, have been known to become displaced to the extent of several feet even after some years of satisfactory service, because of a change in the amount of water in the clay stratum, which caused a marked reduction in its friction coefficient, so that the clay acted as a lubricant, the superimposed strata squeezing it aside and sliding upon it, carrying the piles downward and sideways to varying distances.

Since a pile must displace the soil through which it is driven, the latter must either become considerably compressed or actually move aside to allow the pile to take its proper position. This compression in itself changes the nature of the soil in many instances to such an extent that while piles which have been driven with a large spacing have been found to settle badly, other piles under the same conditions with a closer spacing have been found entirely satisfactory. Reference is now made solely to the action near the point of the pile with regard to the supporting power afforded, and has no relation to the shape of the pile above this point, whether the member be straight or tapered.

For piles which act as columns under any of the conditions above described, the cylinder is probably the most efficient shape which can be employed for separate piles, while square or rectangular sections are best for sheet piling of timber or concrete. In the case of sheet piles, special metal shapes may be employed advantageously, because the supporting power is not involved then to any appreciable extent.

Piles Acting as Floats.—Where a pile is placed so that its tip does not rest upon nor penetrate a supporting stratum, the resistance which it offers to superimposed loads is due to the frictional resistance between the surface of the pile and the surrounding soil. In any endeavor to ascertain the amount of this frictional resistance through other than experimental methods which involve the piles themselves and which are very difficult of execution, the general conditions involved in the problem of earth pressures must be studied.

The cohesion which characterizes solid bodies from the point of view of the physicist exists in soils under ordinary conditions only to a limited extent. Few investigators have given this subject any study, but the best discussion in English is contained in Prelini's book on Earth Slopes, Retaining Walls and Dams. While a rigorous discussion must include the effect of cohesion, it has been the usual practice to ignore this element in the problem, both because of the mathematical difficulties introduced by its inclusion in formulas and because of its widely varying nature due to changes in the degree of saturation and in the compression produced by driving adjacent piles or by similar causes. Rankine's celebrated discussions consider earth only as a granular mass, and his deductions are open to criticism since the results obtained differ from those of actual experiment, the difference being due to his omission of cohesion and because most engineers employ in his formulas the angles of surface slope, which the writer's experiments[3] have shown are quite different from those of the internal friction of the material. The latter should obviously be used for all earth pressure computations and give results by using Rankin's formulas, which are very closely in accord with the results of properly conducted experiments. When the angle of internal friction is employed, the effect of cohesion seems to be automatically included, so that complicated mathematical conditions are not necessary.

Under relatively heavy pressures and a varying degree of saturation depending upon the material, almost every variety of soil discloses phenomena, which can be most easily explained on the assumption of the existence of a sort of viscosity, such as is observed even in solids of high cohesive strength.[4]

Tests of the compressibility of earths show a certain amount of elastic deformation, of course always in combination with a large amount of permanent set, the elastic reaction being very small in dry sand and relatively very large in garden soil. In a purely granular mass devoid of cohesion and disclosing no elastic reaction, a pile could be driven only by an absolute displacement of material, and the resulting pressures against the displacing body would be purely those due to the weight of the material above any given area of the displacing body. Where the material, however, is compressible and exhibits any elastic properties it is possible that the pressures exerted against the displacing mass may be greater than under the conditions above mentioned. Finally any material which is of a viscous nature will tend to shift, so that the pressures which might have been produced against the surface of such a displacing body as a pile would be entirely altered with lapse of time, in some cases increasing and in others decreasing. For example, a pile of slightly irregular surface would displace the material, so that voids would be left adjoining the hollows in the surface of the solid into which the viscous material would ultimately flow and exert a greatly increased resistance to subsequent motion. This is the usual phenomenon observed under most conditions with regard to piles. On the other hand, where considerable elasticity exists in a soil, in combination with a large compressibility, the lateral pressures immediately after the displacement of the material by the solid are actually greater than exist at later periods after the surrounding material has had an opportunity to flow slightly away from the penetrating body, so as to readjust and equalize the stresses throughout the whole mass. Occasionally phenomena which are traceable to this condition have been encountered in connection with pile driving observations in which a pile showed a large resistance to driving and subsequently settled through the surrounding soil. This phenomenon is not to be confused with that often observed in which settlement takes place, due to the compression of deeply underlying strata, into which the pile and its surrounding earth settle en masse.

Similar changes of the lateral friction and attending lateral pressure may also be due to vibration, which may produce effects similar to those observed when a pile of irregular shape is driven and voids are produced, thus reducing the actual area of contact. Vibration may also expedite the viscous action, the readjustment in pressures taking place more rapidly and to a greater extent, causing the resulting frictional resistance to fall below the necessary requirements. Changes in the humidity of the soil are also apt to produce changes in the lateral pressures. This is sometimes caused by actual changes in the coefficient of sliding friction between the solid mass and the soil. Again it may be due to the fact that the lateral pressure will vary with the coefficient of internal friction, as indicated by the writer's experiments. In the last paragraph it was explained how a reduction in pressure may be produced through viscous action. An actual increase in pressure may also be developed through a readjustment of stresses caused by the displacement of soil by driving other piles in the vicinity.

While considering increases of pressure, the well known arch action must not be overlooked, especially with non-viscous materials. This arch action serves to prevent the full theoretical lateral stresses, which will only be produced where a marked viscosity exists. Arch action also influences the upward pressure against the bottom of a pile and is indirectly the cause of carrying down of a group of piles by a single overloaded one.

Every one familiar with the phenomena of pile driving is aware of the considerable changes which take place, especially in the interval immediately after the driving of the pile. The writer has observed increases of resistance amounting to over 1,000 per cent within twenty-four hours. His investigations have discovered practically no data in regard to this phenomenon, which is universal in effect and which absolutely governs the ultimate supporting power of a pile, but is ignored in every pile formula with which he is acquainted. It seems to be possible to collect data from a comprehensive series of experiments with different kinds of soils, and at very little cost, by simply measuring the resistance offered by several piles, in terms of any pile formula, where the soil conditions had been previously ascertained. Comparisons between individual cases will be much more difficult to reduce to any proper basis upon which to draw conclusions with regard to different soils than is the case with regard to the time rate of change of pressure for any special pile in a known soil, which can be even more easily determined and is of equally great value. It is strongly recommended that such data be collected.

Piles as Combined Columns and Floats.—In making computations of pile resistance, the course is often pursued of computing independently the supporting power of the soil at the point of the pile and the frictional resistance offered by the sides. This is done on the assumption that the two elements which correspond to the coefficients of elasticity are equal. It is needless to say that this is rarely the case. Other investigators treat the problem as if the bottom of the pile were provided with a long tapering point, so that the whole phenomenon is one of frictional resistance, which later may vary from point to point along the pile surface due to variation in the strata penetrated. That a compressed earth point actually exists under the bottom of a blunt pile has been practically demonstrated to the writer's satisfaction by his observations not only in the case of the model with a glass side,[5] but also in the case of full sized models driven in boxes of earth, and from excavation made under the points of actual piles. Theoretically each change in the slope of the pile surface, as well as each change in the character of the surrounding soil, produces a variation in the unit resistance. That the theoretical conditions approximate very closely to those actually existing in nature has been demonstrated in several instances, notably in the experiments of Stern, described in "Das Problem der Pfahbelastung."

The Forces Acting on Piles.—Under any conditions in which piles act as columns, both the unit compressive strength of the material and its bending strength are involved. Every pile driving specification should give the maximum unit compressive stress to be allowed and the load whch may be carried, whenever the pile acts as a column. For this information it is necessary only to turn to the experiments made by engineering laboratories. It is a difficult matter to arrange any pile driving formula to take account of these items, but manifestly an ideal formula should do so. The only trouble with laboratory experiments is in their wide difference from practical conditions. In the laboratory an effort is usually made to simplify conditions to the utmost, so as to be able to change but a single condition at a time and thus measure its effect upon the general problem. In the field innumerable extraneous conditions enter to complicate matters, so that laboratory data are to be employed with this point constantly in mind. However, with a properly equipped laboratory it would be possible to make actual tests with a large number of stock piles, one end of the piles to be bedded in earth to varying depths, so as to afford varying degrees of restraint or the tests might be made with square ends and the restraint provided by means of steel springs or other equivalent devices. A very large number of such experiments would be

[5]The Supporting Power of Piles, by E. P. Goodrich, Trans. Am. Soc. C. E., Vol. 48, p. 180, Aug., 1902.

necessary to ascertain true averages under different conditions or what is even more important the extreme range of strength secured and the average variation from the mean. It is only from a number of results that the measure of their accuracy can be determined either theoretically or practically. On the basis of such laboratory tests only a very few comparative field tests would be needed to determine actual conditions and hence what sort of a formula is required and its method of application.

A close approach can doubtless be made to the laboratory work above described by means of indirect experimental evidence and its application in purely theoretical mathematical formulas. For example, the writer always makes use of his experiments concerning the compressibility and elasticity of various soils with various degrees of saturation to determine in any special case whether the earth pressure initially developed will increase or decrease with the lapse of time. The actual lateral pressures to be expected are computed by the writer on the basis of his experiments with the shallow cylinder described in "Lateral Earth Pressures and Related Phenomena." These results are checked as far as possible in individual cases by making the described experiments to determine the internal friction of the earth. With this data available, results can be predicted with a fair degree of precision except for the influence of the factor of viscosity. The writer knows of no experiments on viscosity except his own, which were performed only on clay and hence are too meager to obtain accurate results. This field is one in which the testing laboratory can be of material service to the engineer who has to do with the effects of lateral pressure in the design of pile foundations, masonry footings, retaining walls, earth embankments, etc.

A more elaborate experiment, which is sometimes performed and which gives results combining the effects of compressibility and viscosity, is the one described above for ascertaining the carrying capacity of the earth at varying depths. Information of this character is of considerable value because it often happens that the driving of a cluster of piles simply serves to consolidate the soil throughout a given region. The latter, in its turn, rests on underlying and supporting strata, which may actually be incapable of resisting the stresses developed, and hence settlement of the whole mass may occur. The result is often attributed to improper piling or pile driving, whereas the true causes are entirely different. This difficulty is often encountered where the piles are too short. On the other hand in the effort to overcome this particular source of trouble, needlessly long piles are employed. The aim should be to discover the proper length of pile to consolidate the soil to a depth at which the resistance is sufficient to support the superimposed loads, and where the character of the material is such that no viscous action will take place in any of the underlying strata.

Indirect Methods of Test.—The usual procedure, which was followed by those who desired to secure some measure of the forces which resisted the load upon a pile, has been by a theoretical consideration of the phenomena observed during the sinking or driving of the pile, especially of its action under the blows of a hammer. At best, however, such information will afford data which is applicable only at the time of driving, since it ignores entirely the subsequent changes in the condition of the earth, which have been shown to modify materially the supporting power of the pile. In the mathematical development of the subject, the general theory of impact is employed. With regard to the theoretical phenomena which would be expected during the impact of perfectly elastic materials, with perfect freedom of motion, there is no question; and even when the masses are not perfectly elastic with known coefficients of restitution the matter still remains comparatively simple. In the case of a hammer falling upon the head of a pile and of the pile moving under the effect of this blow, perfect freedom of motion is impossible. The hammer, if of the gravity type, is restrained from falling freely by the friction of the guides, that of the rope through the sheaves by the stiffness of the rope, by the friction of the drum of the hoisting engine, etc. It may be possible in any given case to determine the influence of each of these factors, and thus to ascertain the exact velocity and hence the corresponding momentum with which the hammer strikes the head of the pile. By assigning proper coefficients applicable to the size, shape and material of the hammer and of the pile, it is possible to determine the velocity of the latter at each instant during the impact, provided, however, that the actual masses moved by the hammer are known. Besides the pile itself, these masses must include an absolutely unknowable mass of soil. Granting, however, the possibility of assuming a proper value for the mass acted upon by the hammer and the further possibility of computing accurately its initial velocity, the problem again immediately enters the region of the unknown, because the real item concerning which knowledge is desired is the measure of the force which brings the pile to rest. If this force is assumed constant and the initial velocity and mass of the pile are known, as well as the distance which it travels, before it is brought to rest, then the measure of the force can be computed. There is every reason to believe, however, that this force is not a constant during the motion of the pile, and that it should vary in character and strength at different depths, with different degrees of compactness of soil, with the shape of pile and the velocity of its motion, is to be expected from the general theory of earth pressures. It was in an endeavor to solve some of the problems arising with regard to the kind of force acting that the writer devised his graphical method of indicating the action of a pile during the blow of the hammer.[6] In connection with this work amount of variation encountered in the several phenomena investigated and the limits of accuracy for the several devices employed.

As a result of his investigations, the writer is of the opinion that, as far as the phenomena connected with the driving of a pile are concerned, a very simple formula may be employed in connection with a coefficient, which may be determined for a special set of conditions with a fair degree of accuracy, but which must vary widely, in order to cover the great variety of conditions actually met in practice. This simple formula might be employed as the basis around which to arrange a number of dependent functions or coefficients, which should take account of the soil conditions, the length of pile acting as a column, etc. For a number of years the writer has been working intermittently toward the construction of such a formula, but so much experimental data yet remains to be obtained that no definite form has yet been decided upon. With the co-operation of your society, it might be possible to secure the necessary information which would then go far to settle a point which has been in controversy among engineers for a century or more, viz.: the actual supporting power of a pile under known conditions.

Factors Theoretically Essential to a Complete Pile Formula.—The following items should be known and included in a theoretically complete pile formula to be used for piles supported only by friction, the formula being based on data obtainable from the effect of the hammer on the pile and the subsequent action of the earth around the pile: (1) Weight of pile. (2) Weight of hammer. (3) Fall of hammer. (4) Coefficient of friction during fall. (5) Penetration of pile. (6) Spacing of piles. (7) Coefficient and factor for the compressibility of the soil and the effect of spacing. (8) Coefficient for the effect of the shape of the pile on the compression of the earth, etc. (9) Length of pile below ground surface. (10) Coefficients and factors to allow for subsequent changes in lateral pressure throughout the length of the pile. (11) Length of pile above ground. (12) Area of pile. (13) Coefficient and factors to govern column action and unit compressive stress on pile .

[6]The Supporting Power of Piles, by E. P. Goodrich, Trans. Am. Soc. C. E., Vol. 48, p. 180, Aug., 1902.

Tests Required.—The following items should receive attention and special tests be made with regard to them: (1) Lateral restraint afforded by soils of different kinds and degrees of saturation. (2) Lateral pressures exerted by different soils, etc. (3) Compressibility of different soils. (4) Elastic reaction produced by different soils. (5) Viscosity exhibited by different soils. (6) Effects of jar on each of these characteristics. (7) Effect of lapse of time on these characteristics.

LETTERS TO THE EDITOR.

Paving Bonds and Guarantees.

Sirs: At the recent meeting at Chicago of the "Convention for Standardizing Paving Specifications," the "Committee on Bonds, Guarantees and Uniform Bidding Blanks" made some excellent recommendations, but the writer feels that in some important particulars the tentative report, which was necessarily hastily drawn, suggests plans which are not to the best interests of municipalities.

The report suggests a rather arbitrary classification of the several different forms of pavements into different periods of guaranty. The report in this respect provided that "asphalt, bitulithic or bituminous macadam and wood block or other pavement, requiring special equipment to lay and maintain, and also such pavements as are of a patent or proprietary nature, new or more or less experimental in character, shall be required to be maintained for a period of five (5) years from the first day of July next following completion," while "Pavements composed of materials more durable in character, among which we would include stone blocks, vitrified brick and well established Portland cement concrete pavement, shall be required to be maintained for a period of one (1) year from the first day of July next following the completion."

The reference to "well established Portland cement concrete pavement" is ambiguous and contradictory. Under this classification provision is made for guaranty period of one year, while, the writer believes, all forms of Portland cement concrete street pavements, wearing surfaces, are presented as "of a patent or proprietary nature," under which the report suggests a guaranty term of five years. Surely this class of pavements has not been in sufficiently general or uniformly successful use for a sufficiently long term to put them on a more favorable basis than creosoted blocks, asphalt or bitulithic. In fact the modern Portland cement concrete pavement construction has been in vogue scarcely more than two years, and reports of pavements of this class laid within this period show that many of them, at least, have required heavy repairs in that short period.

On the other hand creosoted wood block pavements are pointed to, for instance, on Tremont street, Boston, which have been in successful use without repairs for nine years. There are hundreds of miles of asphalt pavement more than five years old, which are in perfect condition. Official reports from the cities of Pawtucket, R. I., and Cambridge, Mass., show that the bitulithic pavements which were first laid in those cities nine years ago have never needed nor required repairs and are still in perfect condition.

Doubtless pavements of all these classes laid more recently have required repairs, from one cause or another, and to a greater or less extent, but this may be said of any and every other form of engineering construction, pavement or otherwise.

The many cities which have found brick pavement to require extensive repairs in two or three years bear witness that, although pavements of this kind can be shown in good condition after ten years or more use, it is not a kind of pavement which should be treated more favorably, as to guaranty period, than other forms of pavement, with the exception of first-class granite or Medina sandstone blocks laid on concrete foundation.

There is a general and rapidly growing sentiment among municipal officials in favor of shortening ior eliminating the term of guaranty on all classes of pavement, which have been in use a sufficient term and have proven sufficiently successful to warrant classifying them as "standard."

As municipal engineers are becoming more and more efficient in the art of street paving, taken in connection with the fact that the services of consulting engineers, chemists and experts in the several paving fields are procurable on reasonable terms, it is a very serious question, if the time has not arrived when the guarantee on all standard pavements should not be reduced to one year, if not entirely eliminated and a fraction of the money now being expended for guarantees, surety company bonds, reserves and insurance be expended in improved construction and more rigid, intelligent and scientific inspection and the balance remain in the pockets of the taxpayers.

We believe that in the aggregate but a small per cent of the increased price paid the contractors, which they must exact on account of the guarantee, is expended in repairs to the pavements guaranteed. If this is correct, then the guaranty is not to the interest of the taxpayer.

Finally, whatever the guaranty period, the writer fails to see any justification for the arbitrary suggestion that it begin "the first day of July next following completion." If a contract is completed on July 2, why should a guaranty be arbitrarily required for a year longer than if completed two days before? Why not have the guaranty period begin in all cases with the completion of the work? This brings up a question, which should be, but seldom is, fairly and clearly stated in specifications, to-wit: "What is the date of completion and consequent beginning of the guaranty period, if any?" This is often fixed at the "date of final acceptance," and under this we have known of cases where the contract period has been extended for months because the city engineer or City Council were dilatory in "officially accepting" the work, although during all this period it has been in use by the public. In other cases we have known of the greater portion of the pavement having been laid, but a small portion deferred for a year or even two years because some underground work, out of the control of the paving contractors, has not been completed, and consequently "final acceptance" deferred. This is an unwarranted and unfair hardship on the contractor. The writer suggests the following for the careful consideration of municipal officials:

The date of completion shall be considered to mean the date that the completed pavement on the entire contract is opened to traffic and public use; and in cases where construction of a portion of the work is, for any cause, deferred later than the 31st of December of any year, the guaranty period on that portion, completed and opened to traffic and public use prior to December 31st, shall begin with the date the whole of the portion of the work constructed prior to December 31st was opened to public use, and on the portion on which the construction was deferred until the following year, the guaranty period shall date from the date such deferred construction is opened to such public use.

The committee's report suggests that in lieu of surety company bonds covering the guaranty period that 10 per cent of the contract price per square yard for pavement laid be retained by the city in cash covering the guaranty period. There are several serious objections to this.

First: Generally speaking, it must be admitted that paving contracts are being let at a very low margin of profit, so that such an onerous provision as the retaining of 10 per cent of the contract price for a term of five years would surely result either in the advance of contract prices in an amount nearly, if not entirely, equal to the cash retained, or in limiting competition to the very few paving contractors who are sufficiently strong to get financial credit to enable them to carry the obligation.

Second: Such a provision seriously raises the question of legality of assessments generally issued in payment of the work, the general conclusions of the courts having been that when the cost of maintenance is to be paid by the city at large, which is the general law on the subject, the charging of any part of the cost of maintenance into the special assessment levied to cover the cost of the construction renders the assessment void and uncollectable. Surely maintenance requirements which are so onerous in their provisions as to increase the contractor's price necessitate a direct charge in the assessment on account of maintenance which the law provides is to be paid for by the city at large and not assessed on the abutters. It hardly seems possible for any one seriously to claim that any contractor will be willing to take contracts with 10 per cent of his money held by the city for five years at as low a price as if he were able to use that capital in his business.

If a contractor lays an aggregate of 500,000 sq. yds. of pavement per year at an average price of $2.25 per sq. yd., the retaining of 10 per cent of the contract price would amount to $110,000 per annum, and in five years the aggregate cash retained by cities from his contracts would be $550,000. Ordinarily when cash has been retained by cities in the past they have allowed the contractor from 3 to 4 per cent interest, or approximately half the interest the contractor has to pay for the use of money, on which basis the loss of interest alone to the contractor, after he has been doing business on the above basis for five years, would be approximately $20,000 per annum. We believe there is no contractor who is to-day making a margin of net profit, after paying discount on municipal securities, interest on borrowed money, and other necessary general expenses, which would make it possible for him to stand this tax and loss in interest without a material increase in contract prices.

In the past a few cities, including New York, have retained a percentage of the contract price as security for pavement guaranty. We believe that such cities have almost, if not universally, paid much more for their pavement than other cities which accept a surety company's bond or exact no guaranty, have paid for the same kinds of pavement.

The writer believes if cities are unable to get satisfactory results under surety company's bond for the guaranty period, without making the bond so onerous as to itself increase the cost to the contractor, and consequently necessitating higher pavement prices, that they can most economically overcome the difficulty by engaging the very best expert service obtainable and giving close inspection of construction and provide no guarantee or a guarantee for a period of one year, which is sufficient time for imperfections in construction to develop.

It is a serious question if maintenance guaranties are not against public interest, even under the present generally adopted provision of surety company bond covering the guaranty period. Surely, the premiums on those bonds and the reserves which the prudent contractor must make to cover the contingent liability cost the contractor a very considerable amount which he must, and doubtless does, include in his contract price.

The committee's report develops that City Engineer Fendall of Baltimore has recommended the elimination of maintenance guaranties. This has already been adopted by a number of cities and officials of many others are seriously considering it. We have noticed that in cases where maintenance guaranties have been eliminated the contract prices have materially dropped. About two years ago the Supreme Court of the state of Alabama decided that any form of maintenance guaranty is illegal, following which Alabama cities adopted specifications eliminating the guarantee, the result being a material universal reduction in price for all classes of pavement..

If a system of no guaranty is adopted the city can protect itself in the case of proprietary or patented pavements by requiring the contractor to furnish the materials or wearing surface necessary for repairs at a certain price per square yard of repairs required including cuts made to reach underground service pipes for such term as the city may elect.

Very truly,
"PAVING CONTRACTOR."

Chicago, Ill., April 12, 1910.

The Minneapolis, St. Paul & Sault Ste Marie Ry. has had surveyors at work between Medford, Walsh County, North Dakota, and Drake, McHenry County, North Dakota, on a line which would bring about the direct shipment of grain from the central west portions of North Dakota to Duluth. As proposed this line will be about 160 miles in length and will pass through Devil's Lake. It goes through portions of Walsh, Nelson, Ramsey, Benson, Pierce and McHenry Counties.

Personals.

Mr. H. R. Safford has resigned his position as Chief Engineer of Maintenance of Way of the Illinois Central R. R. to go into the railway supply business.

Mr. James A. Brown has resigned his position as a Constructing Engineer in the Ordnance Department, U. S. Army, and will henceforth devote his time to general plant engineering, making a specialty of sloop equipment work.

Mr. Robert J. Potts, Assistant Professor of Civil Engineering at the Agricultural & Mechanical College of Texas, has been appointed Professor of Highway Engineering, a newly established branch of the Department of Civil Engineering at that college.

Mr. C. S. Davidson, a specialist in hydraulic and concrete work, has become associate with Mr. E. C. Crum, Civil Engineer and Constructor, Frederick, Md. They will continue to do all classes of municipal and railway engineering and constructing work under the firm name of Crum & Davidson, at the present offices of Mr. Crum in Frederick, Md.

Mr. A. W. Thompson, heretofore Chief Engineer of Maintenance of Way, Baltimore & Ohio R. R., has been promoted to Chief Engineer, inclusive of the Baltimore & Ohio Southwestern, succeeding Mr. A. M. Kinsman, who is relieved at his own request and appointed Consulting Engineer. Mr. Earl Stimson, heretofore Chief Engineer of Maintenance of Way at Cincinnati, O., succeeds Mr. Thompson.

Mr. Horace S. Baker, 1727 Chase Ave., Chicago, Ill., has been appointed Engineer of the Track Elevation Department of Chicago, to succeed Morris K. Trumbull, who resigned March 31, after holding the position ever since it was created three years ago. Mr. Trumbull returns to the Chicago & Western Indiana R. R., where he was formerly assistant to H. S. Lee, Chief Engineer. Mr. Baker until placed in the new position, was chief designer for Chicago city water works bureau. He has also been in the track elevation departments of the Western Indiana and of the Chicago & Northwestern Ry. He is a graduate of the Massachusetts Institute of Technology.

Catalogs Worth Having.

Engineers and contractors should have on file the latest catalogs of machines, tools and supplies that they use. In sending for catalogs reviewed or advertised in this paper, you will confer a favor on us if you will write directly to the advertisers and state that you saw the catalog mentioned in ENGINEERING-CONTRACTING. If you are in the market for tools, machinery or supplies, tell us and we will notify promptly the leading manufacturers.

American Concrete Systems.—Paper folder, 3½ x6¼ ins., 6 pp. American Concrete Co., 80 William St., New York, N. Y.

A folder telling of the adaptability of the various monolithic, steel, reinforced concrete products and systems owned and used by this company.

Hydraulic Mining Cartridge. — Paper, 6x6½ ins., 16 pp. The Hydraulic Mining Cartridge Co., 42 Broadway, New York, N. Y.

Gives a good description of a new substitute for explosives in coal mining.

Eclipse Concrete Mixer.—Paper, 6x9 ins., 16 pp. The Standard Scale & Supply Co., 23 N. Canal St., Chicago.

This booklet is gotten out by the company named to show their 1910 models with the latest improvements. The catalog is well illustrated and contains, besides the mixer, illustrations and descriptions of various types of steam and gasoline engines.

Pumps.—Paper, 3½x6 ins., 4 pp. The Barnes Mfg. Co., Mansfield, O.

This is a circular recently issued by the company. It shows their line of diaphram pumps, which consist of three sizes, namely, 2½-in., 3-in. and 4-in.

Cement.—Paper, 3½x6½ ins., 36 pp. The Superior Portland Cement Co., 1503-1513 Union Trust Bldg., Cincinnati, O.

A booklet which contains a good detailed description of the manufacture of Portland cement by this company.

Cement.—Paper, 3½x6¼ ins., 8 pp. Lehigh Portland Cement Co.

"The Future's Past" is the title of the booklet sent in by this company, and is a short argument, purposing to have been published in the indefinite future, regarding present day use of concrete.

Power From Coal.—Paper, 3½x6¼ ins., 12 pp. Electrical Testing Laboratories, 80th St. and East End Ave., New York City.

A booklet describing the measure of the value of coal to the manufacturer of power.

Hydrolithic Waterproofing.—Paper, 6x8¼ ins., 32 pp. The Waterproofing Co., 150 E. 36th St., New York.

A very good description of the application and advantages of hydrolithic cement, with illustrations, specifications and data interesting to engineers, contractors and architects.

Contract News Section

of

ENGINEERING-CONTRACTING

A Consolidation of ENGINEERING-CONTRACTING—CONTRACT NEWS—ENGINEERING WORLD—THE DIRT MOVER.

Containing Items of Interest to Railroad, Public Works and Other Contractors.

The Doings of the Week.

The principal railway construction contract of the week and the largest that has been let in the East for some time, has been secured by the Carter Construction Co., 184 La Salle Street, Chicago, Ill. This contract calls for the construction of the extension of the Western Maryland R. R. from Cumberland, Md., to Connellsville, Pa., a distance of 83 miles. Other railroad contracts of the week include the following: D. B. Lacy, Anniston, Ala., for 100,000 cu. yds. of grading for the Louisville & Nashville R. R. yards at Paris, Ky.; Kilpatrick Bros., Beatrice, Neb., for constructing a branch of the Union Pacific from Wamsutter, Wyo., to Craig, Colo.; Porter Bros., Spokane, Wash., for constructing a 3,400-ft. tunnel for the United Rys. of Portland, Ore.; W. J. Oliver, Knoxville, Tenn., for constructing the electric railway from Greenville to Spartanburg, S. C., for the Greenville & Spartanburg Electric Ry. Co., the contract amounting to about $750,000; and Kahmann & McMurry, 709 Sharp Bldg., Kansas City, Mo., for the grading work on the Menard end of the Frisco.—It looks now as though there was to be considerable new railroad construction work in New England in the near future. The Rhode Island Legislature has granted a charter to the Southern New England Ry., a subsidiary company of the Grand Trunk System, by which the latter will secure an entrance to Providence, R. I. As a result possibly of this, announcement has been made that the New York, New Haven & Hartford R. R. will at once proceed with plans to double-track the Air Line from New Haven to Boston and to construct the through route from New York to Sherbrooke, Que. In the meantime the Boston & Maine R. R. has had engineers in the field to look over a route for a branch line from Brattleboro, Vt., to Hinsdale, N. H., connecting two divisions of the road, and also to look over a route for a line from Windsor, Vt., to West Lebanon, N. H.—A fair sized dredging contract has just been let by the Water Commissioners of St. Paul, Minn. The contract calls for dredging about 1,500,000 cu. yds. mostly vegetation and peat from Vadnais Lake, and was awarded to the La Crosse Dredging Co., of Minneapolis, Minn.—The construction of 1,500-mile railway in Turkey is proposed by Americans who have recently been granted a concession by the Turkish Government. Manning, Maxwell & Moore, 85 Liberty St., New York City, are said to have the contract.—Senator Burton, Chairman of the National Waterways Commission, on Apr. 14 presented a minority report on the pending Senate bill which would appropriate about $52,000,000 for the improvement of rivers and harbors. His opposition to the bill related rather to the system than to the amount involved. He did not consider the sum large, but he felt that under present methods many injudicious and wasteful projects were sure to be included with many that are meritorious.—An association comprising 12 companies holding 22 contracts for over $55,000,000 worth of work on the New York State Barge Canal has been formed. The primary objects of the association are to take action on such legislation affecting barge canal construction work as shall in the opinion of the contractors, appear unwise; to properly discuss and consider work of such magnitude as the construction of this canal affords and to enable the heads of the various companies to visit the work being done by other companies and gain ideas as to management and methods.

New Water Power Bill.

One of the pet projects of the preceding and present government administrations has been legislation regarding water power sites. A bill regarding this, which seems to give the government powers wide enough to satisfy the most carping critic of the vested interests, has just been given favorable action by the House Committee on Interstate Commerce. As now framed the measure would give the federal government full control over the plans as well as the construction, maintenance of all such works and revocation of such contracts. It would make the approval of the War department a condition precedent to the building of all dams authorized to be constructed across a navigable stream. The bill would impose stringent restrictions upon dam privileges, including discretionary authority of the War department to require dam owners to maintain locks or similar structures. The owners would have to convey to the United States free of cost title for necessary land for the construction of locks and approaches and free use of water power.

Vote Dry and Get Water Works.

Virtue may be its own reward, but nevertheless a little town down in Ohio has also been rewarded with waterworks, a sewer system and electric lights as a result of its virtue. It seems that a wealthy resident of the town a year or so ago offered to install waterworks, sewerage and electric lights without cost to the town provided the citizens would vote out the saloons. This they did, and at the recent election the town again went dry by a vote of 162 to 97. The terms of the gift provide that the town shall continue dry for the next 50 years or the improvements will become the property of the heirs of the donor. According to press reports the offer also provides that all the houses in the town shall be painted white and shall have red tile roofs. It is further provided that all fences shall be replaced by hedges and that all trees shall be planted equal distances apart. Prohibitionists claim that the only reason the benighted 97 voted for saloons was due to the fact that they didn't want to paint their houses.

A New Central American Railroad.

A new railroad for Central America is proposed, and the interesting point about it is that it is to be built by the United States government. The road will be 274.4 miles long and will connect the city of Panama with David, a city on the Pacific coast in the province of Chiriquaz, Panama. Already the secretary of war has authorized the Panama R. R. Co., which is controlled by the U. S. government, to enter into a contract with the government of Panama for preliminary and location surveys. These will be made by the engineering force of the Panama R. R. In general the routes recommended by the Intercontinental Railroad Commission in 1893 will be followed. The surveys are to be completed in time so that when the next national assembly meets at Panama the United States will be ready to submit a proposition for the construction of this line as an extension of the present government owned Panama R. R. English, French and German capitalists stand ready to build this road, and the primary reason assigned for the taking up of the venture by the United States is that it will prevent the entrance of undue foreign influence into Panama, which would make necessary additional fortifications for the canal.

Railroad Construction in Oklahoma.

When Oklahoma became a state it adopted a constitution which contained a number of restrictions regarding the construction of new railroads in the state. As a result the active period of railroad building which had prevailed ceased, owing to the fact that outside capital could not be induced to invest because when the railroads were built they could not be sold. The Oklahoma Federated Commercial Clubs is making a determined effort to remedy these conditions and has taken steps toward having an election called to vote on amending the constitution to remove the restrictions regarding railroad building. It is stated that if the amendment carries 3,000 miles of railroad now projected will be constructed, and that within two years the state will benefit by the introduction of $75,000,000 of taxable railroad property. In the meantime the Farmers' Educational and Co-operative Union and the State Federation of Labor of Oklahoma are claiming that the railroads now operating in the state are out of reach of the people or the powers of the court of the state and will submit a petition to the voters proposing that a vote be taken at the November election to amend the constitution so as to provide a new commission of six members with power to construct and operate railroads in the name of the state.

Location surveys are now underway near the Cumberland River at Gainesboro, Tenn., for the projected line of the Tennessee, Alabama & Kentucky R. R., and it is said that construction work will be first started on that portion of the line. The road will be about 230 miles in length, 100 miles shorter than the shortest line from Louisville to Chattanooga. It will pass through Dunlap, Spencer, Sparta, Cookeville, Gainesboro, Tompkinsville, Edmonton and Hodgenville.

The Electric Light Co. of Pittsfield, Mass., has just made arrangements with the Stone & Webster Engineering Corporation of Boston, for an addition to the plant at Silver Lake in Pittsfield.

The Otis Co. of Ware, Mass., is preparing to blow up its old dam in the Chicopee River just above Three Rivers, Mass. This will be replaced with a new dam, located farther up stream, to avoid interference by the head water of the Ludlow associate dam.

Confirmed Reports by Engineers and Contractors

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS.

Railroads—Steam and Electric.

ARKANSAS.

The Prescott, Reader & Fordyce R. R., which now has nine miles of standard gage line in operation, has had surveys made for 75 miles of additional line. The capital for construction has not been secured as yet, and the time for letting construction contracts is indefinite. W. B. Ferguson, Little Rock, Ark., is President.

GEORGIA.

The location work for the projected extension of the Rome & Northern R. R., from Gore to Tunnel Hill, Ga., has not been completed as yet. Construction contracts will probably be let in the next 30 days. The extension will be about 32 miles long. H. M. Smith, Rome, Ga., is Chief Engineer.

INDIANA.

The Alan Construction Co., Indianapolis, Ind., has the contract for constructing the road bed of the Beech Grove Traction Co., from the Maine County line, City of Indianapolis, to Beech Grove. The contract includes 10,000 cu. yds. of earth excavation and a small I-beam bridge 28 ft. long.

The Capital Circuit Traction Co. has made surveys for its projected line. The projected length is 170 miles and the route is through Greenfield, Noblesville, Lebanon, Danville, Martinsville, Franklin and Shelbyville, Ind., forming a circle. The capital for construction has not been secured as yet. John A. Shafer, 3725 North Illinois St., Indianapolis, Ind., is Chief Engineer, and J. N. Crabb, 926 Law Bldg., Indianapolis, Ind., is President.

KANSAS.

The Kansas Union Traction Co. has completed surveys for its projected 40-mile line from Parsons, Kan., to Coffeyville, Kan., passing through Altamont and Edna. The capital for construction has not been secured as yet and no date for awarding construction contracts has been determined on. Archer, Rollins & Co., Kansas City, Mo., are the engineers. Wm. A. Jones, Altamont, Kan., is President and Barney McDaniel, Altamont, is Secretary.

KENTUCKY.

Jas. Ward, Carbondale, Ill., has taken a subcontract from the Walsh Construction Co., Davenport, Ia., for work on the Louisville & Nashville R. R. near Madisonville, Ky. The work includes 100,000 cu. yds. earth excavation, and 40,000 cu. yds. rock excavation.

MARYLAND.

The Carter Construction Co., 184 LaSalle St., Chicago, Ill., has been awarded the contract for the construction of the extension of the Western Maryland R. R., from Cumberland, Md., to Connellsville, Pa., a distance of 83 miles.

OHIO.

J. C. Carland & Co., Toledo, O., as previously noted, have been awarded contracts by the Big Four Ry. for work at Miami and Middletown and for work at Cleveland for the Lake Shore Ry. for the Cleveland Belt Line. The work at Middletown for the Big Four Ry. includes 800,000 cu. yds. of earth excavation and the work at Cleveland requires a like amount. In addition the Cleveland work includes 20,000 cu. yds. of concrete masonry. Sub-contracts have been let to Carland & Monarty, Cleveland, A. S. Hecker, Cleveland, and George Maxfield, Middletown, O.

TEXAS.

The Texas Building Co., F. & M. Bank Bldg., Fort Worth, Tex., which has the contract for grading for the Brownwood North & South R. R., has 300,000 to 400,000 cu. yds. both way work between Brownwood and May, Texas to let; 75 per cent of this work is in the fields and can be handled with fresnos.

Harty & Ford, 307 Ecanlon Bldg., Houston, Tex., as previously mentioned in this paper, have the contract for constructing the Galveston & Houston Electric Ry. from Clear Creek to Brays Bayou, a distance of 18.6 miles. The contract includes 200,000 cu. yds. of earth excavation and a like amount of embankment. The contract is for the north section of this road and includes grading, fencing, clearing, grubbing and drain boxes, to be completed by Sept. 1st, 1910. The lower section (16.1 miles) of this road is contracted to J. C. Kelso of Galveston. The yardage for this section is about the same as on the Harty & Ford contract.

WISCONSIN.

The Prairie Farm & Southwestern Railway Co., which is projecting a railway from Prairie Farm, Wis., has adopted the name of "Badger Short Line," as the short name for the company. J. H. Thomas, formerly Chief Engineer of the Twin City & Lake Superior Ry. Co., has been put in charge of the engineering and has recently, with his corps, completed the survey. In a short time application will be made to the State Railway Commission for a permit, and soon after, actual construction will commence. The work possibly may be let out to contractors. J. De Wilde, Prairie Farm, Wis., is Secretary and Treasurer.

CANADA.

J. S. Hargrave Co., Ltd., Winnipeg, Man., as previously announced in this paper, has the contract for double tracking on the Canadian Pacific Ry. from Winnipeg, Man., to Portage La Prairie, Man. The contract includes 500,000 cu. yds. earth excavation, 300 cu. yds. of concrete masonry and 10,000 lin. ft. of piling.

The limit of time for submitting bids for the clearing, grading and bridge work on the extension of 31 miles (more or less) of the Algoma Central & Hudson Bay Ry., between Hawk, Lake Junction, A. C. & H. B. Ry., and Hobon, C. P. R., has been extended to noon, April 30th. Profile, specifications and form of tender may be seen at office of N. Coburn, Chief Engineer, A. C. & H. B. Ry., Sault Ste. Marie, Ont., to whom all tenders should be addressed.

Power Developments, Levees, Drainage and Irragition Works.

COLORADO.

The Lucania Tunnel & Mines Co., John McColl, Superintendent, Idaho Springs, Colo., will let a contract Apr. 20, for driving a rock tunnel 500 ft. long 8 ft. 8 in. in clear, 2½ miles north of Idaho Springs.

We are advised that the Boyd Lake Reservoir & Irrigation Co. has not as yet decided on full plans for its proposed work. The reservoir was built by B. D. Sanborn of Greeley, and turned over to the company nearly complete, and cement riprapping of the banks is all the work that will be undertaken at present. This work is estimated at $10,000 and will be done by the company's own force locally and bids will not be advertised for. The reservoir is a natural one, nearly four miles long, one mile wide and 60 ft. deep and does not require much artificial work. B. D. Sanborn, Greeley, is interested.

MASSACHUSETTS.

Coleman Bros., Boston, Mass., have been awarded the contract at $28,446 for surfacing the main portion of the Charles River Dam at Cambridge for the Charles River Basin Commission. Bids for this work were opened April 4 and the itemized bids received will be found under Contracts Let in this issue.

MINNESOTA.

Contracts for State ditch work, bids for which were opened April 15 at St. Paul, have been let as follows: No. 89, located in St. Louis County, Minn., contains 112,757 cu. yds. suitable dredge work, O. F. Doyle, at 8.9 cts. per cu. yd.; No. 93, located in Aitkin County, Minn., contains 65,569 cu. yds. suitable dredge work, Kohler Contracting Co., at 7.88 cts. per cu. yd.

Bids were opened April 11 by the Board of Water Commissioners of St. Paul, Minn., for dredging the West Arm of Vadnais Lake, situated about seven miles from the City of St. Paul, the work consisting of about 1,500,000 cu. yds., the material being mostly vegetation and peat. The La Crosse Dredging Co., 2103 Colfax ave., Minneapolis, Minn., was the low bidder at 13½ cts. per cu. yd.

NEW JERSEY.

The Newburgh Dredging Co., Newburgh, N. Y., was awarded the contract for dredging in the Shrewsbury River, N. J., at 26 cts. per cu. yd. The work is to be done for the U. S. Government and includes about 15,000 cu. yds. of earth excavation. The bids of 85 cts. and 97 cts. per cu. yd., received at the same time for dredging in the Passaic River were rejected as excessive.

OHIO.

Bids are asked by the Director of Public Service, Ashtabula, O., until noon, Apr. 27, for improving Ashtabula Creek at Ashtabula, according to the plans and specifications on file in his office. The work includes, approximately, 360,327 cu. yds. of earth excavation; 136,487 cu. yds. of rock excavation; 2,160 lin. ft. of "I" beam bulkhead. A. J. Richardson, Ashtabula, O., is Clerk Public Service Department.

TEXAS.

The J. W. Maxcy Co., H. de B. Forbes, General Superintendent, 301 West Broad St., Texarkana, Tex., has started work on its Bowie County road contract, which comprises the construction of about 50 miles of county road and about 10 miles of city streets. The J. W. Maxcy Co. want teams for slip and wheeler scraper work and might consider subletting a portion of the grading.

Bids are asked until noon, May 10, by the Commissioners of Brazoria County Drainage District No. 3, F. M. Ragland, Chairman, at office of County Judge, Angleton, Tex., for following work: Ditch No. 1, 497,394 cu. yds.; Ditch No. 2, 31,241 cu. yds.; Ditch No. 3, 20,788 cu. yds.; Ditch No. 4, 26,300 cu. yds.; Ditch No. 5, 35,228 cu. yds.; Ditch No. 6, 51,093 cu. yds.; Ditch No. 7, 104,327 cu. yds.; Ditch No. 8, 11,850 cu. yds.; No. 9, 17,001 cu. yds.; No. 10, 38,142 cu. yds.; cut-offs on slough, 26,660 cu. yds. Also for seven miles of slough to be cleared, wet excavation, 122,000 cu. yds. Plans and specifications may be seen at office of A. R. Leckie, Engineer in Charge, Bay City, Tex., and with T. W. Carlton, Alvin, Tex., and County Judge, Angleton, Tex. Bids will be received for whole work complete or for any division. Official advertisement will be found elsewhere in this issue.

ONTARIO.

Bids are asked until noon, April 27, by A. McArthur, Clerk of Council, 31 King St., Chatham, Ont., for constructing an outlet drainage work. The drainage work begins at the Chenal Ecarte in the Township of Dover, and continues in the bed or course of

Items Concerning Contractors and Their Work

RAILROADS, POWER DEVELOPMENTS, LEVEES, DRAINAGE AND IRRIGATION WORKS

(Confirmed Reports Continued.)

what is commonly known as Maxwell Creek, through parts of Dover and Chatham Township. The engineer's estimate (exclusive of bridges and incidental expenses) for excavating by dredge work, is about $31,400.

Bids are being asked by L. K. Jones, Secretary Department of Railways and canals, Ottawa, Ont., for two contracts for work on the Trent Canal. One of these contracts calls for the construction of works connected with Sec. 6 of the Ontario-Rice Lake Division and bids for it will be opened April 26. The contract calls for the construction of Sec. 4 of the Ontario-Rice Lake Division. Bids for this latter work will be opened May 5. Plans, specifications and the form of contract can be seen at the office of the Chief Engineer of the Department of Railways and Canals, Ottawa, and at the office of the Superintending Engineer, Trent Canal, Peterboro, Ont.

Alabama Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Birmingham Railway, Light & Power Co., of Birmingham, has applied to the City Council of that city for a franchise to build its Corey extension, connecting the lines at Ensley with the new city of Corey. The company will build a single or double track with overhead trolley wire, the work to be started immediately and completed within twelve months. The line is to extend from 27th street and Avenue E in a southwesterly direction to 34th street and Avenue C.

Residents of Attalla have applied to the City Council of Gadsden for a franchise from the city limits for a street car line. As proposed the line will connect Attalla and the new plants of the Southern Iron & Steel Co. at the city of Gadsden. It is estimated that the road will cost $100,000.

D. B. Lacy, Anniston, has been awarded the contract for grading the new Louisville & Nashville R. R. yards at Paris, Ky. The contract calls for 100,000 cu. yds. grading and amounts to about $55,000. Work is to be started at once.

Out of town capitalists have applied to the City Council of Gadsden for a franchise and propose to build a street car line to the top of Lookout mountain. It is the intention to connect the mountain with the steel plant, and make it possible for those employed at the big industry to have homes on the mountain.

Arkansas Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Ouachita Power Co. has an application before the State Board of Railroad Incorporators for permission to build a dam across the Ouachita river at or near Ross Ford.

The Marianna, Aubrey & Western R. R. Co. has been granted 18 months' additional time in which to complete its lines. The road is to extend from Marianna and intersect with the Missouri and North Arkansas R. R.

The project for extending the Arkansas, Louisiana & Gulf Ry. north from Hamburg to Hazen on Devalls Bluff, via Pine Bluff, has been revived and it is possible that construction work will be begun this summer. J. M. Parker, Hamburg, Ark., is Chief Engineer.

The Fort Smith & Van Buren Ry. Co. of Fort Smith, has been chartered with a capital stock of $250,000, the incorporators being Samuel McLoud, R. S. Robertson, W. D. Pratt, John C. Gardner and J. B. McDonough. The road will extend from Fort Smith to Van Buren on the opposite side of the Arkansas River.

California Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

All right of way has been secured for the proposed Modesto-Stockton electric line, and it is reported that the promoter, Morris Brackett, has secured the necessary construction capital in New York. O. B. Parkinson, Stockton, is attorney for Br. Brackett.

The Atchison, Topeka & Santa Fe Ry., H. C. Phillips, Chief Engineer, Los Angeles, is to establish a new division point at Riverbank in Stanislaus County. It is understood that this company will establish yards there capable of accommodating 2,000 cars. About $300,000 will be expended.

The Grant Brothers Construction Co., Los Angeles, is to resume work on the construction of the Southern Pacific branch line along the west coast of Mexico, which was discontinued some time ago. The road will run through a section of Mexico which at present has no railroad facilities, and will open this domain up to the trade of the United States, particularly California.

The Southern Pacific Ry. has commenced preliminary work on laying out new yards and building new depots at Stockton. The work will involve the expenditure of $500,000.

Erickson & Petterson, who have the Southern Pacific cut-off contract between Rocklin and Clipper Gap, have let the sub-contract to build the Dutch Ravine road to Joseph Correa, Jr. The road is about two miles long and the estimated cost is $15,000.

Plans have been completed for an electric railway connecting Hemet, San Jacinto and Moreno, and applications have been made to the towns of Hemet and San Jacinto and the Supervisors of Riverside County for franchises. The line is to be 35 miles long, and it is intended to operate it with storage battery cars. J. S. Jackson, of San Jacinto; H. E. Munn, R. J. Waters, of Los Angeles; H. E. Hubbard, of Redlands, are interested.

The Northern Electric Co., whose electric railway runs two miles from Gridley, is said to be considering building into that city. The plan proposed is to build from the main line at a point near Ord ranch, in a southwesterly direction, to the northern limits of the town near the Southern Pacific track.

Advices from Sacramento state that work is progressing all along the line of the Central California Traction Co. Track laying from the Sacramento end has begun and will continue until the line is completed. The grading crews are now in the vicinity of the Cosunnes River.

George West, of San Bernardino, has begun work at Fairview, Ariz., on his contract for double tracking the Santa Fe from that city to Ash Fork. This is the second Santa Fe contract he now is working on; the first extending from Barstow to Cottonwood, will be completed soon.

Colorado Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Kilpatrick Bros., Beatrice, Neb., are reported to have the contract for constructing a branch of the Union Pacific from Wamsutter, Wyo., to Craig, Colo. It is said that the branch will be built this summer, and that some of the work has already been sublet to Reinhardt Bros.

C. A. Hull, of Salida, General Manager of the O. J. Mining & Development Co., has started excavation on the 3,000 ft. mining tunnel through Big Four mountain in the Cleora district, situated about three miles east of Salida. The amount of money to be spent in this enterprise is $100,000. The tunnel will pierce the base of the mountain, which is 1,000 feet high.

The Arbuckle Reservoir Co. has filed its articles of incorporation at Boulder. The company has a capital stock of $25,000, and its directors are: C. P. Howard, T. N. Callahan, A. L. Gibson, Joe Lee and J. D. Bashor, all of Longmont. The company was organized to acquire a system of reservoirs in Boulder County near the base of Long's Peak.

W. H. Everle, Denver, is planning to construct the Comanche-Kiowa irrigation system in Adams and Weld Counties. It will include the Wolfe and Baker reservoirs, Wolfe, Kiowa and Comanche ditches and irrigate 20,000 acres.

Construction work is under way on the Union Pacific branch line, which is to extend from LaSalle to Dacona, a distance of 25 miles.

The Kenefick, Quigley, Hoffman Co., who have the contract for constructing the De Weese irrigation project, as previously mentioned in these columns, have awarded a subcontract to Charles Dittmer & Co., of Pueblo, for the construction of a tunnel for the main canal through a mountain ridge near Grape Creek, four miles south of Canon City. This tunnel will be 1,600 ft. in length, and work has already been started.

The Denver, Laramie & Northwestern R. R. has completed the road bed for its extension from Milliken to Greeley, a distance of 12 miles. The steel is now on its way and track laying will be started by the company at once.

Final surveys are reported to have been started by the Arnold Co., Chicago, Ill., for the Paradox Valley R. R. The Pacific Construction Co., Carmon Layton, President, Montrose, is to construct the line.

The Denver Tramway Co. of Denver, through the Denver Realty Co. and others, is said to be purchasing considerable land along the terminals of the Moffat road, with the intention of ultimately extending its lines to Utah Junction.

MORRISON TENT & AWNING CO., 115-117 OLIVE STREET ST. LOUIS, MO.

Georgia Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

Surveys have been started by George Harris for a railroad to be built through the western portion of Carroll County, joining the Central of Georgia at Carrollton and extending twelve miles out to Bowdon.

The Bowdon R. R. Co. of Bowdon, has been incorporated with a capital stock of $60,000, and proposes to build a line to run in an easterly direction to some point on the Central of Georgia Railway in Carrol County or to some point on the Southern in Haralson County. The length is to be approximately 15 miles. The incorporators are: J. L. Lovvarn, H. J. Reaves, J. M. Barrow, R. M. Lovvarn, O. P. Bennett, John W. Eason, W. T. Bech, J. B. Fowler and W. T. Johnson, of Carroll County, and J. M. Terrell, of Merriwether, and Thomas J. Lovvarn and G. W. Taylor of Randolph County, Alabama.

Idaho Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Oregon Short Line R. R., Wm. Ashton, Chief Engineer, Salt Lake City, Utah, will probably start construction work about June 1 on a line from Ashton, Idaho to Driggs, a distance of 40 miles. Ashton, from where the branch is to be built, is fifty-one miles from Idaho Falls and 56 miles from Yellowstone Park station. It is the intention to begin work upon this branch, in so far as the grading is concerned, early this summer, and this part of the work will be completed this year ready for the ties and steel.

Illinois Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Wabash R. R., A. O. Cunningham, Chief Engineer, St. Louis, Mo., is said to be planning to rebuild the Shumway-Effingham line, abandoned for several years, and put it into use. It is also planned to improve the shops at Decatur, and to build new ones.

Track laying on the Woodstock-Sycamore Traction Co.'s line between Sycamore and Woodstock has been started at Sycamore. Over four miles of grading toward Genoa has been completed by the contractor, John Seymour, and it is expected to have the line in operation to Genoa before July 1.

The directors of the East St. Louis, Columbia & Waterloo Ry. have increased the capital stock of the company from $10,000 to $1,000,000, and have moved the offices of the company from Columbia to East St. Louis. It has been decided to begin work on the proposed electric road as soon as matters can be arranged. The work is to begin at East St. Louis, and the contracts for grading are to be let at once, it is said.

The Chicago, Rock Island & Pacific Ry., J. B. Berry, Chief Engineer, Chicago, Ill., is to expend $4,000,000 this year for laying new track, renewing old track, for ballasting roadbed, for steel ties and for enlargement of terminal facilities. The company has ordered 35,000 tons of steel rails, which will cost close to $1,000,000. This will lay over 260 miles of main line, and the rail which it supplants will be laid on the lighter divisions and on branch lines. About 100 miles of the main line from Chicago south will be laid with steel rails weighing 100 pounds to the yard. Up to date the company has decided upon the reballasting of the main line tracks, which will cost approximately $800,000.

Plans are in progress it is said for extending the Alton, Jacksonville & Peoria Ry. so that an entrance into St. Louis can be secured over the Alton bridge and the Burlington R. R. tracks. W. R. Heagler, Alton, is Chief Engineer.

Indiana Notes.

FROM CORRESPONDENTS AND OTHER SOURCES.

The Indianapolis, Newcastle & Toledo Traction Co. has applied to the Board of Public Works of Indianapolis for permission to enter the city by way of 19th St. and Parker Ave. to the end of the Brookside Ave. car line at Brookside Ave. and 18th St. The company expects to build tracks through a subway under Sherman drive and the Belt railroad track, then follow 19th St. and Parker Ave. to the Brookside Ave. line.

The construction of an electric line to connect Bremen and Mishawaka is proposed Omar E. Neff, Milford, Ind., is interested.

The Walsh Construction Co., Davenport, Ia., has six steam shovels at work on its contract for constructing the Evansville-Mt. Carmel line for the Big Four. Two shovels are working at Cynthiana, two at Evansville and two at Mt. Carmel. It is expected to have the work completed by November.

The Foulkes Contracting Co., of Terre Haute, has been incorporated with a capital stock of $25,000, and will engage in a general contracting business. The directors are: G. C. Foulkes, P. G. Lindeman and C. L. Foulkes.
